S. B. H, CRAWFORDSVILLE, IND.—In the Harrow Special one of the questions was, "What harrow would be preferred if the farmer was confined to the use of one harrow?" It was a new and unsupposable question to me. To confine oneself to one harrow on the farm in this day of advanced agriculture seems as unprogressive as it would be to persist in using the wooden toothed harrow of 50 years ago made out of a wooden crotch. Since the Harrow Special was published I have added Clark's Cutaway to my stock of harrows with a seeder attachment, and have sowed my oats with it. From the method of preparing the ground and sowing oats 30 years ago to the present mode the advance is almost as great as from the cradle to the self-binder in harvesting wheat. I have helped to cut the corn-stalks with a hoe, then rake them together with a hand-rake, or a rudely constructed horse-rake, and burn them. To-day we are sowing in corn-stalks, just as the cattle have left the field and are doing the work well. If a sulky plow should be put in the field, that would turn over a furrow about three feet wide with a seeder and harrow attachment, by which the plowing, seeding, and covering would be done at the same time, it would not do more in sowing oats than the Cutaway harrow is doing today with less power than is required now to turn a 16-inch furrow with the average sulky plow with three horses. While the individual farmer is greatly benefitted by such labor saving implements, the nation collectively has a still greater interest in them. During the past dozen years agriculture has been greatly depressed in England, because the British farmer could not compete with the more cheaply grown grain of the American farmer, and the latter is now closely pursued by the ryot of India, and the farmers of South America and Australia. While we have cheap lands and a vast extent of them, Australia and South America and other parts of the world have lands just as cheap, and still greater in extent, and our geographical protection as against those distant countries, in the markets of Europe, is very small. It does not amount to 10 cents on the wool of a sheep, or to two dollars on the wheat of one acre of land. To have to sell our agricultural products at a small advance on the cost of producing them has its inconveniences; but it is not such a calamity to the nation as to be driven from the markets of the world, because other nations can undersell us. We have been able to hold our own against the seven-cents-a-day labor of India on account of labor-saving machinery, and our skill and aptitude in using it. It is with this larger view of promoting the general welfare that we should welcome the advent of any and every labor-saving implement.

DEFENCE OF WYANDOTTES,

G. W. F., DUNLAP, MO.—The RURAL has done some very good work in the poultry interest. It has given some very good hints on breeds and given some hard blows to a few which were advertised as wonderful new varieties. I remember a year or two ago, the remarks about as follows; "The RURAL now reluctantly gives up the Wyandotte, after a thorough test, to try other breeds. Their one fault, if fault it may be, is that their eggs are rather small for the size of the fowl." I was breeding the Wyandotte at that time and like them even better now. I find that they lay eggs as large as those of the Langshan, but not so large as those of a Brahma or Cochin; but what they lack in size is made up in number. On a free range the Leghorns may excel in the number of eggs; but in a close run, I have never seen any bird that could beat the Wyandottes. They have only to be seen to be appreciated. They are medium in size, fine in form and plumage, good table fowls, having yellow legs and skin, and they are easily reared, docile, fine mothers and sitters and are as near to being all-the-year-round layers as can be found. They are becoming great favorites wherever known, making broilers as early as any other variety. They are destined to fill the long felt want on the farm for a general-purpose fowl. They have low, compact rose combs which never freeze. A hen with a frozen comb does not lay till the comb gets well, which takes a long time in winter. Score the Wyandotte two points ahead.

KILLING MILDEW.

J. N. L., HAW PATCH, IND.—Here is my way of killing mildew and aphidæ, and my wife and I think we know something about roses as we have over 200 hardy ones. We keep mildew down and kill it with soap-suds. I use the soapy water after the girl has washed the clothes, and at other times one tablespoonful of soft soap to four gallons of water. Mildew is not bad with me; I never have any on grapes or gooseberries. I have used it two years on roses and so far I have not had a failure except upon two—Her Majesty and Puritan. I think they are the only really worthless roses that I have ever seen. I have had them both since their introduction and therefore know that they are failures. Of the emulsion I use to kill lice, one needs only a small quantity. It is more easily and quickly made than any other, and I imagine it hurts the foliage less. I know that it will kill the pests on roses, cabbages, plums, and cattle: Take eight eggs (whites and yelks) beaten thoroughly, then add a small pint of kerosene. Stir with a stick for a minute (or less) or until the stuff is well mixed; then add four gallons of water. Pump with a force-pump for a moment and it is ready to use. I am more interested in the RURAL'S rose experiments than in all the others and am hoping that it will make a success of the business, and when any of the new roses are put upon the market I shall be glad to buy them.

TOMATOES.

G. H. S.—In about twelve years' experience in growing tomatoes I have noticed several conditions in the growth of the fruit, which may suggest to the RURAL editor the cause of his yellow tomatoes from artificial fertilizer. Not understanding chemistry, I am unable to offer any opinion, so I merely record facts. On poor sandy soil with complete fertilizer, having South Carolina rock as a base, the fruit was similar to that grown by the RURAL. On the same kind of soil, with a small amount of farm pen-manure in the hill, the plants stood upright, produced continuously until frost medium-sized fruit of good color and very little acidity. In loam with, say, a peck of rotted manure per hill the plants fell over, but bore heavily, the fruit gradually diminishing in size till frost. Color good, quality ditto, both gradually deteriorating as the season passed. In heavy loam, heavily manured with poultry droppings, the plants were very luxuriant, the fruit set all at one time, and was gone in a short time. Color good, quality acid. I might say that lack of vegetable matter in the soil causes yellowish-red tomatoes, but I do not know.

LIKES GOOD CATTLE PICTURES.

W. P. W., MONROE, WIS.—The RURAL has a right to call particular attention to the fine animal pictures which grace the issue of March 23d—as well as the information given in the accompanying article. Indeed the RURAL'S pictures of animals have nearly always been very much better than any I have seen in similar publications. Some reproductions from English periodicals, however, were too fine. Such animals as some of them represented probably never existed. I inclose a sample.

R. N.-Y. We should say that the artist who drew the picture inclosed in this letter took for his model a block used in a "Noah's Ark" collection]

S. E. H., GREELEY, COL.—Several acres of bottom land were overflowed by seepage water; as a consequence the kind of flag known as cat-tail occupied the land. After opening ditches to drain it, a portion of it was surrounded by a barbed-wire fence made to hold in swine. This fence was three feet high and had five wires. Into this inclosure the swine were turned during the summer. They uprooted the flags and ate the roots as readily as they would potatoes. They nearly cleaned the cat-tails off that ground. I fed them only about half rations while the roots lasted. They did not fatten but kept in a fair condition, being breeders.

What Others Say.

"THE CONCENTRATED FEED FOR HORSES, CATTLE, SHEEP, SWINE, POULTRY, ETC."—Manufactured at Pearl Mills. For sale by the Concentrated Feed Co., 33 Wendell St., Boston, Mass.

"There has been nothing invented for years," says the manufacturer's circular, "which has proved such a blessing to all classes of domestic animals as the above feed."

The directions which accompany this feed, show that it is offered as a medicinal or condimental food. Thus we read, "For an ordinary working or driving horse feed one single handful of the feed with one-fourth less his usual allowance of grain at each feed, wet or dry. For worms, twice the quantity for five days." For cows, "feed one half-pint or single handful of the feed with the usual amount of grain, wet or dry. For garget, feed twice the quantity until it entirely disappears." Still more startling is the announcement, "this disease," hog cholera, "in its most malignant form yields readily to the free use of the Concentrated Feed." Following the claims of the seller and the directions for use are the usual number of testimonials from those who have used the feed with satisfaction. This material, or a similar one under the same name, has been sold more or less in the State since 1882, and in the report for 1884, page 111, its merits were fully discussed. During the present year a sample was received from W. H. Hammond, Hampton, Conn., who says in regard to it: "The cost price is six cents per pound and it is in 12-pound bags to be sold for $1.00 or eight cents per pound." "The above price" (six cents per pound), "is as given me at ton lots, or three tons for $300." "I have tried it and think it not up to the mark as advertised in their circular." The sample sent by Mr. Hammond was analyzed and reported to him and was also published in the weekly statement No. 41, of September 15. The analysis made by the Connecticut Agricultural Experiment Station, from which we are quoting, is as follows:

	Concentrated Feed.	Wheat bran.
Water	11.39	12.38
Salt	13.20	....
Other mineral matter	4.11	5.59
Albuminoids	14.87	15.36
Fiber	4.48	9.34
Nitrogen-free extract	47.42	53.50
Fat	4.42	3.83
	100.00	100.00

This "invention" which has proved "a blessing to all classes of domestic animals," apparently consists of a mixture of wheat and corn with 13 per cent. of salt and perhaps a little of some more concentrated feed. Disregarding the salt, an equal weight of wheat-bran would supply as much nutriment and would cost perhaps $20.50 per ton. The "invention" costs $100 per ton in three-ton lots, or at the rate of $160 per ton in small quantities.

THE CONCENTRATED EGG-PRODUCER.—made by the Concentrated Feed Co., No. 14 Wendell St., Boston, Mass. A sample of this material furnished by Mr. Hammond, of Elliot, had the following composition:

Water	10.15
Salt	17.20
Other mineral matters	6.40
Albuminoids	14.19
Fiber	3.37
Nitrogen-free extract	44.94
Fat	3.75
	100.00

The mineral matter contains a quite insoluble oxide of iron. The Egg-Producer has a somewhat lower feeding value probably than the Concentrated Food for Cattle. It contains both corn and wheat and some more concentrated feed. Wheat-bran contains, pound for pound, as much nutriment. The cost of the Concentrated Egg-Producer is 50 cents a pound or a dozen pounds for $4.00. This latter price is equivalent to $660 per ton.

As food, neither the Concentrated Feed for Cattle nor the Egg-Producer is worth more than a small fraction (about one-fifth in the case of the Feed for Cattle and one-thirtieth in the case of the Egg-Producer) of what it costs. As condiments they are worthless. It has been abundantly proved that condimental foods have no advantage over others by reason of the condiments in them.

As medicines, they may well be distrusted in view of the absurd claims made by the seller.

Our respected London contemporary, Bell's Messenger, of late date, has the following:

CANADIAN PHOSPHATES.—We may claim some credit for being the first to point out that the ominous cry of the manure manufacturers as to the future supply of phosphates for manure ought to be met by the development, by British capital, of the rich phosphate lands which exist in the valleys which run down to the Ottawa river, in Quebec. Our views have received very emphatic confirmation in three publications which have reached this country during the past week. Our able contemporary, the RURAL NEW-YORKER, in the number which reached this country on Tuesday morning, had a cartoon which is applicable to farming in any part of the world. A rough, unkempt fellow, who is labeled "Bad Farming," is engaged in the brutal pastime of murdering a beautiful female—"Mother Earth." Three stalwart young fellows with clubs are depicted as coming to the rescue of the beautiful damsel, and their clubs are respectively labeled "Phosphoric Acid," "Potash," and "Nitrogen." It is a picture that embodies a great truth, it may be in slight caricature, but still, the truth.

It is evident that the Americans are at last waking up to the fact that their farming is wasteful, exhaustive to the soil, and very much after the style of killing the goose that lays the golden egg. With this awakening will come a demand for those plant foods to which we have drawn attention, which will very seriously affect the supplies to the manure manufacturers of this country. It is well that we should realize this and take steps to see that all available supplies are controlled by British capital for the benefit of the agriculture of our own empire. The Geological Survey of the United States has just issued a report on the nature and origin of deposits of phosphate of lime, which shows clearly that the leading men of that country are alive to the question, and know that the future supplies of that country must be largely drawn from the apatite beds in Canada. These—although at present but little developed—are described as the richest and best phosphatic resources in the world. The South Carolina phosphatic rock is placed second, but the story of the difficulty of mining is told in a manner that is unmistakable. Owing to the exhaustion of the guano deposits in South America, the future supply of phosphates is a matter of doubt. We must have them if British agriculture is to be maintained in its present perfection. To make any show at all in her agriculture, the United States also must soon be a big user of these manures. Our nearest colony is our present hope, and we trust that her lands will be developed for the benefit of British agriculture and not for that of the United States—a country which is so keen a competitor with our own agriculturists.

But it is well to know that the highest scientific authorities in the United States place the Canadian phosphate desposits in the place of honor as the richest and best in the world.

BOILED DOWN AND SEASONED.

MR. ANDREW BURNETT, of Wellesley, Mass., as recorded by the New England Farmer, is a believer in hornless cattle. The head of his herd is a bull, half Holstein and half Jamestown (polled) all of whose calves are hornless. The bull has horns which were loose and movable up to six months ago, when they hardened and became fixed.....

ONE of Mr. Burnett's curiosities is a cow which is one-quarter deer and three-quarters Jersey. Her mother was a cross between a Jersey cow and a buck deer. She is a very large milker, with remarkably gentle disposition, but very timid and easily disturbed at the presence of strangers.....

MR. BURNETT thinks that he can keep silage even 10 years in his silos, and that by having enough to keep over he may help out a dry season or be able to average an extremely productive season with one that is less so.....

MR. C. S. COOPER thinks well of the Patagonians. He is an experienced poultry raiser. His eggs were received from the same source as were the RURAL'S eggs. These, as our readers know, gave us a grand mixture.....

THE R. N.-Y.'s Red-caps lay a fair-sized egg the shell of which is of a chalky whiteness. We don't become reconciled to their top-heaviness .....

PROF. BEAL says that a large spoon heaping full of pure Paris-green to 40 gallons of water is enough for use on apple trees. He reminds Farm Journal readers that unless applied at the right time, no good can follow.

APPLE POMACE, says Dr. Johnson, of the Conn. A. E. S., is prized by those who have it as a food for cattle and horses. A sample analyzed which was free from straw and consisted wholly of the apple "cheese" from the cider press, contained about as much albuminoids, 10 per cent. more carbohydrates and four times as much fat (ether extract) as green fodder maize. It had a faint vinous smell and contained about a quarter of one per cent. of free acetic acid. Ensilaged like maize fodder, it would be a valuable winter feed .....

THE Connecticut Report above alluded to says that repeated trials have shown that old corn of the best quality weighs from 58 to 59 pounds per struck bushel, while a bushel of the best new corn weighs only 50 to 52 pounds. The valuation of the new corn is about $1.45 per ton less than that of old corn, which represents a difference of four cents per bushel; and this seems to be about the difference made in dealers' quotations.....

PETER HENDERSON, in alluding to the fine effect that the past mild, bright winter has had in strengthening hot-house plants, in preventing mildew and damping off, says, in the American Florist, that the nearer we can get the roof of a green house to an unbroken sheet of glass the better; that the glass should be kept clear from snow, dust, or anything that will obstruct light, and that the roof should be placed—if the crop of fruit, flowers or vegetables is to be forced in winter—so that it will get the greatest amount of the sun's rays .....

THE question as to the best time to prune fruit trees was discussed at length at the meeting of the Iowa State Horticultural Society two years ago, and a resolution was passed by unanimous vote favoring the idea that the best time to prune fruits is when the leaves are about two-thirds grown in spring. So says Prof. J. L. Budd, in our esteemed contemporary the Farmers' Review. Members seemed to unite in the opinion that the wounds made at this time would heal rapidly and perfectly, and that the vitality of the tree is lowered less than at any other time. But the pruning in orchard and nursery cannot all be done in one day, so in a general way we can say, prune lightly at any one time from the time when the leaves have attained nearly full size to the completion of the first extension of growth in early June.....

HUNGARIAN BROOME-GRASS—Bromus inermis. This is one of the most promising new grasses in the garden of the Connecticut Agricultural Experiment Station. It produces an abundance of tender foliage, spreads quite rapidly by stolons, comes up quickly after cutting and, last winter, was perfectly hardy. It is said to grow on very dry soil. Hard frosts do not kill the foliage.....

A MARSH grass, Phalaris arundinacea, or Reed Canary Grass, has grown very vigorously. The Striped Grass of gardens is only a variety of this. On low, swampy land this may be a very valuable grass. It is rather coarse, but is relished by cattle, comes quickly after cutting and is not killed down by frost. It is easily propagated from the stout under-ground stems. On cultivated land it might become a pest.....

THE tendency of the times is toward the cheapening of everything consumed by mankind, says Dr. Hoskins, in the Vermont Watchman. The farmers cannot escape this tendency. They demand cheapness in what they buy, and those who buy of them naturally make the same demand. It is inevitable. It behooves every man to understand this truth. Only by understanding it can we prosper. Our safety is in learning how to produce everything from the farm as cheaply as possible. We must not expect, either, that all we save by these methods we can always keep. Those who "catch on" early will make money; but in the long run the public will get the benefit of all improvements. Yet we have to go on improving, or be crushed.....

GREAT Gracious, Mr. Harris! one ton of fertilizer to the acre for asparagus and, then, the next season, 700 pounds of nitrate of soda? He might just as well have recommended 700 pounds of the nitrate *every* spring, for the reason that little of it would be left from year to year.....

MR HARRIS, wisely as we think, advises, in the American Agriculturist, that the plants be not set closer than three feet by 10 inches.....

DR. THURBER having tried many of Rogers's hybrids, concludes after his years of experience that Goethe is the only one that with him still holds out of value. It is strange how two experimenters, having no other motive than that of serving the public, may arrive at opposite conclusions. The Goethe at the Rural Grounds (seven miles from Dr. Thurber's) is, in three seasons out of four, of no value at all. The bunches are loose, the berry tart and late in ripening.

ECKFORD'S new sweet peas are probably the finest strains of this interesting flower. The flowers are nearly twice as large as those of any of the old kinds, while the combination of colors and the beautiful markings render them of the first value as cut flowers.....

"BRILLIANT" is advertised as the first really fine red pansy.....

President W. H. Bowker says, in the New England Homestead, that "corn is a great surface feeder and *for that reason* the fertilizer should not be plowed in deep but *applied near the surface.* Professor C. V. Mapes, in the American Agriculturist, says that "if the fertilizer is kept *too near the surface*, notably with corn, the roots will be developed near the surface, and their presence there will prevent surface cultivation, so necessary during a dry season, without damage by cutting the roots. High-grade, complete fertilizers, as a rule, should be well broadcasted and harrowed in, after plowing, and worked in *to the depth of five or six inches*, so that the root development of the crop will extend from each plant as far as possible in every direction".....

THE R. N.-Y. would say, if it might venture to speak in such distinguished company, that if the fertilizer is harrowed in two or three inches, the early and usually abundant rains of spring would hardly fail to carry the soluble constituents down where they would best feed the plants, and that by the time the roots take possession of the land, the fertilizer would have very little effect to induce a growth dangerously near the surface.

YOU can buy one dozen mixed gladioli corms for 40 cents .....

TRY the new double white Phlox Drummondii.....

ABSTRACTS.

——AMERICAN FLORIST: "Some little Bantam fowls had the run of the rose houses. 'Capital things they are too. They don't do any harm, but they do a great deal of good in picking up grubs and other vermin.' So says Mr. Thorpe."

——"SIEBRECHT says 'of all orchids, either for private or commercial purposes give me first, cattleyas; second, phalænopsis; third, odontoglossums.'"

——NEW YORK HERALD: "'Curious,' said she, musingly, 'that agricultural editors are generally such young men. The Ag. Ed. ought to be Ag-ed, you know.'"

——IF you would get the cream of the R. N.-Y., don't skim it.

——VERMONT STATE JOURNAL: "What we need most is not larger farms, but larger farmers. Has any man a right to more land than he knows how to farm to profit? Has he a right to misuse and depreciate that by which the nation must live?"

——WESTERN RURAL AND STOCKMAN: "Congressmen want more money. They say that their salaries are not sufficient to enable them to live in Washington. Gentlemen, the most of you get a good deal more than you are worth already. Some of you get just five thousand dollars more than you are worth."

——NEW ENGLAND FARMER: "If you would dry your soil, stir deep and often; but if you would retain its moisture, stir only the surface."

For Nervous Debility

Use Horsford's Acid Phosphate.

Dr. H. T. TURNER, Kasson, Minn., says: "I have found it very beneficial in nervous debility, from any cause, and for indigestion." —*Adv.*

Miscellaneous Advertising.

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

$20 FENCE MACHINE FOR $10

Freight paid. *Guaranteed.* Hundreds in use. Circulars free. S. H. Garrett, Mansfield, O.

PARALLEL LINES.

EVERY student knows that in close reasoning parallel lines of thought are laid down and deductions educed.

It is not our purpose at this time to enter into a learned discussion, and we have drawn the above visible lines simply to bring them prominently before your eye and to ask what they represent to you.

A railroad man to whom we showed them said: "To me those four lines represent a double-track railway."

A doctor replied to the same interrogatory: "The lines are to me the large arteries and veins lying alongside each other in the human body."

As will be observed the same lines to either gentleman suggested different lines of thought, as both looked at them through eyes accustomed to see only that which for the most part occupied their attention. To the writer both answers put an old truth in a fresh and original light.

As every intelligent man or woman knows, the blood of every living person flows with almost railroad speed through the arteries, forced by that wonderful engine, the heart. From the arteries it is side-tracked through the capiliaries and veins, and every drop of blood goes through the kidneys for purification no less than 2,500 times every twenty-four hours. If the kidneys be diseased the impurities of the blood containing the worn-out tissues, and deleterious acids are not drawn out or excreted as nature intended, but continually pass and repass through every fiber of the system, carrying death and decay with every pulsation. Unless remedied the heart becomes weakened, the lungs trying to do double work break down, the liver becomes congested, the stomach refuses to digest food and the result is a general break down.

Why?

Because the kidneys, the sewers of the system, are foul and stopped up, and the entire blood becomes nothing more nor less than sewage.

Now is it not criminal, nay, suicidal, to allow such a state of things to continue when a simple remedy is within your reach, known for a certainty to do as represented, which will open the closed pipes of the kidneys, allow the effete matters to escape, relieve the overworked heart, lungs and liver, cause a healthy appetite, put the bloom of health in your cheek, the dove of hope in your breast and the light of life in your eye?

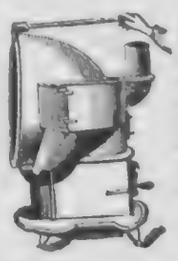
You already have divined the remedy we have reference to; its praise is universal, its influence world-wide. Do not allow prejudice to blind you to your best interests, but to-day procure Warner's safe cure and be put on the straight road to rude health and correct living.

Our parallel and closing lines to you are, take our advice and your experience will justify you in thanking us for bringing under your notice a remedy without a parallel.

IMPROVED EXCELSIOR INCUBATOR

Simple, Perfect and Self-Regulating. Hundreds in successful operation. Guaranteed to hatch larger percentage of fertile eggs at less cost than any other hatcher. Send 6c for Illus Cata. GEO. H. STAHL, Quincy, Ill.

CHARMING NOVELTY.—Lamp shade in the form of Toy Buildings. Landscapes with illuminated cottages. Price, 12c. each; 10 shades, $1.25, $2; carriage free; payable in advance in stamps or money orders of any country. 100 shades, $4.50, including packing, taken at factory. In 8 days more than 10,000 were sold. H. KUMSS, Warmbrunn, Silesia, Germany.



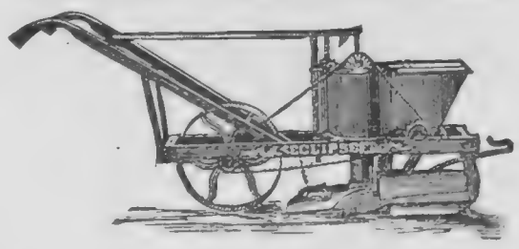
PROFIT FARM BOILER!

With Dumping Caldron, empties its kettle in one minute. The simplest and best arrangement for cooking food for stock. Also make Dairy and Laundry Stoves, Water and Steam Jacket Kettles, Hog Scalders, Caldrons, Etc. Send for circulars.

D. R. SPERRY & CO., BATAVIA, ILL.

PEERLESS DYES Are the BEST.

ECLIPSE CORN PLANTER.



Will plant Field and Ensilage Corn, Beans, Peas and Beet Seed in **hills, drills** and **checks**—in hills up to 45 inches; in checks from 36 inches up to any distance desired. Will distribute all Fertilizers **wet** or **dry.** Farmers, send for circulars.

ECLIPSE CORN PLANTER CO., Enfield, Grafton Co., New Hampshire.

GROWERS AND DEALERS IN SWEET CORN, ATTENTION! Genuine Connecticut grown Stowell's Evergreen Sweet Corn by express, $2.25 per bushel, $1.25 per half bushel, 75c. peck. C. E. CHAPMAN, Westbrook, Conn.

GRAPE VINES

Nectar, Woodruff, Eaton, and all the best varieties. Gandy and other Strawberries. Blackberries, Raspberries, Wonderful Peach, and other nursery stock. Descriptive catalogue giving *Instructions for planting* free. JOEL HORNER & SON, Delair, Camden Co., N. J.

VEGETABLE PLANTS—Standard Sorts, at reliable rates. Send for Price List. M. GARRAHAN, Kingston, Pa.

FOR SALE CHEAP!

3 and 4-Year-Old Apple Trees. List of Varieties and prices on application. GRAY BROTHERS, New Canaan, Conn.

Strawberry Plants For Sale.

Haverland and Burts, $1.25—100; $8—1,000; Warfield, 75c.—100; $5—1,000; Jessie and Bubach, 75c.—100; $4—1,000; Gandy, $1.50—100; $10—1,000; Hampden $1.50—100; Summit and Monmouth, $1—100; by freight or ex. James Lippincott, Jr., Mount Holly, N. J.

Cold Frame Cabbage Plants.

500,000

Ready for planting. Send for prices. Address

for external and internal pains. This is better than to employ a physician who cannot do more for you if you had the wealth of Crœsus. Two sizes, 50 cents and $1.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, APRIL 20, 1889.

804

NAMES of women, as shown by the list in this issue, have entered for the Women's Potato Contest.

Taking the cash profits of the cows, exclusive of the manure, it is found that one cow paid over $35, *two over* $20, *five over* $15, *two over* $10, *one under* $5, *while one lost* $34. *Nine out of* 12 *therefore made a profit of below* $20. *The one bad cow that lost* $34 *reduced the average of the entire herd. Is there any such cow in your herd?* —page 272.

$25!

TWENTY-FIVE dollars are offered by the R. N.-Y. as follows: Fifteen for the largest and best shaped R. N.-Y. No. 2; $10 for the second best. Reports should be sent in before November next. Those entitled to the prize will be asked to forward the prize potatoes to the R. N.-Y.

"*On a free range the Leghorns may excel in the number of eggs; but in a close run, I have never seen any bird that could beat the Wyandottes.*"—T. W. F. page 266.

THE two new varieties, Mrs. Foraker and Gov. Foraker, as judged by several potatoes sent to us by M. Crawford, of Cuyahoga Falls, Ohio, are splendid keepers. They are shapely and as nearly white in color as any variety we know of.

"*Perhaps no crop is less likely to be injured by the wire-worm than the bean, and it is often grown with a good degree of success where the pests prevail, and if other conditions favor in the locality, would it not be well to plant a portion of the field to this crop.*"—page 265.

VERY, *very* busy times at the Rural Grounds. The season is extremely favorable for early work, and that is just what we are doing with a hearty vengeance. After the work is thoroughly done and in good season, it is restful to think about it.

"*We have been able to hold our own against the seven-cents-a-day labor of India on account of labor-saving machinery, and our skill and aptitude in using it. It is with this larger view of promoting the general welfare that we should welcome the advent of any and every labor-saving implement.*" —S. B. H. page 266.

NO DOUBT there are many names which have been sent to us that do not appear in the formidable list of women contestants presented in this issue.

If those whose names have been omitted will kindly advise us of the fact, the names will be printed in a supplementary list.

"*I sow so much ground that if drought sets in early I feel free to draw on the crop before it reaches its best. If, on the contrary, pasture keeps reasonably fresh and abundant, and there is likely to be an excess of the fodder corn, the second sowing is resorted to as soon as it has reached fair maturity, and the unfed part of the earlier crop is cut and cured for winter forage while the weather is yet warm and dry.*"—W. B. PRATT, page 265.

IN the biographical sketch of the Hon. Norman J. Colman, in the RURAL of April 6, it is said that "under his immediate direction the progress of manufacturing sugar from sorghum by diffusion was perfected and placed upon a paying basis." This statement has been strongly controverted. It is the RURAL'S earnest desire to be just—to give full credit where it is due, but only where it is due.

SPEAKING of the experiments in making sorghum-sugar by the National Government during the past year, at Rio Grande, N. J., Kinner, La., and Conway Springs, Douglass and Sterling, Kansas, Professor H. W. Wiley, Chemist of the Department of Agriculture, says all the conditions combined to render the manufacture of sugar on a small scale commercially unprofitable. At Douglass, Kansas, sorghum cane can be grown, which, with proper treatment, will yield from 80 to 90 pounds of sugar to a ton of pure cane. He thinks Southern and Western Kansas possess the best known climate for sorghum, though it is not unlikely that that of Texas, Louisiana, Arkansas, Tennessee and North Carolina may be equally favorable, but this remains to be proved by experiments. The Indian Territory will, in his opinion, be the center of the industry. The expectation of growing sorghum successfully in the great corn States, he insists, must now be indefinitely abandoned. A reasonably certain season of 60 days for making sugar from sorghum is an essential condition to profitable success. The water supply must be abundant, and the factories must be located close to the fields. A cheap supply of fuel is also indispensable. For this purpose the refuse chips of the cane can probably be used. A factory capable of working up 200 tons of cane per day would cost from $60,000 to $100,000. A smaller one would hardly pay commercially. A thoroughly skillful manager is indispensable in each factory. An average of 194 pounds of sugar can be made from a ton of cane by the diffusion process. It is evident from all the latest experiments, that the old idea that sugar can be profitably made from sorghum on every farm or in every neighborhood by means of a few inexpensive implements and simple processes, must, once for all, be abandoned.

THE REGULAR CONTEST PLOT.

THE trenches of the R. N.-Y. Potato Contest Plot (the *regular* one, not the Women's), were dug last week, the weather being very favorable, the soil dry. It is this year just one-fortieth of an acre. Not to be partial, several kinds besides the R. N.-Y. seedlings, were used for seed, April 8th. The first trench is R. N.-Y. No. 2. The second trench is R N.-Y. No. 3. This is the variety nearly destroyed last year by the flea beetle. The third, fourth, fifth and sixth trenches are the R. N.-Y. No. 4. The seventh trench is Brownell's Winner. The eighth trench is Monroe Co. Prize. The ninth is in part a variety sent to us by J. H. Woodburn, of Sterling, Ill., and New Queen. The 10th. trench is in part a seedling of Early Rose sent to us by Thomas Lazell, of Big Rapids, Mich., and Tonhosks, (we are not sure as to the spelling of the name,) from Theron E. Platt, of Newtown, Conn. The 11th, and last trench is Brownell's Winner. The R. N.-Y. has great faith in this new potato, and would have given more than the two trenches to it, had the seed been sufficient. Thus we have 11 trenches, 33 feet long, three feet apart—the pieces in the trenches being one foot apart—making an area of 1,089 square feet, or one-fortieth of an acre.

A FAIR ARMY.

THE names of the women who are enlisted for the potato contest will be found on other pages of this issue. The R. N.-Y. counts 804 of them, and the names are still coming. This contest is unique. Nothing like it has ever been started before. Think of nearly 1,000 wives and daughters of farmers striving for supremacy in a line that has heretofore been supposed to belong exclusively to men. The world moves. Thirty years ago such a thing as this potato contest would have been laughed out of sight. Now it proves the most interesting and popular movement of American agriculture. There is nothing unwomanly or undignified about it. Those who have entered for this contest are bright, energetic, independent business women, and the R. N.-Y. honors them for their energy and independence. All classes and all ages are represented. In short, we can only repeat that we believe that this contest is the most unique, the most interesting and the most helpful agricultural contest ever devised. The R. N.-Y. hopes that each contestant will be able to win a prize. At any rate, it is convinced that all who carry out the work will reap an increased measure of good health, good appetite and happiness. Success to the fair army of potato growers!

A WOMAN AT WORK.

THE other day we noticed a young married woman busily engaged in cutting and planting seed potatoes. She was one of the contestants in the Women's Potato Contest and would never have thought of doing such work had she not entered the lists for one of the prizes. The March wind disarranged her back hair and brought the tan to her cheeks, but it also gave her buoyant spirits and a voracious appetite for the supper she soon afterward prepared. "Why" she said, "isn't this fun? It's ever so much better than lawn tennis or croquet; for I feel as if I were doing some good; earning some money. Besides, I know now how much land the fortieth of an acre is; how far 33 feet is, and how to plant potatoes."

A beneficent result of the contest will be a bit of practical knowledge of farming, which the contestants are pretty sure to learn. Notwithstanding the "fun" at the outset, they will learn that it is tedious and arduous work to raise a crop of potatoes, and they will be the better enabled to appreciate the work of their fathers and brothers. On the other hand, the men will learn that women can do some things as well as others; that they can actually plan and superintend, or do farm work successfully, and they will respect them all the more for it. Their admiration and respect will be all the greater if the ladies raise more proportionally on their plot than the men do on the farm.

DAKOTA AND WHEAT.

IT will be remembered that during the early agitation for Statehood among the citizens of Dakota, various names were proposed for the northern section of the Territory. It was proposed to call the southern section Dakota instead of South Dakota, while in the place of "North" Dakota, Pembina, Lincoln, Garfield, and other names were proposed. The citizens of the Territory seem to have been in favor of Dakota; why, has not been satisfactorily explained. A subscriber suggests a theory that we have seen advanced several times before. He says that business reasons prompt the Dakota people to cling to their name. Dakota wheat has won for itself a wonderful reputation in the markets of the world. It is the staple crop of the country, and neither section of Dakota is willing to drop the name that represents so much in the milling world. And while on this subject, it may not be amiss to call attention to some facts developed in the investigations of the Canadian Experiment Station. Almost the only unoccupied public lands that can be considered of superior quality, now lie in the Northwest. The fertility of some of these lands is absolutely astounding—almost beyond comprehension. The northern countries—those generally with the poorest transportation facilities and the most unfavorable agricultural conditions—are the only countries producing wheat of the very highest quality—wheat that proves itself a necessity in the production of first-class flour. With an early-ripening wheat the northern countries are sure to be provided with a staple and profitable crop.

COLLAPSE OF THE NEW GREAT MEAT SYNDICATE.

ARMOUR & CO., of Chicago and Kansas City, have strangled the competition threatened to their dressed meat monopoly by the recently organized great American Meat Company. All arrangements having been satisfactorily completed, including the purchase of about 2,000,000 acres of grazing land and 250,000 cattle, together with a large slaughter-house at Kansas City and 12 established meat markets in Baltimore, and after $7,000,000 of the capitalization of $15,000,000 had been subscribed, early this week books were opened by a banking house in this city for subscriptions for $4,000,000 more of stock offered for public investment in order to extend the business. The subscriptions poured in in a volume much greater than the promoters expected, one party alone subscribing $500,000, and the prospects of a keen competition with the Armours became very lively. President Flager and Treasurer Moss of the Cotton-seed Trust, were respectively President and Vice-President of the American Meat Company. Armour is by far the largest customer of the Trust, as he needs nearly half of its product to adulterate his lard. So strong was the pressure he brought to bear on the Cotton-seed Trust that, last Thursday, Flager and Moss resigned and the subscription books were closed. All further subscriptions were declined, and those already paid are to be returned in full. Doubtless it will cost a great deal of money to settle with the original speculating investors; but what of that? The public must pay it, inasmuch as Armour will be in a position to wring it from the people by extortion.

BREVITIES.

PRICKLY Comfrey is now (April 11) three inches high.

STRAWBERRIES are becoming cheap and plentiful in this market.

THE R. N.-Y.'s Women's Contest plot was prepared and ready for the seed on April 9th.

PYRUS Malus Parkmannii has passed through the winter without the slightest injury.

THE experiments with milch cows, noted on page 272, ought to open the eyes of some dairymen.

REMEMBER that maple trees are, in one sense, like cows. The sap from one may make more sugar than that from another.

IT is a somewhat unfortunate thing that the season for "working the roads" comes just at the time when farmers should be doing their spring work.

THE R. N.-Y. believes that the day is coming when the dairyman who does not make use of the silo will be forced to take second place in the race.

THE new potato to be called King of Oneida, is evidently a long keeper. It is of good shape and all that appears against it is the color, which is purple.

"A STRAWBERRY of soil," is the latest name for a plant that requires a certain soil for its best development, while without such a soil it gives very poor results. Do you know of any such?

A STUPENDOUS and altogether creditable success is the Women's National Potato Contest. It is a success entirely beyond the best hopes of the R. N.-Y. Ladies, permit us to congratulate you.

STREET fakirs are selling "choice garden and flower seeds" for one cent per packet, or six packets for five cents. These packets have the imprint of a seed firm that went out of business last year.

WHICH is the quicker grown, the wheat plant or the corn plant? Which therefore requires the more soluble plant food and, at which stage of its life should the food be applied? This is worth thinking over.

ENGLISH farmers experimented with sorghum last year, in the hope of proving that it would make a valuable addition to their list of forage plants. The reports are almost all against it. England is not a corn country.

CATALOGUES should state more specifically than they do how high pea vines grow—that is, in a moderately rich soil. They should also state more accurately than they do the time required for the varieties of potatoes offered to mature.

THE planting of ailanthus trees for street adornment has been strongly advocated and as strongly reprobated. The Health Officer of Washington insists that for sanitary reasons the 500 ailanthus trees that beautify the capital's streets must go.

TAKE two workmen, give them plows of the same make and teams of equal strength. Can one prepare the land in better shape for the crop than the other can? Yes, sir. And it is possible for one team of horses to excel another at plowing by 50 per cent.

WE all feel frisky in the spring. It is the season for friskiness. We won't feel half so frisky in July and August. We won't, but the weeds *will*. The moral of all this is that we can easily lay out in April about three times as much as we can do in August. Another point is that what we neglect in August entails a double loss

ENGLISH farmers are just now discussing the Rye-grass question with great energy. A number of scientists and also some of the best practical farmers are advocating the use of this grass in the strongest terms. We also learn that various parties are again attempting to work up a "boom" for Prickly comfrey. Ireland is the only country where this plant has met with anything like a favorable reception.

AN anti-oleo bill now before the Ohio Legislature is likely to be defeated in the Senate. As was recently the case in Massachusetts, the adverse action of the Upper House will be due chiefly to remissness on the part of farmers in urging their views on their representatives, and treachery on the part of some of the latter in misrepresenting their constituents. Armour's lobby appears to be much more powerful before the Upper Houses of several States than before the Lower. Is it because the former being smaller in membership, the amount of the bribes can be made more persuasive?

Indust'l Societies.

THE TWENTY-SECOND SESSION OF THE AMERICAN POMOLOGICAL SOCIETY.

(R. N.-Y. SHORT-HAND REPORT.)

New fruits; the Idaho pear; the Lucretia dewberry; the Pine-apple strawberry; the Industry gooseberry; the Jewell, Berckmans and Progressive grapes.

As usual, the last session was full of business. First in order was the report of the Committee on Fruit Exhibits and the award of the Wilder medals, read by Dr. Hexamer, the Chairman. Several new fruits were noted by the committee. "The most noteworthy is the Idaho pear." After giving its origin and history, Dr. Hexamer said: "Its eating quality is far superior to that of others of its class. Season September to October. It has not been fruited outside of its native locality where the tree has withstood 30 degrees below zero." Specimens of an improved dwarf Juneberry from Nebraska were received. The flavor was described as approaching that of the huckleberry, and it was pronounced delicious by some. J. H. Hale stated that his firm has lately tested about 20 new strawberries. Among these the Pineapple strawberry was the most remarkable plant he ever saw; berries large, dark crimson and of excellent flavor. The Miami he thought would yield more large berries to the acre than any other variety. A note from Dr. Hoskins asked that the apples Yellow Transparent and Scott's Winter be added to the Society's list, also McIntosh Red, for which Vermont wanted two stars, also the same for Quebec.

An animated and hurried discussion of the later new fruits was then begun. Mr. Steele: "I have grown the Lucretia dewberry here in Florida with success, and it exceeds anything I have ever seen in size and quality, without exception. It is a success on moist land." Mr. Strong: "I think the Lucretia should be introduced in the Society's catalogue." Mr. Van Deman: "I second the motion and advise giving it one star in all States where it succeeds." Mr. Campbell: "It has been successfully trained up from the ground on stakes. The late A. J. Caywood has grown it thus with fine success." Mr. Marble: "I have seen it trained up thus on Mr. Caywood's place, and it was beautiful indeed, bearing very heavily." The Erie being asked about, Mr. Williams replied: "It is very nearly identical with Lawton." The gooseberry came next. Mr. Williams: "I have failed with the new Industry in New Jersey. Can't make it bear at all; tried a dozen plants. I like the Triumph, and consider it the best gooseberry we have in the State." Mr. Strobridge, "I have grown the Industry on clay soil; it doesn't mildew and I am pleased with it. It grows very large and fine. It is all I can ask." Grapes were next in alphabetical order. The "Lutie" was unqualifiedly condemned.

The Jewell grape was called. Mr. Campbell, "I have fruited it three years. It is a small, black grape of good quality; has been recommended by some as equal to Delaware; it is not so to my taste. It is more pulpy, but it is without its high character; its thicker foliage stands better against disease. Small size is almost its only fault; berries rather larger than Delaware, clusters no larger, slow, medium growth; habit like that of the of Early Victor; flavor as good as that of the Eumelan though different in character." Mr. Newman asked about the Berckmans. He said, "I fruited it last year for the first. It is generally pronounced equal to Delaware in flavor; its growth is more vigorous." Dr. Hape: "I have fruited it a number of years; it is more vigorous than the Delaware, and its quality is quite as good, which is saying much in favor of it. Berry larger than Delaware; bunch not so compact, quality most excellent, vine healthy." Dr. Hexamer: "I have seen the Berckmans on Mr. Carman's grounds, in New Jersey. I think the flavor is equal to that of the Delaware; it has more loose, open bunches; the vine seemed vigorous and I was surprised to see it doing so well in New Jersey." Mr. Strong: "I find it very healthy in Massachusetts." The Progress grape was asked about. Mr. Berckmans: "I have seen it and it looked very promising indeed; specimens very fine, very large, and very good. What it is, however, I cannot say." It was then moved and carried, to add the Berckmans grape to the Society list. The Green Mountain came up next. Mr. Manning: "I have seen it bearing in Connecticut; it's a very sweet grape, ripe August 25, last season, strong grower, very good grape, resembles foreign sorts in foliage." This ended the grape discussion.

Everywhere.

RURAL SPECIAL REPORTS.

Illinois.

SHELBYVILLE, Shelby County, April 1.—We have had a very mild, open winter, with but little snow or rain. Creeks and rivers have been running open all winter. Feed of all kinds is plenty. Hay is worth from six dollars to eight dollars per ton; corn, 25 cents per bushel; oats 20 cents; potatoes very plentiful—no sale, nominally, 40 cents per bushel. Farmers have generally finished sowing oats, of which a large acreage was sown. Early potatoes are mostly planted. The ground is now very dry for the season—too dry for grass to grow much. We have a fine prospect for wheat throughout this part of the State. Beef cattle are plentiful and lower in price than for many years; good butcher's stock is selling as low as 2½ cents per pound; good shipping hogs bring from four to 4¼ cents per pound. Apples are plentiful and selling for 40 cents per bushel in market. Grass and clover have come through the winter looking fine and there will be a good stand from last year's sowing. We sow grass seed mostly in the fall, say, in the last of August or first of September, and generally get a good stand if we have rain enough in the fall. We sow clover early in March on wheat ground, or later if sown on oats. Eggs are very abundant and are selling to grocers or shippers for seven cents per dozen. A large number of cattle were dehorned in this section last fall, and all parties, as far as I can see or hear, are well pleased with the plan. Most of the work was done in November and the first week in December, and I have not heard of a single death or of any bad effects resulting from the operation, and I know from personal experience that cattle are more docile and quiet in the herd after they have been dehorned. I think the best time at which to do it is late in the fall after the animals are one year old. E. J. M.

INDIANOLA, Vermilion County.—This western country is populated mostly by Southern people; hence, Southern modes and manners prevail more than those from the East. We have several 3,000-acre farmers who can't read or write. Before their children grew up to use the pen, the shrewd but ignorant native hired a lawyer by the year to do all business for him. Many farmers of *wealth* here regard a farm journal as a luxury which they can't afford. As I have made the circuit several times in all the Western States, I know the people. One will find in Michigan colonies of N. Y. State people; Racine, Wisconsin, is made up of people from the same State. In other sections of all the Western States one finds colonies from N. J., Pennsylvania and other Eastern States. But the war drove a great many bankrupt Southerners to this place. O. K. L.

New Jersey.

FREDON, Sussex County.—The farmers in the neighborhood are out on a strike with the proprietor of the creamery. Last year prices at the creamery were half a cent off from N. Y. prices for eight months and full prices for four months. These terms the farmers are willing to take this year; but the creamery man refuses to comply and the prices he furnishes are as follows: half a cent off for eight months and a quarter of a cent off for the remaining four months. These the farmers refused to accept and they drew up a bond which was signed by all the milk-producers except one, to the effect that anybody must forfeit $50 who brought milk to the creamery.

W. R. N.

New York.

UNION SPRINGS, Cayuga County, March 25.—Crops were very good in this county last year. This is a grain-growing section. Wheat averaged about 20 bushels; barley, 40 bushels; corn, 100 bushels, and hay two tons per acre. Wheat sold at from $1.20 down to $1.00; barley 65 to 80 cents; corn 45 cents; and hay $12. per ton. March has been very mild, some farmers are plowing. Oats will be sown this week.

O. L. C.

Ohio.

BELLEFONTAINE, Logan County, April 1.—March has been an unusually warm and dry month. There was a fall of snow of about an inch, on the 29th. This morning the mercury is about 30, and the weather misty and disagreeable. Wheat is in fair condition, though it is heaved out in some places, with much clover in the same condition. I think the fruit is uninjured so far. ***

Vermont.

BENSON, Rutland County.—We are having a fine sugar season—the best for a long time. Maple sirup is selling at about 80 cents per gallon. I noted, however, that one of our sirup makers is getting more orders than he can fill at $1.00 per gallon, and the reason for this is that he will put up no sirup which weighs less than 11 pounds to the gallon; while the 80-cent sirup weighs only nine to 9½ pounds and is liable to work and sour. Parties who have once used this 11-pound sirup refuse the lightweight kind at any price. Our neighbor had orders for all he could make long before the season opened. Will it not pay every farmer to try to excel in the quality of some one product, thereby getting a reputation which will give him a ready market and good prices at all times? My Shropshire ewes, some imported and the rest from imported stock, are dropping some very fine lambs this spring. A two-year-old ewe, dam bred by Sir Henry Allsopp sire bred by John Evans, England, dropped a ewe lamb (her first) which weighed, as soon as dry, 13¾ pounds. I have placed at the head of my flock the ram "Hercules," sire and dam imported, bred by one of Canada's best flock-masters, a prize-winner in Canada, the closest-wooled coarse-wool sheep I ever saw; but he clipped last year 18½ pounds. Weighs in show shape 250 pounds, and is a model. H. F. S.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

IN addition to preparations for housecleaning, the early spring gives the opportunity of planning the summer sewing. Before anything new is bought, the old things must be looked over. Such as are in good order should be put aside, while those that need making over are to be ripped apart, washed or sponged and pressed. By these means one can tell fully what is needed. If the family purse will not permit of anything new (and that is the case with many of us) we must simply make up the old things to the best advantage. If a woman of small means will remember always to buy things that go well together, she need never look "made over." Black is usually the best foundation for such a wardrobe, because people don't remember it; outside garments and best gowns should be of this tint. Hats and little trimmings might show any becoming tint. Green is now a very fashionable color to combine with black. An occasional garment of dark blue might be chosen, because that color goes well with black; the same is true of gray.

A woman having two old gowns which she wishes to make into one new one, could make a stylish redingote costume, if the colors would go together. The skirt should be of the lighter material or it might be striped or figured. Back and front breadths should be shirred over a foundation; in the back there should be one moderate reed and a pad at the top. The redingote should have on either side a large tab or panel, covering the side breadths to the bottom; in the back it is short, like an ordinary basque. In front it is cut off square to the waist line; it has a full vest, with a little sash across the bottom, and a loose outer jacket—short also, turned back to make flaring revers. The outside of the sleeve is very full, this is basted on a foundation. It forms a puff at the shoulder; below this the fullness is laid in straight plaits, catstitched down with floss of the same color, to about two inches above the elbow, where it forms another puff. Below the elbow is a deep, straight cuff. This is an extremely pretty sleeve suitable for any soft stuff. A pretty seersucker or gingham dress, in which the sleeves are worn or too tight from washing, may be wonderfully freshened by putting in white muslin sleeves made after this model, and a shirred or plaited white vest or guimpe. The style is worn either by children or young ladies.

NEW ENGLAND OUTINGS.

IV.

MARY WAGER-FISHER.

IT is a very pleasant ride by horse car from Cambridge to "sweet Mount Auburn," and if one wishes a guide for the cemetery he can find one at a trifling cost in a small book filled with explicit directions. But I did not care for one, and with the laddie, whose sole bent was to see the boulder brought from the glacier of the Aar for Agassiz's monument and Longfellow's tomb—because Longfellow wrote his beloved "Hiawatha"—I sauntered through the grounds, content with what we found, enough for one short half-day in that extremely beautiful place.

The boulder that marks the grave of Agassiz was nearly covered with ampelopsis growing over it and half concealing the name it bore, no record of the scientist's work being cut in its hard surface. Some pines growing near it had been sent from his birth-place in Switzerland. Over Longfellow's grave, grass was thickly growing and two elms shaded it with their branches. It was marked by a granite

ALL competent authorities say Bright's Disease has no symptoms of its own, but presents the symptoms of other affections. Warner's Safe Cure is universally recognized as a specific for Bright's Disease. That is why it cures so many other diseases, which are caused by the kidney affections. It restores the kidneys to healthy action.

tomb. Flowers grew outside of the coping. Above Charles Sumner's grave grew an oak. His parents lie buried near him, his mother's name being Relief Jacobs Sumner. The monument to Margaret Fuller has a long epitaph. Only the body of her child lies here, as neither hers nor her husband's body was recovered from the sea in which they were drowned near Fire Island, off New York. The child's grave was covered thick with Lilies of the Valley. Charlotte Cushman, in accordance with her wish, was buried in a spot overlooking Boston. A tall marble obelisk marks her grave covered with a mat of periwinkle. Nathaniel P. Willis, who wrote prettily in his day, lies in a plot filled with members of his family of whom "Fanny Fern" was his sister. The monument to Edward Everett is the only one among these graves of noted men that I remember as even so much as hinting at their services. On his are recorded a list of the important offices he filled. An interesting monument is that to the memory of Harndon, the founder of the express business in America. A text on the stone is an illustration that something applicable to everything may be found in the Bible. "The king's business required haste," which with the aid of a concordance can be readily found.

Before leaving the grave of Longfellow I am tempted to refer to the death of the mother of his children, as latterly an article has been going the rounds of the newspapers concerning it, which differs very materially from the account given me by a connection of the Longfellow family, who was with them all the morning of that fatal day. It was at the outbreak of the Secession War, and Mr. Motley, the historian, who was just home from Europe, spent the morning there and discussed the state of the nation—the all-absorbing topic. "It was an exceedingly warm day," said my informant, "and Mrs. Longfellow was very lightly clad in a white gown. I remember the dress perfectly, and how pretty she looked in it. It was flounced to the waist and had flowing or loose sleeves. She was tall and slender and had a very stately and dignified manner. It was little Edith's birthday, and her mother cut off a quantity of her golden hair, which, after dinner, she put in envelopes to send around to the child's playmates. Mr. Longfellow sat half dozing in his chair in his study adjoining the room where she was arranging the letters. She used wax to seal them, and while melting it in the flame of a candle, the sleeve of her gown caught fire, and from the lightness and dryness of the fabric she was instantly in flames. At her cry Mr. Longfellow sprang to her side, wrapping his coat and a rug around her, but in her agony she broke away, and so terribly was she burned that she died on the following day. The poet was never the same man afterwards, and never after shaved his beard."

That a prophet hath not honor in his own country was exemplified in Cambridge, by Anaximander asking where Mr. Higginson lived. The laddie greatly liked his History of the United States, and in many ways we knew him as a charming writer, but no one whom we asked knew him. One said, "Is he a storekeeper?" Another, "Does he keep a saloon?" A year or two later we met the object of our inquiry, and telling him of our non-success in finding where he lived in Cambridge, he said laughingly "If you had asked for Colonel Higginson, every one would have known," so much do titles become a part of one's name.

When Sunday came we went to hear Phillips Brooks preach in his magnificent church, which forms one of a group of superb buildings, including the Museum of the Fine Arts with its striking facade, which form in a way, the initial letter, of the most aristocratic quarter of Boston, called the "Back Bay." The entire superstructure of earth in this neighborhood of monied nabobs, has been artificially produced by "filling in" the Back Bay. Money can accomplish a very great deal, but the old part of Boston, with its narrow, winding streets, is to my soul the ideal of municipal attractiveness, and of course it is not necessary to remark that the really great and famous ones of Boston do not live in the Back Bay.

The Church of the Trinity, in which Mr. Brooks preaches, is as ornate inside as it could possibly be. If there was a square foot in it left undecorated I failed to see it. Mr. Brooks preaches under a big sounding-board, but his speech rushes out of his mouth in a torrent, so that it is no easy task to understand and follow him. He is a very large man and in his black gown makes a striking figure in his pulpit. He is a Low Church Episcopalian and has strong and decided opinions about things to which he gives a vigorous expression, and for these reasons he exercises a very considerable influence even outside of his church. The Spiritual Temple is not far from Trinity and is a striking and beautiful exterior, and we were sorry that it was closed, as we had heard much of its interior finish. It is by far the finest temple or church owned by spiritualists in the United States, not because spiritualists abound more particularly in Boston, but because one of them who was wealthy chose to build this temple in honor of his belief, which ought to be a very comforting one in this materialistic and doubting age.

As we were not likely to indulge in much loafing with the attractions of Boston all around, we decided to go to Plymouth for a month and enjoy sight-seeing at our leisure. We went by rail *via* the South Shore R. R. Passing through Quincy, a gentleman pointed out to us the low, slanting-roofed, red brick house in which John Adams lived and in which John Quincy Adams was born. And then on we went through the beautiful village of Hingham, which, like all the towns, looked very attractive. The houses were mostly of wood, often covered all over with shingles, the foundations generally of brick. The stone walls were lichen-grown, apple and pear trees were laden with fruit, and the great elms were girdled with tar. There is a certain candor in the blue-eyed, fair-haired New England girls, that is very winsome, and every one, rude or cultivated, speaks with the broad "a" which, of course, is the correct pronunciation, and as much as I have heard all classes of people talk in New England, I have never yet heard one give "a" the sound the many do who pronounce psalm, "sam."

GOSSIP AND GOSSIP.

GOSSIP is worthy of all reprobation; certainly every man has his fling at it, and we of the talking sex are oft chidden for our indulgence in this pursuit. But all the same, whatever should we do without it? Of course, we ought not to say anything either untrue or ill-natured, but there is no doubt that the brightest conversation we hear is gossip, pure and simple. That is to say, it is about people—a healthy-minded man or woman always finds humanity more entertaining than any abstract subject. But such gossip need not be about our neighbors. There is no doubt that a nimble tongue, both truthful and good-tempered, will win more friends than genius or beauty. The most popular woman we know, often holds that position merely because she knows how to use her tongue, and also how to govern it. So there is the chance that we may all be equally charming.

The first qualification if one would have one's conversation appreciated, is to suit the listeners. One would not talk ribbons to a man, or guns and boats to a woman. Another thing neglected by many bright talkers, is to give the listeners a chance. Always remember that others have something to say, probably something worth saying, too. And while one may say a little about friends and their ways, it is a good deal better to let personal gossip chiefly consist of chat about prominent people, who seem to be more public property. For this reason, a woman who reads the newspapers always makes the brightest talker. Wit comes by nature, but a witty turn of speech may be cultivated, always remembering that wit which wounds or ridicules others shows lack of that true good breeding and courtesy which is simply the golden rule in every-day use. A great many women are deficient in natural sense of humor, but it is certainly to be cultivated.

How can any ordinary girl become an agreeable talker? By the cultivation of sympathy and kindliness towards all, coupled with thorough truthfulness; add to this constant miscellaneous reading, books, newspapers, and magazines, and a little practice—an attempt to be pleased with others, and to please, and your charming talker is made.

COTTAGE MAID.

GOLDEN GRAINS.

BOSSUET asserts that the spirit of the world includes four kinds of spirits diametrically opposed to charity—the spirit of resentment, the spirit of aversion, the spirit of jealousy, and the spirit of indifference.....

GOOD nature is the very air of a good mind, the sign of a large and generous soul, and the peculiar soil in which virtue prospers.....

MAN'S character is an element of his wealth, and you cannot make him rich in what he has except as you teach him to be rich in what he is.....

WHEN obstacles and trials seem
Like prison walls to be,
I do the little I can do,
And leave the rest to Thee.
—*Faber.*

DRYDEN SAID: "Let grace and goodness be the principal lodestone of thy affections. For love which hath ends will have an end, where as that which is founded on true virtue will always continue."

"I NEVER complained of my condition," said the Persian poet Sadi, "but once, when my feet were bare, and I had no money to buy shoes; but I met a man without any feet, and became contented with my lot."

A LIFE of duty is the only cheerful life, for all joys spring from affection, and it is the great law of nature that without good deeds all good affection dies, and the heart becomes utterly desolate. The external world then loses all its beauty; poetry fades away from the earth; for what is poetry but the reflection of all that is pure and sweet, all high and holy thoughts?.....

THE SHOE AND LEATHER REPORTER says that bad luck is simply a man with his hands in his pockets and a pipe in his mouth, looking on to see how it is coming out. Good luck is a man of pluck, with his sleeves rolled up, and working to make it come out all right.....

BY the words of our mouth we may affect to adore religion, but it is by the work of our lives that we adorn religion.....

THE BOSTON RECORD tells of a four-year-old boy who had been in the habit of repeating a formulated prayer every evening and surprised his parents the other night by saying: "Oh, God, I wish you would make the trees walk." When remonstrated with for his singular request, he replied: "You say that God can do anything, and I want to see the trees walk, and I shan't pray for anything else until they do.".....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

NOW is the time to simplify the housework; to go without the toothsome dainties that consume so many hours in their preparation, and to do less sewing by wearing plainer-made clothing. The time you have so gained spend out-of-doors, on your potato plot if you like, but out-of-doors in the blessed sun and air and away from the kitchen. If you do not care to work in the soil, study, read, mend or rest in some shady spot, but do you spend a portion of each day out-of-doors! Your nerves will be stronger, your health will be better and you will be happier for it and so ought the members of your family.

A TALK ABOUT SEWING.

"IN ye olden times" a girl was looked upon as being very ignorant if she did not know how to hem, fell, darn, cat-stitch, knit or crochet. The sewing machine has done away with "hand work" to a great extent, but still there are some things which must be done with hand.

The foreigners keep to the practice of teaching the children these things far more than do our own people. I remember seeing little German girls going to and from school with their knitting—working as they went. Some of them were tiny tots not more than six or seven years of age. They looked like some quaint old pictures come to life—with their little red or buff dresses, made very short and plain in the waist; with the skirts full and long, nearly touching their shoe tops; the hair combed backed smoothly from the face, plaited in two tight pig-tails behind, either hanging down or coiled around and pinned.

In days of yore each girl began, as soon as she learned how to sew, to make things "'gainst the weddin' time." If she could not bring a well-filled "chest" or "box" as her dowery, it was considered a disgrace.

It is well for our girls to learn to sew, but when I think of the hours those poor little girls of the past spent stooping over their sewing or "sampler" and missing thereby the delight and joy of God's air and sunshine, I heave a sigh for the poor little things. But there is *mezzo termine*, or in other words, a middle course or a happy medium. Every girl should learn to handle the needle to such an extent as to be able to keep her own clothes in order. It may be necessary for foreigners to drill their little girls into the art, but not so with the average American girl. If she is bright at all, she has Yankee ingenuity enough to do almost anything if necessary.

I remember when we were young what pains my mother took to instruct her children as she had been taught herself. How my eldest sister could sew! When she was twelve years old she stitched the bosom of every shirt my father wore. She braided and embroidered the babies' clothes, she crocheted lace for their underclothes; in fact, she did almost everything that a girl could do in that line. Next to her came a boy, then your humble servant who was always "a thorn in the flesh." I had one accomplishment in the way of needle-work, and one only. *I could darn*, and that's all. I rather liked to see a piece of cloth, as it were, grow 'neath my fingers. Then again, I could use a coarse needle, and didn't have to wear a thimble. Besides, my brother had to have some one to play with, so I gradually relinquished my place to the younger girls, who also learned to ply the needle with deftness They always were such "pinks of propriety," never were up to the mischief that I got into, never came home with their ruffles tied in "lover's knots" around their heels, never had the gathers out from the waist. But poor little *me!* I was always in some such plight. At last mamma decided that each of us must mend her own clothes or wear them as they were. I couldn't sew! But I could darn. So I used to darn the girls' stockings if they would mend my frocks. But this arrangement did not last long, for they soon found that they had the worst of the bargain. Then what was I to do? I finally bribed them.

"Say, if you'll mend my blue dress I'll give you my new hair ribbon—Will you?" or "If you'll mend the lace on my petticoat I'll give you my 'Uncle Tom's Cabin'" and in this way I was kept from tumbling apart. But after awhile I had bargained away everything I had worth giving except my "Life of George Washington." One day I said, "Gertie will you mend my dress?" "What'll you give me?" she answered. But all I'd offer wouldn't tempt her—she would answer:

"Give me 'George Washington?'" No, I couldn't do that, so I'd go to another sister. Same result.

Then I tried to do my own sewing. I managed fairly well (only my back ached and I ran the needle under my nails till my fingers were sore), for a little while, but I finally determined that "George" wasn't so precious after all and struck up a bargain with one of my sisters. She was to have the book which had belonged to my father and was a very handsome one, if she would mend my clothes for a month. She agreed, and kept her agreement and so did I.

But as I merged into womanhood I found that I must learn to sew, so set about it. As I have said, American girls have Yankee ingenuity enough to do almost anything they undertake, if they are earnest and determined. So I learned to do my own sewing and have made all my own clothes, dresses included, for years. Not only that, but my sisters always want my advice and opinion in regard to their new gowns, and "If I do say it myself as hadn't orter" I can sew just as well as any of them.

But I didn't want to talk so much about myself, only I wanted to show that it is all nonsense making little girls sit still and sew for hours, while they ought to be out in the fresh air; ought to be enjoying a good romp and frolic. No wonder boys, as a rule, are stronger than girls. They play ball, cricket, leap-frog and kick-the-wicket to their heart's content. They use their muscles, they expand their lungs, they become strong and robust, while their sisters sit on their little stools, perhaps in a close room without any ventilation, and stitch, stitch, stitch. Their backs may ache, their eyes may be weary, but they must do their "stint." Then when that is over they may take a walk, "like a lady." No wonder the poor little things are pale and delicate! No wonder they make sickly frail women! Are they fit to be the mothers of our coming generations? No wonder there are so many miserable creatures dragging wretched, ailing bodies about! If you want healthy, hearty, men and women in the future, give your girls proper care. Teach them to frolic and play out-door games as well as the boys. This practice, I am glad to say, has, within a comparatively few years, become more fashionable than it used to be. When a girl has "gotten her growth," as the old-fashioned people say, it is time enough for her to learn to do fancy-work. Of course, I think, as I said, that they ought to be taught plain sewing enough to enable them to keep themselves neat and tidy—but what's the use in teaching them to fell and hem, embroider, crochet, etc., and neglect their health thereby? A good plan would be to let the girls have one afternoon a week in which to sew; they could be taught all that is necessary in that time, and then when indulged in only

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

as a pleasure, they would be more anxious than ever to learn.

I have heard people tell of how, when they were young, they would be given a piece of work to do, and when it was finished would be told that it was all wrong, that the stitches were "dreadful," and then, after receiving a good slapping for their "slatternly ways" were told to rip it all out and do it all over again. Instead of being encouraged and helped, they were set at the task like a galley slave. Now these same old-fashioned people shake their heads when they see some of the girls of to-day playing lawn tennis and other such games. But although the liberal tendency of many mothers in this direction is increasing, we want still more of it.

There never was a race known where the men and women attained a higher physical and mental culture than they did in Greece. The women, many of them, were as learned as the men. Take Hypatia for instance. They attained such mental hights because of their almost perfect physical bodies. They raced and had their games, the men and women together. They represent the age of the greatest beauty, refinement and poetry, and yet the women stepped into the *arena* and raced with the men. One reason of the high culture they attained, was, as I said, on account of their physical condition. Who can learn, and enjoy what he is learning, who can do his *best*, while suffering physical pain? We have instances where great poets or writers were sick and miserable, but think what they would have been had they had health and strength?

Mothers, think over what I have said, even if I've done it in a bungling fashion. See that your little girls get a chance to develop their bodies as well as their minds. Let them have plenty of exercise, and all of God's fresh air and sunshine that you can give them.

DORA HARVEY VROOMAN.

THE prettiest hats for young girls, that we have seen are broad-brimmed and low-crowned. For every-day wear these are trimmed with light weight surah silk, quite broad, and held in place around the crown with small fancy pins. Those for best wear are trimmed with wreaths of flowers to the exclusion of silk or ribbon.

SOUND.

READING the various directions and suggestions as to preparing meals and housekeeping generally in these days of much writing and much cooking, is almost discouraging. It may be all very well when there is plenty of household help or in small families, even with less help, to make a point of having dinners with courses—even the three which so long ago the Autocrat assured us were as good as ten! But how can any house-mother, with even one baby to care for, find time for one course carefully prepared and daintily served with the spotless napery and shining glass and silver so strenuously insisted upon as making the plainest fare appetizing! By the time the breakfast things are done and the baby settled for his morning nap—if indeed he is a well regulated one who has naps—there may be two hours left before the noon meal. Meanwhile the dining-room must be brushed a little and dusted; the front entry and steps swept, the beds made and things picked up and put in order in the sleeping-rooms, besides half a dozen or more other things for which one may as well allow, as they are sure to come as interruptions of any regular program. And this is supposed to be an off day when neither washing, ironing nor baking is to be done.

Probably at least half the housekeepers who read the RURAL do all their work, except as older girls, and *boys*, too, if well trained, are helpers. And how *can* all these extra nice touches so often described, be given? Indeed who can wonder that a feather duster is whisked over the furniture instead of the cloth so carefully used and shaken out of window or door? Yet even with all the effort possible to save work, the time left to get the dinner is quite too short for more than the plainest meal with one course. And, after all, who is the worse off for the plainer fare? Good bread and meat with one vegetable are certainly enough so far as health is concerned, and it is always admitted that keener relish goes with the smaller variety.

To be sure, it isn't very much to put together a simple pudding or even the much abused pie, but it is well to remember that neither is essential. And if it should occur that there was only time to prepare beefsteak and potatoes, with neither soup, nor pastry at either end of the meal, a plate of crackers and cheese with a dish of apples will answer very well and save the tired mother's strength for better work than making dainties. Then the saving in dish-washing from the smaller variety is an item larger than would be supposed. Counting the dishes after an ordinary three-course dinner, for four people there were 75 articles to handle. Here is where our grandmothers, so often held up to us as models of good housekeeping, had the advantage of us. Would they not want to go back to the old days of spinning and weaving after a trial in the homes of some of their descendants? Yet let us not go back one step! Only drop unnecessary work rather than spend lives in a vain endeavor to make one pair of hands do the work of two or more. Plain living and high thinking is still a good motto. Simple meals, slowly eaten, accompanied with the sauce of cheerful conversation, are not likely to produce evil results.

A. R. D.

HARPER'S BAZAR says that the salutation which meets one in the morning is the key-note of the day. If a woman is met with "Good-morning, my dear! what a pretty gown you have on! you look as fresh as a peach blossom," she will go about her duties gayly. If she is met with a husky "What is all this noise?" "Whose bill is this?—How much too large it is?" "How wretchedly sallow you look!" she is appalled, cowed, discouraged; the day is ruined.

BRIMSTONE FUMIGATION FOR MOLD AND DRY-ROT IN CELLARS.

HAVE I opened a new field of investigation? The past summer was extremely wet and cold, my cellar very moldy and my strength not up to the mark of such whitewashing as would free it from all mildew spots. Sulphur fumigation seemed the one thing to try, so I emptied the cellar and sent to the nearest druggist for two pounds of brimstone. But, to my dismay, John dug the potatoes, poured them on the damp cellar floor in great heaps, five feet high, heap joining heap, before the brimstone got here, even forgetting that an early freeze had chilled a few of them in the hill. By the middle of November our potatoes were "going" pretty fast with wet and dry rot; it was the first time in 20 odd years that we had potatoes rotting in the cellar, except when they had been frozen. I had not doctored diphtheria all these years without learning that unless the cellar was at once made right the rooms above it would not be fit to live in.

True, it was so far better than the average cellar that it had a four-inch tin pipe running from a little above the floor into the kitchen stove-pipe above. Since it was put in, the place has been reasonably dry. Well, John promptly picked over those potatoes, spending several weeks at the job, and he is the quickest man at such work that I ever saw. Meantime, I pasted several thicknesses of paper on the floors above the cellar, nailed heavy building paste-board tightly over that, and then replaced the carpet. To fumigate, set an iron kettle "bottomed" with ashes on the floor, poured into it a shovelful of live coals and put nearly a quarter of a pound of brimstone on them Then I made haste to get out and close it up air-tight. Squashes, pumpkins and garden vegetables generally had to be left in the cellars during the fumigation, and I supposed the brimstone smoke would flavor them. They were spoiling fast any way, so it did not matter. We kept up the smoking for about two weeks, off and on, but did not keep the ventilating pipe closed all the time.

Then I remembered that both green and dried fruits were bleached by means of such fumes, and I cooked some potatoes. They were all right. The few squashes left sound at the time of smoking kept quite sound until eaten. The pumpkins and potatoes have not rotted any since. The family are unusually well. Of course, we *burned* all decayed and decaying tubers for fear of infecting the ground if we buried them,—I mean the few that escaped the picker. The bulk of bad ones were carted off to a sandy ravine and put out of reach of cattle. I will put some to sprout to-day, to see if fumigation has destroyed the germinating power. I hope it has.

E. S. LINCOLN.

STARCHING AND IRONING.

TOO LATE FOR THE SPECIAL.

MY husband has had three years' experience with the Chinese laundries and considers my work superior to theirs. My brother, who is very fastidious, also considers my laundring superior to that of the Chinese. I use Elastic Starch. Bogue's Chinese Laundry Starch is also very good. The following rules must be observed to insure success: Be sure your linen is clean; careless washing spoils good starching. Clean your flat-irons, sides and bottoms, with fine emery paper, wash well with soap-suds and put immediately over a good fire to dry. Have the articles dry. To every pint of luke-warm water add one and a-half table-spoonful of starch; mix thoroughly and add a little good bluing. Starch them the usual way, bosoms on both wrong and right sides, dipping and wringing five or six times to make them stiff; fold and iron after ten minutes. After the linen is ironed, moisten with a damp cloth, not too wet, then by rubbing the heel of a smooth flat-iron cross-wise of the article, it will produce a fine polish. Or you may use the point of the flat-iron by ironing one way with a heavy pressure. After the article is ironed, take the sharp edge of the iron and press it all along upon the stitching of the shirt and the same upon the collars and cuffs. After the cuffs are ironed, press a hot flat-iron over the wrong side a few times, quickly bend the ends together and pin or tie to hold them; and insert the others in the one so secured. Or put in a round box to retain the shape.

MRS. J. D. CLARK.

OUR young men do not like to be outshone by their city brothers and therefore send their linen to the city laundry—an unnecessary expense if mother or sister would learn the right way to "do up collars and shirts." To be successful in doing them up one must be sure the washing has been well done, then, before drying, starch in boiled starch. Pour boiling water on the starch that has been moistened with cold water, stirring it rapidly—it is quite unnecessary to place it on the range. Add a little bluing after the articles have become perfectly dry, (this last condition is very important) dip in thin cold starch, wring and roll in a dry cloth. They will be ready for the ironing process in a half hour. Be sure the irons as well as the ironing cloth are very clean. Iron the collars slightly on the wrong side; then turn and finish on the right side; do not use a very hot iron, but, instead, use all the strength you can exert, and they will shine. Do not call the collars finished until they are quite dry or at least seemingly so, and place them on a plate in the sun, or over the range for a short time. Iron the shirt-bands first, then sleeves and body, the front last, using a sheet folded the size of the shirt front. This is so much better than a board—try it. A young house wife can well be proud when she can accomplish this branch of home making well.

MRS. S. B. DOUGLASS.

IN doing up shirts and collars I starch in thoroughly cooked starch as soon as rinsed, I find that thin starch is as good as thick and put nothing in it to keep from sticking, as there will be no need if well cooked. Thoroughly dry, then dip in cold starch made of one tea-spoonful of powdered borax, one of starch dissolved in a little cold water, then pour in enough cold water to make a pint. Spread out collars and cuffs on clean cloth and roll up tight, iron in an hour. Have the irons very hot and bear heavily on the irons and I think the polish will satisfy the average man.

MRS. W. A. K.

CRANBERRY PIE.

TAKE cranberries (frosted ones will do), one and one-half cup and smash each one, add a large cup of sugar, half a cup of hot water and just the least sprinkle of nutmeg. Bake between two crusts.

AGRICULTURAL NEWS.

SATURDAY, April 13, 1889.

THE Department of Agriculture's report for April, a synopsis of which was telegraphed to this City last Wednesday, relates to the condition of winter grain and of farm animals as they go out of winter-quarters as follows. The seeding of wheat was somewhat delayed in the Middle States by early autumn rains, and east of the Ohio by dry weather in September and October. Later conditions were favorable in both sections, with mild and drier weather in the East and a fair supply of moisture in the West. In the South the condition of the soil for seeding was generally favorable, and germination was prompt and the growth good. In California the autumn rains were followed by a dry season in winter, but refreshing showers in March caused the germination of the grain lately sown, and a vigorous growth of the early seeded area. There was but little winter protection, except for a short time in mid-winter, in the latitude of heavy winter snows. Consequently the more northern breadths are somewhat brown in color, and patches in wet soils are winter-killed. Yet the temperature has been so mild, with so few sudden extremes, that the present condition is very good. The plants are generally well rooted and have been growing over a large part of the area through the winter. The general average condition is 94, nearly the same as the April condition of the crop of 1886, which fell at the harvest to 87.8. That of 1888 was 82 and that of the previous year 88.1. The April condition of the large crop of 1884 was 95.4, going up to 98 at the harvest. The present condition by principal states is: New York 94, Pennsylvania 93, Texas 97, Kentucky 97, Ohio 88, Michigan 87, Indiana 94, Illinois 97, Missouri 95, Kansas 96, California 98. The condition in the Southern States ranges from 90 to 97. The rye crop is also in good condition, better than that of wheat in Ohio and Michigan and worse in Missouri, with slight differences in other States. The general average is 93.9. The mild winter has been favorable to farm animals, which are generally in high condition. The general average for horses is 98.4, for cattle 96.9, sheep 97.4, swine 95.6. The estimated losses from disease and all other causes during the past year have also been much less than usual. That of horses is 1.5, cattle 2.4, sheep 3.8, and swine 6.2 per cent. in each case less than last year.....

.....April 26 will be Arbor Day in New York, and May 3, in Pennsylvania. April 10 was pretty widely celebrated by the school children of Maryland.....There's likely to be no end of trouble in Oklahoma after the opening of the country to settlement on April 22. There are only 10,000 quarter-sections altogether, and it seems likely that 100,000 people are ready to scramble or fight for them. The most reasonable estimate puts about five claimants on every quarter-section of every kind, and there are likely to be a dozen or a score on every eligible well timbered and watered quarter-section. All the bordering country is thronged with intending settlers. Some have fast horses to get ahead of others and one party has a balloon! The woods in the territory are full of concealed squatters ready to take up claims after midnight on the 22nd. Special trains are to be run in time from many points as far off even as Chicago. There are threats that the railroad bridges to the country will be burned to prevent travelers by rail from getting ahead of the others. Land officers have been established at King Fisher Station and Custine, but the Government doesn't know whether there is now a single building at the latter place, which is to be the capital of Western Oklahoma. There's likely to be a good deal of bloodshed among the reckless rough-and-ready element. ..The story about that Florida Orange Syndicate appears to have been bogus or else the project has collapsed.....The Salt Syndicate is negotiating with the salt operators at Hutchinson, Kansas, for the sale of their works. They want a six-months' option at prices to be agreed upon afterwards..... The committee appointed by the government of New South Wales to investigate M. Pasteur's discovery for the extermination of rabbits, reports that it finds that the rabbits that had been inoculated with the virus of chicken cholera, or which ate the food which had been infected with the virus, died, but the disease was not communicated from one rabbit to another, so that the offer of $125,000 for the discovery of an effective exterminator of the bunny pest in the Australian colonies is still open to the ingenious or the lucky..... There are now forty-six, or, including the branch stations, nearly sixty agricultural experiment stations in operation under the Hatch Bill, conducting scientific and practical experiments in regard to soil, tillage, manures, crops, stock-feeding, dairying and horticulture. They employ more than 370 scientists and agriculturists and will receive during the current year, $595,000, from the National Government and about $126,000 from the various States and other sources.....

Good News.

Here are two instances of the beneficent action of Compound Oxygen. The one in a severe case of consumption, the other in the weariness of general debility. Concerning the first we receive the following:

PORTAGE, Wis., Jan. 30, 1888.

"My wife has been taking your Compound Oxygen for over two years for consumption and has derived much benefit from its use; in fact, I think she would have died long ago but for it." H. D. JAMES.

In the matter of general debility we give the following extract:

BENTON HARBOR, Mich., Nov. 28, 1888.

"I am indebted to you beyond all other Compound Oxygen purchasers."

BENJAMIN J. EAMAN.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 120 Sutter Street, San Francisco, Cal.—*Adv.*

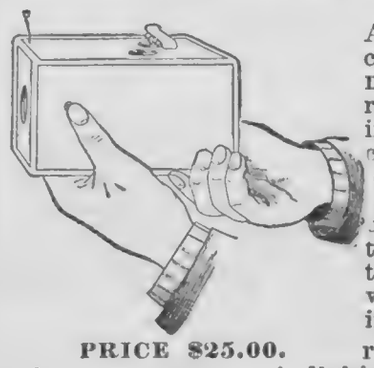
The Kodak.



PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be reloaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker

TUTTLE & Co., 78 Nassau Street, New York City

APOPLEXY, pneumonia, rheumatism are prevented and removed by Warner's Safe Cure. Why? Dr. Geo. Johnson of King's College, London, England, says: "There is wide-spread enlargement of the muscular walls of the small arteries in chronic Bright's Disease, not only in the arteries of the kidneys, but also in those of the pia-mater (investing membrane of the brain), the skin, the intestines and the muscles, as a result of a morbidly changed condition of the blood due to kidney disease." If the kidney disease is not cured, apoplexy, pneumonia or rheumatism will result. Warner's Safe Cure does cure kidney disease, thus enabling them to take out of the blood the morbid or unhealthy matters.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

NEW HAMPSHIRE LAW OF DESCENT OF A DECEASED INTESTATE'S ESTATE.

L. T. S, Rumney, N. H.—What is the law in this State regarding the distribution of real and personal property where the owner dies intestate, leaving a wife but no children? The property consists of two good, well-stocked farms with buildings, in different parts of the State, and considerable money in various investments.

ANS.—The New Hampshire law for the distribution of the estate of a deceased intestate provides that the judge of the Probate Court may make to the widow a reasonable allowance out of the personal estate for her present support. She is also to be endowed of so much of her husband's real estate as will produce a yearly income equal to one-third of the yearly income of the whole. She is entitled to so much of the homestead occupied by the family as shall not exceed $500. Where the deceased husband has left no children or issue of any, the widow is entitled to receive, in addition to this dower and homestead, one-half of the personal property left after the payment of debts. By releasing her rights of dower and homestead, she becomes entitled to receive, instead of these, one-half of the real estate in fee, of which her husband died seized. The real estate, subject to these rights of the widow, goes, in the absence of issue, to the father of the deceased, if he is living. If the father is dead, it goes in equal shares to the mother, brothers and sisters of the deceased and their representatives. In the absence of any such relatives, it goes, in equal shares, to the next of kin. The residue of the personalty, after the widow's rights are satisfied, goes in equal shares to the same persons who take the residue of the real estate.

PENALTY FOR SELLING INTOXICANTS AT AGRICULTURAL FAIRS IN OHIO.

L. M., Newark, Ohio.—To settle a dispute, what is the law with regard to the sale of intoxicants at or near a farmers' fair in this State?

ANS.—In Ohio a judge of any court, sheriff, coroner, justice of the proper county, or a constable of the proper township especially appointed, shall, upon view or information, without warrant, apprehend any person selling intoxicating liquors in violation of law at or within two miles of the place where an agricultural fair is being held, and seize the booth, tent or wagon, carriage, stand, vessel or boat at or from which such liquors are being sold, and convey the same to a place of safe-keeping and take the person so offending before some officer having jurisdiction, together with an inventory of the things so seized, and the officer before whom such an offender is brought shall proceed forthwith to inquire into the truth of the accusation. The articles so seized shall be bound for the payment of all fines and costs assessed against the accused in the proceeding, including the necessary expenses of seizing and detaining the same, and shall remain in possession of the officer who has made the seizure until the determination of the prosecution, and may be sold on process issued against the accused.

RESPONSIBILITY FOR DEFECTS IN A HIGHWAY.

L. T. M., Kingston, N. Y.—A short time ago, while driving along a public road at night my horse stumbled and fell into an excavation made in the road. There was no lighted lamp or other visible warning for travelers. My light wagon was damaged and I was thrown out and injured rather seriously. Who is responsible for damages?

ANS.—Every city, town or township is liable for damages for injuries caused by its neglect to keep the streets, roads and bridges in proper repair, or for making repairs in such a careless manner as to subject others to injury. Thus, as in the present case, if there is a dangerous hole in the highway, and a person or his horse, using ordinary care, steps into it and is injured, the town is liable for such injuries. In the present case there is no doubt on this point. The person suffering the injury should not contribute towards it by his own act. Thus, if he knew the road to be dangerous, he should advance with great caution, or if there is another road that will serve his purpose, convenient, he must use it to avoid danger.

WATER PRIVILEGES ON ANOTHER'S LAND.

"Subscriber," Michigan.—A owns a farm in this State on which a pond is situated. Its outlet or raceway for about 200 feet runs across A's land and then down to the mill through B's land. B, the owner of the mill, holds a deed couched in the following language: "and a dam and mill pond to be used as a water privilege for a mill." Has A the right to enter upon the pond and cut and carry off the ice or allow others to do so? In fact who owns the ice?

ANS.—Here are a dam and mill pond on A's land from which a race-course runs into land owned by B, which has been purchased with the privilege of using the dam and water as a water privilege for a mill. A is entitled to make any use of the pond not inconsistent with B's water privileges. Unless cutting the ice would injure the water power, by diminishing the flow through the race-way, A may cut for himself or lease the right to others. B has no such right, and it can be derived only from A who owns the fee.

DESCENT OF A WIFE'S PROPERTY.

S. M. L., Watertown, N Y.—1. Can a married woman will her entire personal property as she chooses, giving no part of it to her husband? If not how is her will limited? 2. If she should die without having made a will, and after having had living children, what disposition does the law make of her real and personal property? 3. Can a married man will his entire personal property away from his wife?

ANS.—1. 3. In this State a married woman may dispose of her personal property, in whole or part, by will as she chooses, giving her husband no share therein. A married man has the same privilege with regard to his wife. 2. If a married woman die intestate leaving a husband and children by him, the husband has a life interest in the real estate, the fee going to the children in equal parts; that is, the property goes to them equally after their father's death. One-third of the personal property goes to the husband, and two-thirds to the children in equal parts.

A WIDOW'S RIGHTS OF INHERITANCE FROM AN INTESTATE HUSBAND.

R. H. T., North River, N. Y.—If a man dies without having made a will, can the wife hold one-third of the property that she helped to get; or can the other heirs take all leaving her penniless?

ANS.—If a man dies intestate in this State his widow is entitled to a life interest in one-third of his real estate whether any children were ever born to them or not. Of the personal property one half goes to the widow and one half to next of kin; but if there is no parent, brother or sister, nephew or niece, the widow takes the whole of the personal property. If there be a brother or sister nephew or niece, and no parent, the widow is entitled to one-half the personality and to the whole of the residue if it does not exceed $2,000; if the residue does exceed $2,000, she is entitled, in addition to her half, to $2,000, and the remainder is to go to the brother or sister, nephew or niece.

S. M., Genera, N. Y.—I left three farm wagons in a shop for repairs together with some harness. The shop and my goods were burnt. There was a policy of insurance on the former; but in it no reference was made to goods held in trust or for repairs. Can I collect the value of my property?

ANS.—Unless there was insurance directly or by implication on property other than that owned by the shop-keeper, there can be no claim for the loss described and it falls on our inquirer.

"EDITOR'S BACK STAIRS."

THE INTERESTING VIEWS OF THE LATE DR. J. G. HOLLAND.

THE columns of the newspapers appear to be flooded with proprietary medicine advertisements. As we cast our eye over them, it brings to mind an article that was published by the late Dr. Holland in Scribner's Monthly. He says: "Nevertheless, it is a fact that many of the best proprietary medicines of the day were more successful than many physicians, and most of them, it should be remembered, were at first discovered or used in actual medical practice. When, however, any shrewd person, knowing their virtue, and foreseeing their popularity, secures and advertises them; then, in the opinion of the bigoted, all virtue went out of them."

Is not this absurd?

This great man appreciated the real merits of popular remedies, and the absurdity of those that derided them because public attention was called to the article and the evidence of their cures. If the most noted physician should announce that he had made a study of any certain organ or disease of the body, or made his sign larger than the code size, though he may have practiced medicine and been a leader in all medical counsels, notwithstanding all this, if he should presume to advertise and decline to give his discovery to the public, he would be pronounced a quack and a humbug, although he may have spent his entire life and all his available funds in perfecting his investigations.

Again we say, "absurd."

If an ulcer is found upon one's arm, and is cured by some dear old grandmother, outside of the code, it will be pronounced by the medical profession an ulcer of little importance. But if treated under the code, causing sleepless nights for a month, with the scientific treatment, viz., plasters, washes, dosing with morphine, arsenic and other vile substances, given to prevent blood poisoning or deaden pain, and yet the ulcer becomes malignant, and amputation is made necessary at last, to save life, yet all done according to the "isms" of the medical code, this is much more gratifying to the medical profession, and adds more dignity to that distinguished order than to be cured by the dear old grandmother's remedy.

This appears like a severe arraignment, yet we believe that it expresses the true standing of the medical profession in regard to remedies discovered outside of their special "isms." One of the most perplexing things of the day is the popularity of certain remedies, especially Warner's Safe Cure, which we find for sale everywhere. The physician of the highest standing is ready to concede its merits and sustain the theories the proprietors have made—that is, that it benefits in most of the ailments of the human system because it assists in putting the kidneys in proper condition, thereby aiding in throwing off the impurities of the blood, while others with less honesty and experience deride, and are willing to see their patient die scientifically, and according to the code, rather than have him cured by this great remedy.

Yet we notice that the popularity of the medicine continues to grow year by year. The discoverer comes boldly before the people with its merits, and proclaims them from door to door in our opinion much more honorably than the physician who, perchance, may secure a patient from some catastrophe, and is permitted to set a bone of an arm or a finger, which he does with great dignity, yet very soon after takes the liberty to climb the editor's back stairs at 2 o'clock in the morning to have it announced in the morning paper that "Dr. So-and-so was in attendance," thus securing for his benefit a beautiful and free advertisement.

We shall leave it to our readers to say which is the wiser and more honorable.

FREDERICK T. ROBERTS, M. D., Professor in the University College, London, Eng., Examiner in the Royal College of Surgeons, calls attention to the fact that head-ache, dizziness, bronchitis, inflammation of the lungs, derangements of the digestive organs, are common symptoms of kidney disease. Warner's Safe Cure cures these symptoms by removing the cause and putting the kidneys in a healthy condition.

CATALOGUES, ETC., RECEIVED.

THE ROSE GARDEN, by William Paul & Son, Waltham Cross, London, England. The first edition of this magnificent work was written 40 years ago. Much of the present (ninth) edition is rewritten. To express it in familiar words, this book is 12 x 10 inches in size, 365 pages, large, clear print upon heavy paper of the finest quality. There are 20 strikingly beautiful colored plates of our finest garden roses, 16 full-page wood engravings and 80 smaller engravings. The work is in two divisions. The first embraces the "History and Poetry of the Rose, the Formation of the Rosarium and a Detailed Account of the Various Practices Adopted in the Successful Cultivation of this Popular Flower."

The second division contains an "Arrangement, in Natural Groups, of the most esteemed varieties of roses recognized and cultivated in the various rose gardens, English and foreign, with full Descriptions and Remarks on their Origin and Mode of Culture."

Finally, in an appendix are two valuable articles on, first, "The Botany of the Rose," illustrated, and, second, "The Entomology of the Rose," also illustrated. The book closes with a list of "Works on the Rose with Date of Publication and Author's Name," and a plain, comprehensive index. It is bound in cloth and the price is $5.10—21s. The same work (Imperial 8vo., illustrated with wood-cuts only) is $2 55—10s 6d. This is probably the finest work of the kind ever published.

LADOGA WHEAT.—This is the general subject of bulletin No. 4 of the Canadian Experiment Station, sent by Wm. Saunders, Ottawa, Canada. There is no problem that more vitally concerns the future of Canada than that of evolving early-ripening varieties of hard wheat and other grains. The soil of the great plains of the Northwest is so liberally supplied with fertility that its productive capacity can hardly be estimated. But with this vast store of fertility is coupled a season so short that the ordinary varieties of wheat are, in the majority of instances, killed by the frost. Nature has distributed her favors with a just hand. She has given to the cold North, with its short season of warmth the power to produce wheat of the highest quality, absolutely necessary in the production of the finest flour. If, then, a wheat can be found that combines with the finest flouring quality an ability to ripen before the danger from early frosts, the agriculture of the Northwest will be safe and permanent, because it can monopolize a product that is an absolute necessity. This is about the reasoning of the directors of the Canadian Experiment Station. They decided that the Ladoga wheat—a native of Northern Russia—gives the best promise of all varieties they could find. Samples of this wheat were sent to various parts of Canada and this bulletin deals with the facts brought out by this distribution, chemical analysis of the wheat and other tests. The conclusion seems to be that the wheat is well worth trying and that it will doubtless adapt itself to the demands of Canadian agriculture.

WILLIAMS'S MOWER AND REAPER KNIFE-GRINDER.—Circular from the Williams Brothers' Manufacturing Company, Naubuc, Conn. This machine is so simple that a boy can grind machine knives with perfect accuracy. With this machine the bevel of knives can be adjusted readily and every knife ground on the same bevel, or otherwise, as desired. This appears to be a very useful little machine, and we hope our readers will send for the circular and see what they think of it.

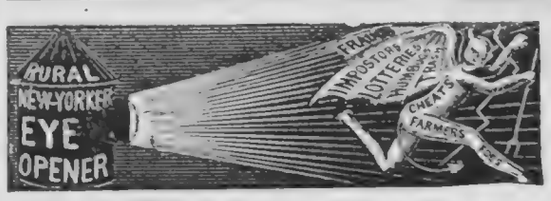
RECORDS OF DAIRY COWS.—Bulletin Number 32 of the Massachusetts Experiment Station. This is quite an important dairy publication. In many respects, the experiment it records is unique and so directly in the line of practical dairy usage that it points out a startling truth. It was proposed to copy, as far as possible, the conditions found on the average milk dairy farm. Twelve cows, grades of the different breeds, were bought as soon after calving as possible. They were milked until their daily yield of milk fell below five or six quarts when they were sold to the butcher. Thus two cows cost from $57 to $72, while they sold for $25 to $35 each. A careful record was kept of the food consumed, the milk yielded, and weights of the cows at different periods. The result is that we have a series of very important figures showing the relative profit of each cow, and the cost of milk from such a herd.

We desire in this review simply to call attention to a few points of particular importance. The bulletin is of such value that every milkman who buys and sells cows ought to have it. Before giving any comparative figures, we may say that the milk was sold at three cents per quart. The profit of the cow is reckoned as follows: The original cost of the cow is added to the cost of her feed. This sum is subtracted from the sum of money obtained from the milk produced by the cow and the price obtained for her from the butcher. The value of the manure was estimated at the usual rating given by the chemists for the food, less 20 per cent. taken by the milk. For example; one cow ate $59 worth of food. It was estimated that her manure was worth $22.27. As the value of manure is so greatly dependent upon the care that is taken of it, it is hardly fair to give this value without explanation.

Of the 12 cows two were grades of the Jersey, two of Short-horn, one of Devon, five of Ayrshire, one of "Dutch," and one native. The cow giving the best returns, exclusive of any valuation for the manure, was an Ayrshire. This cow was milked 584 days. She cost $60 originally, gave milk valued at $203.37, consumed food worth $135.05 and sold finally for $28. A Jersey cow, eight years old, was milked 599 days, but her milk yield was less than that of the Ayrshire. Perhaps she would have made more butter, however. This cow cost the same as the Ayrshire, but sold for $3 less. The poorest cow in the lot was a Short-horn grade. She gave only $75.83 worth of milk, and ate $80.08 worth of food. Taking the cash profits of the cows, exclusive of the manure, it is found that one cow paid over $35, two over $20, five over $15, two over $10, one under $5, while one lost $34. Nine out of 12 therefore made a profit of below $20. The one bad cow that lost $34 reduced the average of the entire herd. Is there any such cow in your herd? Two cows were bought on the same day, sold on the same day, and fed the same quantity of grain. They were of the same age also. The cows were milked 374 days. Here is the record.

	COST	SOLD FOR	QUARTS MILK	LBS. GRAIN	HAY	PROFIT	VALUE OF MANURE.
Jersey.....	$63.	$25.00	3,724	1,947	4,228	$12.73	$22.27
Ayrshire....	$65.	$26 50	4,063	1,947	5,122	$17.75	$24.69

GIDDINGS & READ, RUTLAND, VERMONT.—A variety of field corn called the Giddings is said to have been carefully selected from and improved during the past 100 years. It is represented as "the most perfect type of corn grown in this section" and certain to mature in the most unfavorable seasons. This catalogue offers a first rate list of potatoes among which are Albino, Summit, Gov. Foraker, Mrs. Foraker, Crown Jewel, Nott's Victor, Delaware, Ben. Harrison, Rogers's Seedling, etc., etc. The catalogue itself, which will be sent to our readers on application, must be examined for descriptions.



THE SAME OLD STORY, with hardly a variation. Victim, farmer Daniel Keller, aged 70, the owner of several fine farms in the neighborhood of Bear Gap, Northumberland County, Pa. Time, last Monday. Loss, $4,700. A week before the close of the play a well-dressed, middle-aged stranger of engaging manners called on Keller and said he wanted to buy a farm. Keller showed him about one of his; but the deal hung fire and the agreeable stranger remained at the farmhouse as a guest. Last Monday a well-dressed young man appeared on the scene in the character of a son of John B. Packer, President of the Bank of Sunbury. He wanted to buy a Short-horn bull. Keller invited the two strangers into the parlor, and in course of a pleasant conversation, the last comer produced a pack of cards, and proposed to show the others a fine trick. He selected the ace of spades and two spot cards and began tossing them about, face down. The trick was to select the ace.

The original stranger tried his hand with varying success, and then the self-styled Packer said he would bet $5,000 that neither of his companions could pick out the right card. At this Stranger No. 1—who, of course, was a perfect stranger to Stranger No. 2—picked up the winning card, gave the wink to his friend Keller, bending the end of the card so as to leave a slight crease. "I'll go you $5,000 on that," said the farmer, who had by this time become greatly excited at the sight of a certain way of scooping in a large sum in a moment. The cards were again thrown and Keller picked up the creased one and turning it over, exclaimed: "There you are: now pass over the money." The young man frankly acknowledged that he owed the farmer $5,000 and produced a big roll of what appeared large bills, to show that he was prepared to pay it.

"You can't have it, however," said he, "till you show you made the bet in good faith. Show up your dust so that I can see you could have paid me had I won in place of yourself." Keller said he had the money all right, and after rummaging different hoarding-places in the house, laid $4,700 on the table. Quick as a flash, his old friend, Stranger No. 1, whipped out a revolver and sticking the muzzle against the old man's pallid brow, swore he would blow his brains out if he uttered a cry or moved hand or foot. The other man grabbed the money and fled. Then his pal, still covering the victim with his revolver, backed to the door, passed out, closed it, and sped away after his confederate. When old Keller had recovered enough to make his way to Sunbury, no trace could be discovered of the rascals. Does 70-year-old farmer Keller take the RURAL? Certainly not. If he did, he would now be vastly richer in general knowledge and $4,700 richer in cold cash.

A DEVICE for swindling farmers, that has of late been pretty extensively practiced in some parts of the country is the following: An offer is made of nursery stock, which need not be paid for till it bears fruit, when pay will be taken in fruit. Nothing could be fairer, eh? No fear then of losses from growing plants untrue to name! Of course, however, a note is incidentally required, merely as "a matter of form;" and to insure that it shall not pass to strangers, the words "Not transferable," are boldly written on the face of it. In spite of all, however, it is sent back for collection by some "innocent holder;" but now the words written boldly on its face are "Note transferable," so that it has become "negotiable paper." As a rule, some bold bluffing by a smart lawyer soon exacts payment; but it is very doubtful whether any jury would render a verdict in favor of such a clear case of swindling.

"CURWIN'S HOG-POWDER," puffed up by a Pennsylvania humbug as "sure cure" for swine plague or cholera, has been analyzed by Dr. G. C. Caldwell, Chemist of the National Agricultural Experiment Station, at Ithaca, N. Y., and he says the mixture consists substantially of 78 per cent. of common salt, the rest being sulphur, charcoal and copperas. The whole would be worth only 25 cents per pound, and, as Director I. P. Roberts remarks, if these substances could do what is claimed for them, "hog cholera" would have been wiped out of existence years ago, "for they have all been fed in large quantities to hogs for this very purpose."

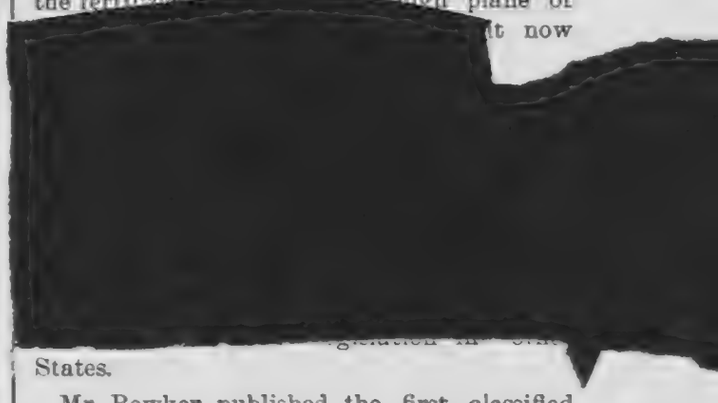
FERTILIZER MANUFACTURE.

A WONDERFUL CHANGE IN FIFTEEN YEARS.

IT is hardly possible to realize the great progress which has been made in the fertilizer business during the past fifteen years. In 1871 Dr. James R. Nichols, speaking before the State board of agriculture, said he had investigated seventeen of the most popular superphosphates and found that the difference between their plant-food value and their selling price gave an average loss to farmers, upon every ton purchased, of $4 90, and he added. "I have reached the conclusion that it is impossible for manufacturers to supply . . . any compounded fertilizer so as to give the farmer a just return for his money."

The following year the president of the agricultural college—Hon. Wm. S. Clark—at the State board meeting grouped in one class horse jockeys, rumsellers and fertilizer manufacturers.

During these years a young man had graduated from the Massachusetts agricultural college and started in the manufacture of fertilizers. He was a farmer's son who had worked his way through college fitting himself especially for this business. This young man—Mr. W. H. Bowker—started out with the idea that the manufacture and sale of commercial fertilizers was as legitimate and honorable business as any, if honestly conducted. The late Capt John Moore of Concord, Mass., voicing the sentiment of the time told him: "If you remain honest one year you will do more than any other man who has gone into the business;" yet he persisted in his course and to-day can claim the honor of having been one of the prime factors in the great change that has taken place both in public sentiment and in the uniformity and the reliability of commercial fertilizers. As the New England *Homestead* very justly says: "Mr. Bowker has been a power in elevating the fertil[illegible] high plane of [illegible] now



States.

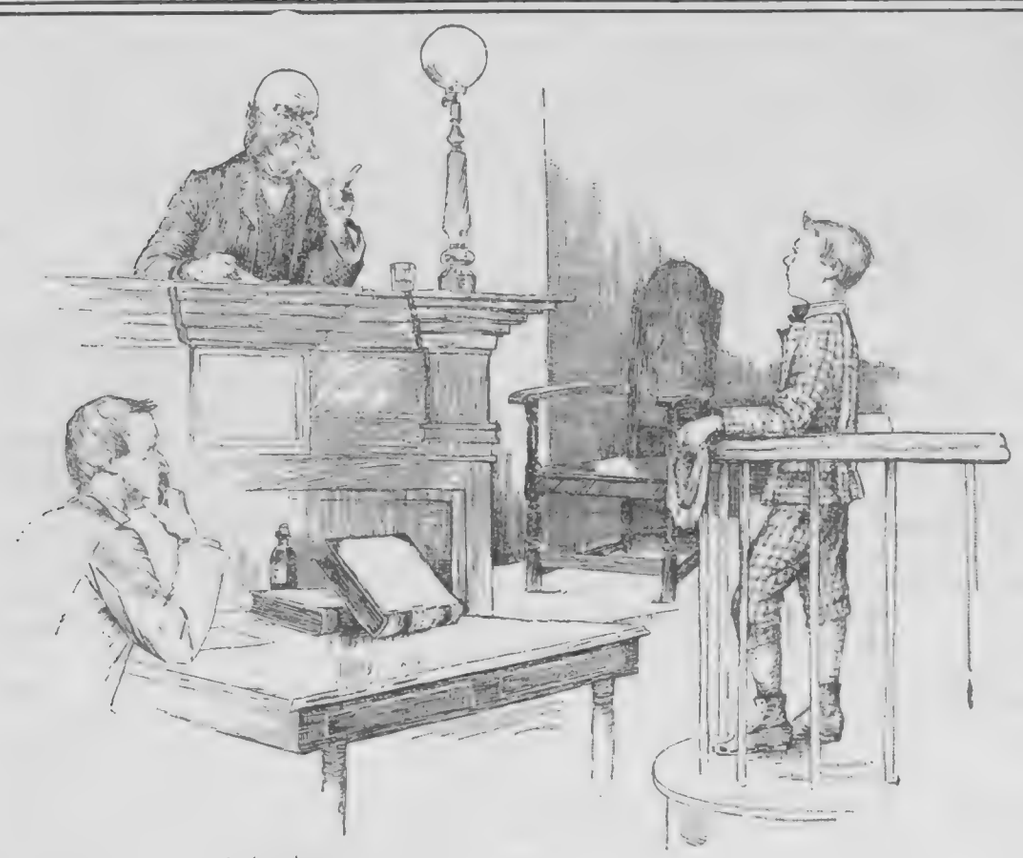
Mr. Bowker published the first classified agricultural chemical price list in the country, and sold the first muriate and sulphate of potash to farmers in New England, and also introduced sulphate of ammonia for agricultural purposes.

Probably no one in the business has been consulted more by experiment stations or has supplied so many chemicals for experimental purposes. Only recently his concern has been favored with a large order from Secretary Rusk of the United States Department of Agriculture at Washington to be used in carrying on important experiments with reference to peach yellows.

It would take quite a chapter to show what the Bowker company and its energetic founder have done to place the business on a good footing, for it is one of the most progressive concerns in the country in the fertilizing business and has been alive to every new improvement.

The great work, however, of this company has been the introduction of special manures under the name of Prof. Levi Stockbridge, which at first was much ridiculed, partly because they were the first manufactured fertilizers that contained potash; but the principle is now recognized by practical and scientific men as being the only rational basis of fertilization.

The Bowker company is also undoubtedly as well equipped as any concern in the country to do the business. It has two large factories, it manufactures its own sulphuric acid, has its own steamboat in New York harbor and a large phosphate mine in Canada. Its sales have grown from 125 tons in 1873, (which Mr. Bowker, assisted by Mr. L. A. Sparrow the present chemist of the company, personally manufactured and sold), to over 30,000 tons in 1888, or 100 tons for every working day of the year. We have watched the progress of this concern from the beginning, and it is a pleasure to note its success. Its efforts have been justly appreciated by the farming public, for it was the pioneer company to put the business on a scientific basis, stating what it sells and selling what it states. Mr. Bowker has by his methods on his merits won a prominent position in the agricultural world, both as one of the trustees of the State college and as a writer and speaker on agricultural topics.—*New England Farmer.*



BOTH IGNORANT.

JUDGE: "Do you know where you will go to, little boy, if you swear to what is not true?"

BOY (of radical tendencies): "No; nor you either."

THE
Mapes Manures
FOR

POTATOES. Applications may also be made at hoeing or cultivating. Over 300 bushels per acre in large fields; over 500 bushels on single acres.

Full details of how these and following crops were grown are given in pamphlet, also in RURAL NEW-YORKER and other agricultural journals.

CORN. Sweet Corn. Fodder Corn. 1,040 bushels ears corn on less than 4½ acres on farm of RURAL NEW-YORKER, equal to 116¾ bushels shelled corn per acre.
Over 37,500 salable ears sweet corn on 2½ acres.—R. W. SCHWARZ.
Over 11,000 ears sweet corn on one measured acre.—DR. HENRY STEWART.

CABBAGES. Out of 150,000 cabbage plants not more than 1,000 were not cut. —VREELAND & Co., Truckers.
Out of 40,000 cabbages, at least 97 in every 100 were salable.—DANIEL KUEHN, Trucker.

HUNGARIAN GRASS.

TOBACCO. Several crops, over 2,100 pounds per acre of Havana leaf, satin finish, glossy wrapper.

TRUCK. CARROTS, ONIONS, CELERY, TOMATOES for canning, GHERKINS MELONS.

OATS. BUCKWHEAT.

GRAPES. Pear, Apple, Peach Trees, Etc.
Yield of vineyards nearly doubled by single applications of Mapes' Fruit and Vine Manure.

MANGOLDS.
Seeding Down to Grass, Mowing Fields, Lawns; also for Top Dressing.

There is no complaint of grass not catching after grain crops, or land failing to produce as much hay as in former years by the continued users of the Mapes Manures. Many large sellers of hay have used *only THE MAPES MANURES* for many years past. Grass lands fully restored and maintained by the Mapes Grass Top Dressing applied in spring.

Send for official reports of State Agricultural Experiment Stations on the Mapes Manures. These Manures are found to be the *highest grade* and the *cheapest* of all manures to the farmer.

Prizes amounting to thousands of dollars offered by the American Agriculturist and the Mapes Company for largest crop of Potatoes, corn, oats and wheat grown in 1889 on one acre with the Mapes Manures. Send for Prize Competition Book—no charge. Send for pamphlet describing how the large, unprecedented crops are grown with the Mapes Manures.

Applications at Hoeings.

APPLICATIONS MAY BE MADE to all hoed crops at any hoeing or cultivating, no matter if crop be liberally manured. These applications have often been found to be the most PROFITABLE—that is, the increased yield from the after applications showed as compared with the balance of the field the LARGEST PROFIT on the outlay for the fertilizer.

Send for pamphlets. Special attention to securing best freight rates on any quantity from one (200 lbs.) to car load. Pure Peruvian Guano in stock.

The Mapes Formula and Peruvian Guano Co., 158 Front Street, New York.

The Very LATEST AND BEST
THE BEST HARROW or CULTIVATOR MADE.

BUCKEYE SPRINGTOOTH CULTIVATOR

Many Farmers favor level Cultivation for corn, and there is a demand for a Combined Corn Cultivator and Harrow or Fallow Cultivator. This we have accomplished in the machine represented by the cut. It is attached to our regular Cultivator Frame. Without the center teeth it is a complete Corn Cultivator and with the center attachment is a perfect Fallow Cultivator or Harrow.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

PHOTO ENG. CO., N.Y.

VOL. XLVIII. NO. 2048 NEW YORK, APRIL 27 1889. PRICE FIVE CENTS, $2.00 PER YEAR.

[Entered according to Act of Congress, in the Year 1889, by the Rural New-Yorker in the Office of the Librarian of Congress, at Washington.]

Biographical.

THE ASSISTANT SECRETARY OF AGRICULTURE.

EDWIN WILLITS, whose appointment as Chief Assistant to Secretary of Agriculture Rusk was recorded in the RURAL two weeks ago, was born at Otto, Cattaraugus county, N. Y., in 1830. When he was six years old his parents moved to Michigan and in that State he has since resided. He graduated from the Michigan University in 1855, and at once applied himself to the study of law. He has always been a marked figure in public life, filling various official positions with credit. He was elected to the 45th Congress and served his district three terms with marked ability.

In 1882, Mr. Willits was elected principal of the State Normal School. On the resignation of President Abbot, of the Michigan Agricultural College, Mr. Willits was at once selected to preside over that institution. As president he has proved himself to be an able organizer and a thorough instructor. Perhaps the best idea of his success may be gained from the following resolution passed by the Michigan State Board of Agriculture:

Resolved, That in accepting the resignation of President Edwin Willits, the Board of Agriculture desires to place on record its appreciation of his faithful, intelligent and earnest labor in behalf of the Michigan Agricultural College. Under his administration there has been a continuous, progressive movement in college affairs, and while we, from the first, have had confidence in his ability to wisely manage the diversified interests entrusted to his care, we have been more than gratified with the success attending his enthusiastic and discreet efforts to broaden the scope of the college, and intensify its methods of popularizing industrial education, awakening the people of our State to an appreciation of the value of scientific attainments as an accompaniment of rural life. We recognize his ability to fill creditably the position of Assistant Secretary of Agriculture to which he has been called, and while we sincerely regret the loss to our college occasioned by his resignation, we can but feel complimented by his selection for so important a government position, and we congratulate the Administration on the wisdom of its choice.

In closing the relationship which has continued so pleasantly and profitably, our hearty good wishes will follow our retiring president in his new field of labor. Although he may follow new and broader avenues of usefulness, and make a larger acquaintance with the necessities of agriculture and means of meeting them, he will always be kindly remembered by the Agricultural College of Michigan as having given an added impetus to the progressive movement. CHAS. W. GARFIELD,
CYRUS G. LUCE,
WM. B. MCCREERY."

We show an excellent likeness of Mr. Willits at Fig. 97. We like his face. It is sound, honest and manly. The R. N.-Y. gives the new Assistant Secretary its very best wishes, and expresses the hope that he may be as successful in his new field of labor as he has proved himself in past duties and responsibilities.

On the editorial page of this issue will be found some extracts taken from a recent letter from Mr. Willits. May the hopes expressed in the letter be fully realized.

Dairy Husbandry.

HOW TO ADJUST PROF. F. G. SHORT'S SAPONIFYING OIL-TEST OF MILK TO THE MILK DIVIDEND.

No. I.

IN the convention of the Vermont State Dairymen's Association, held about the middle of January, Mr. F. D. Douglas, said he thought testing instruments were deceptive, as they only tell the butter content in the sample of milk or cream; but do not tell what proportion of fat the churn can take out. Now, I suppose that is the truth, and the worst of it is, it will always remain true. In view of it, what shall we do—forswear all testing of milk or cream, and let all progress revert to chaos and take the injustice of the old way as an unavoidable evil, or act on the light we have, and get the approximate justice we may? Long before Prof. Short's process had been tested enough and perfected to justify its claims for public use, every clear-headed tester of milk for butter fat, knew that Prof. Short's process would no more define the churn-yield than does the old and complicated chemical analysis. The mixture of the alkali with the milk causes a complete separation of the elements held in mechanical emulsion, as that result is achieved in the economy of the cow, and therefore when the fat is abstracted by the admixture of acetic and sulphuric acids, a greater per cent of fat is obtained than is abstracted by the churn—as a rule—though there are very rare exceptional cows, or cows in exceptional conditions, that give cream that yields up in the churn very nearly all the fat that chemical analysis shows there is in the milk.

We are, therefore, driven to the point of testing all samples in the very best practicable way, and the excess in per cent. of fat shown by the test, over that actually produced by the churn, will have to be prorated among the patrons, according to the weight of milk of each. The bulk of the dividend will be a very close approximation to exact justice, and will draw the line sharply between good and poor butter-cows. The excess in test-yields over actual results from the churn, will be small in any event, varying only as the "churnability" of cream varies, and that variation is as likely to pertain to one breed as to another, to one herd as to another, to good cows as to poor ones, and it also varies from day to day in the same herd, and the same cow even; so in that particular, there is a factor that yields to no system of testing whatever, so far as we know. We are therefore in doubt whether any system can ever meet it in any other way than by prorating the difference; for the variation is made by the cows, and their varying condition caused by food, drink, breed, (perhaps) about that we do not certainly know—and by time from farrowing, and by the time they have been gestating. Methods of testing can take no cognizance of these facts, but proceed to separate the elements actually in the sample of milk tested, the same as it would if that were the only morsel of milk in all the universe. Treating a sample of milk the same as the cream of the big or co-operative churn is treated, so far as to age before churning, ripening and either churning and weighing the sample, or reducing it to oil after churning, *does not* help the matter; for there is no positive evidence about which we know anything, that the cream in the co-operative churn yields the same per cent. of butter that the test churn does. On the other hand, we have evidence conclusive enough, that the cream yields its butter in the big churn when it fails to do so in the sample through churning and melting. Because it would not, and never did, uniformly and reliably do so—notwithstanding all our hopes, and the hopes of others—is the reason why Prof. Short's semi-chemical analysis was and is hailed as a boon, and is coming to be more and more relied upon.

So we come back to the point that the per-cent. defined by the test is not and cannot be expected to be a strictly true definition of the per cent. the churn will yield. This comes from the fact that the big churn varies its yield from the absolute per cent. of fat in the milk, from day to day, and from the variation in the results of churning and melting the test samples. There is a "sliding scale" to both; and a hit to-day may be a miss to-morrow; and the miss is as likely to be a minus as a surplus quantity.

What then do we want when we find the big churn is subject to causes over which we have no control, and we cannot certainly tell whether it will excel or be deficient in normal years—to-day or to-morrow? Evidently we need to eliminate the other "sliding scale; the one in the testing—if we possibly can. This is done, substantially, in Prof. Short's test, because it takes out that proverbial "last wrung drop" of fat every time, for the reason that the alkali destroys the natural emulsion of the milk, and the after application of a mixture of acetic and sulphuric acids separates the essential oil from the saponified fat in the milk.

In the next article I will continue the discussion of this very important subject, about which far too little has been said by the dairy and agricultural press; being overlooked, I suppose, because so few make a study of it, though it lies at the basis of true progress in dairying, which waits on a correct way to equitably divide the actual avails from pooled milk at all our great factories.

WISCONSIN.

[R. N.-Y.—On page 461 of the RURAL for 1888 we gave a full description of Prof. Short's process. It promises to supersede most other methods for determining the butter value of milk, hence our readers will do well to study it.]

Farm Economy.

Cultivating Young Crops.

HARROWS AS HOES.

IN CORN AND POTATO FIELDS

Lessening Hand Labor

WHAT FARMERS THINK ABOUT IT

DURING the past few years, farmers have told remarkable stories about the work done by the harrow on young corn and potatoes. It has been claimed that a good harrowing, just after the plants pushed through the ground, has saved one cultivating and one hoeing, besides the advantage obtained from working the soil about the plants at a time when no other implement could have been used. The R. N.-Y. has asked a number of farmers to tell us what they think of this practice. Here we have their answers, presented without further comment:

FROM FRED GRUNDY.

I think it does not pay to harrow young corn or potatoes. When the smoothing harrow was first introduced many farmers bought it to use on young corn to keep weeds down, level and mellow the land, etc., as shown in the pictures and set forth in the circulars. They soon learned, however, that the advantages of the new and remarkable method of corn culture existed principally in the minds of the manufacturers of the implement. When the land was perfectly clear of all trash the smoothing harrow gouged out very little corn; but the trouble was that not one acre in 50 could be found in that condition. Some advocated thicker seeding and "reducing the surplus" with the harrow, but that proved to be a pretty "thin racket." The harrow would take out an entire hill here and there, pick two plants out of a hill of three and leave hills of six and seven untouched. I prefer to have three or four plants in each hill and the hills a proper distance apart.

Some farmers harrow corn land immediately after plowing, plant, then roll, and harrow over once or twice more. This leaves the land in fine condition for the cultivator; but should a heavy, beating rain follow soon after, the soil will pack almost as solid as a road, and it must be stirred again by some means before it bakes, or there will be tribulation. Other farmers simply harrow once or twice over after planting, and this is generally considered the best practice if the land has been pretty well pulverized before planting. It does not pay to plant on rough, cloddy ground and then harrow. When this is done clods are dragged on hundreds of hills and the plants are either entirely smothered, or pressed over to one side and ruined. Cloddy and rough land should be pulverized *before* planting. I always harrow potatoes just before the vines appear. It destroys all young weeds, levels the trenches off nicely and leaves the land in fine shape for the cultivator.

Christian County, Illinois.

FROM PROF. A. J. COOK.

It is my practice to harrow my corn ground before the corn is up and until it gets five or six inches high. I do not raise potatoes. I use a very broad fine-tooth harrow with the teeth slanting back. This does no damage to the corn even when the latter is well up. Indeed I plant very liberally in drills—about 12 quarts to the acre—so that it will bear thinning. I plant with a common grain drill, using the outside teeth only. The other holes are stopped up with small pieces of wood. In this way I can plant 12 acres in half a day; though this makes lively work. As I space every alternate row with my eye, of course I can plant twice as much space as I could drill of common grain. I do this, first, because it mellows the ground and the corn comes much better; second, because the young weeds are thereby killed so that they do not bother later, and I do not have to hoe at all. After this harrowing I use only the spring-tooth harrow. Nearly all the best farmers here practice this method. The practice is increasing. I consider it a very valuable reform on the old ways.

Ingham County, Michigan.

FROM CHAS. MC DANIEL.

In working growing corn with a harrow or a substitute, I have used Breed's Universal Weeder for the past two years on heavy and light soils, on corn and potatoes planted both in hills and drills, and for putting in grain and grass seed, and I find it better than the harrow because it costs less and is more easily handled. It requires only a light horse and is especially advantageous upon hill-sides for finally working small-grain land, or for the corn crop. In using it, it is immaterial whether a crop is planted in hill or drill.

Sullivan County, N. H.

FROM J. B. BASSETT.

My practice has been to go over my corn land as soon as it is planted, with the harrow, for two reasons:—first, it obliterates old marks indicating where the corn is, thus preventing the gophers or squirrels from finding it until it comes up; and, second, the harrow stirs the ground and to some extent kills the weeds, especially if it is a dry time. The potatoes we served in the same way, but for the latter purpose only. After the plants are large enough to allow me to follow the rows easily, I go through the rows twice each way with a double-shovel plow—the best tool that I can find. The advantage of this tool is that it kills the weeds (our great enemy) better than any other tool I have used. It is difficult to find any tool that will take the place of the hoe for hand work on very wet ground. I have used the Universal Weeder, and find it a very excellent tool to use when the ground is dry and before the rows can be well followed by the shovel-plow. This tool can be used when the ground is dry upon any land. It is useful only in the very early stages of growth, and before any other instrument is suitable for the work. It can take the place of hand work only when the plant is very small or before it comes up. We never resort to hand work in this State in corn, and seldom in potatoes, although I think it would pay in case of the latter. Upon the whole, there is no instrument that equals the shovel-plow for this region. Our great enemies are the weeds, and any invention that would prevent their growth or exterminate those that have appeared would almost to a certainty insure a good crop.

Hennepin County, Minnesota.

FROM E. B. TRUE.

It pays to harrow corn and potatoes if the land is in suitable condition, where the soil is fine and free from stones, sods, roots or lumps of manure. Where these are abundant and a careless man drives the team, the crop will be more or less injured; but if a careful man drives the team and does not let obstructions drag in the rows, a fine job can be done. I use a Thomas smoothing harrow made light for this purpose. If the land is in fine condition, the harrow can be used until the crop is five to six inches high. The advantages are the killing of the weeds and the keeping of the ground fine and mellow. Every one knows that the best time to kill weeds is just before they come through the ground, and in no other way can this be done so thoroughly and easily as with the harrow. Any farmer that undertakes to farm as our fathers did—entirely or nearly so by hand labor—will make a failure and will say "farming doesn't pay!" This method of using the harrow is not much in practice here, but some of the best farmers do use it with satisfaction.

Orleans County, Vermont.

FROM GEORGE W. P. JERRARD.

I have never used a harrow upon my corn or potatoes before they were up, to kill weeds. There is always an abundance of farm laborers to be had in this section, and I have preferred to have this work done by careful hand labor. I have watched the harrowing process on my neighbors' potato fields from time to time; but I have invariably noticed that by far too many sets are dragged out or sprouts detached or mutilated for the practice to go into my fields Somehow the harrow teeth seem unable to discriminate between the weeds and the valuable plants, and when one of the latter happens to be in their way it is very sure to be injured. I find it the best policy to have every kind of work done upon my growing crops in the best possible manner; then when the harvest comes it is a poor season when I fail to get abundant crops.

Aroostook County, Me.

FROM L. W. CURTIS.

I have harrowed my potatoes for 20 years—long before I had a smoothing harrow. Since I have had the latter implement I use it for both corn and potatoes. As I plant my potatoes very early and they are some time coming up I run the harrow over them before the vines appear, then again soon after they are up. I plant in drills, with the rows 2½ feet apart. In about a week or 10 days according to the weather, and the starting of the weeds, I run the cultivator through, and before they start again I run through with a Prout's horse-hoe. I then run through with a double-mold-board plow which will do about all the hilling needed; but if the weeds start again before the vines are too large, I run through with the horse-hoe again, set so as to hill more. If the rows are just far enough apart the plow works splendidly. With corn, I run the harrow before the corn is up, and then follow up with a weeder, unless the ground is very free from stones. If it is so, the harrow can be used until the corn is six inches high. If the ground is stony, the weeder is better, as it can be lifted over any obstructions, and can be used until the corn is one foot high. I then use the Prout's hoe as long as needed. If these machines have been used at a proper time—say, just as the weeds are breaking through the ground—there will be no further trouble with weeds. If I do not want to sow grass seed, I hill a little, and that covers all the weeds in the rows. One advantage of this system is that I use no hand labor, which costs too much. Another advantage is that one can choose a hot, dry sunny forenoon and go over all the ground, while if the work is done by hand, rain may overtake him, and the weeds may get large and grow all the better for the hoeing. I know of no soils on which one cannot use, at least, two of the implements named, and these used at a proper time and in a proper way will always take the place of the hand hoe. One should always remember that they must be used before the weeds get much of a start, otherwise they will often help the weeds along. They can be used in hill culture as well as in drill. They can entirely supplant hand labor. I never use the hoe to plant or cultivate after the crop is up. As I have said, I do not believe any farmer can afford to use hand labor as it is too expensive. A man must use his brains if he wants to succeed with a machine. A harrow or a weeder run over a piece of corn or potatoes on a hot, dry, sunny day at the proper time, will kill all the weeds; but if used on a wet day or after the weeds are up it is worse than useless.

Worcester County, Massachusetts.

FROM IRVING D. COOK.

It is each year becoming more a matter of doubt among Western New York farmers, whether it is advisable to attempt to grow corn at a profit, when we consider the fact that no other crop grown by us comes more in direct competition with those raised on the vast and cheaper lands of the West, and eventually laid down in our nearest markets at the prevailing low prices. And it is only as we adopt the best known methods for cheapening its production, in regard to the preparation of the soil, application of fertilizers, planting, mode of cultivation, etc., that we can expect to grow this crop with any degree of satisfaction or remuneration. At the present time the manner of cultivation is a matter of increasing interest and investigation. The old method of performing the season's work of cultivation with the old-time "crotch" style of cultivator, allowing the rear teeth to run deep among the tender rootlets of the growing plants, the trench thus formed being permitted to remain, allowing free admission of air and the scorching rays of the sun, thus parching the soil and tending more or less to injure or check the immediate growth of the plant, is by many considered unadvisable and injudicious. Consequently new methods are being devised, and one that attracts special attention at the present time, is that of harrowing for the earliest cultivation. The common prejudice existing against this seemingly "heroic treatment," has prevented its general adoption, and it is only in isolated instances that I know of its being practiced.

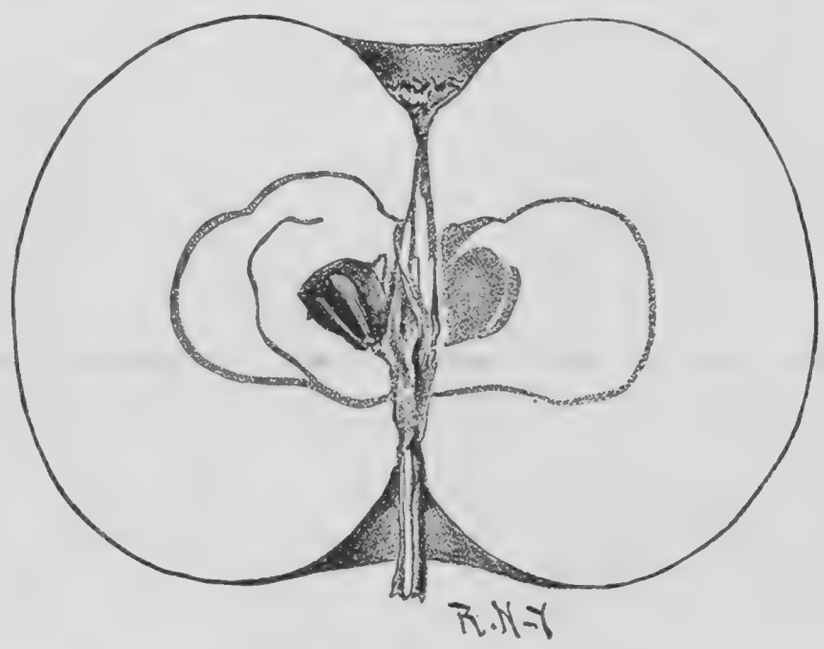
During the past season an adjoining neighbor for the first time harrowed a field of drilled corn intended for a field crop. The results were so satisfactory that he intends to repeat the operation the coming year. The implement used for this work was constructed as follows:—The teeth were those previously used in the ordinary spring tooth horse rakes, and were secured to two pieces of light scantling of sufficient length to harrow a space of the width usually taken in hay raking. This harrow was attached to a two-wheeled arrangement used for potato digging, in such a manner that the depth of the work could be regulated. The corn being in drills, satisfactory work could be accomplished by working across the rows, and a bountiful crop was harvested with clean culture and less labor than ever before. During the discussion of this question at our recent State farmers' institute, the unanimous verdict seemed to be in favor of this method, it being claimed by those with experience that it tended to loosen the dry crust of earth often formed after copious rains, thus allowing the plant to expand and retain a healthy growth, besides destroying myriads of tiny weeds, the rootlets of which permeate the soil in all directions. The Hon. Seth Fenner stated that, after an absence from his farm, he learned, much to his indignation and sorrow, that one of his workmen with a 40-tooth drag had harrowed his entire field of corn, and that he despaired of realizing much from the crop that year, and that, in spite of his remonstrance and gloomy forebodings, he learned a few days later that his man had been over the field with that drag again, and he concluded by saying that it finally resulted in one of the most satisfactory crops he ever harvested. For later cultivation I have for several years used a two-horse wheeled spring tooth cultivator, constructed in two sections. These are each V-shaped and are drawn, with the wide end ahead, on each side of the row as the work progresses. In this way deep cultivation is avoided: the action of the spring tooth creates a thorough agitation of the soil; no deep trench remains near the corn row; the soil at each cultivation is gradually moved toward the corn; the rear tooth leaving a slight trench in the middle of the space between the rows.

Harrowing potatoes is not practiced by any of the large growers of this locality. For first cultivation nearly all have adopted the method of covering the entire surface of the row, the young plants included, soon after making their appearance, the soil for the purpose being moved from between the rows with a two-horse implement constructed especially for the work.

Genesee County, N. Y.

FROM J. C. STRIBLING.

In this region the smoothing harrow is used to a considerable extent in cultivating young corn and cotton; but for cultivating with the harrow either crop should be planted with this object in view, and more seed should be sown to the acre, and the soil should be well pulverized and free from trash. Formerly the Thomas smoothing harrow was the universal implement for this work; but now the New Lever has the advantage of being changeable while the team is going, so that it can be made to run a little deeper on hard places, or more slanting on soft spots to suit the nature of the soil and work and preserve the stand. Here all our fields are more or less variable in character of soil, and on understanding what implement to use and how to use it hinges the success or failure of cultivation with the harrow. For corn or cotton, harrow just before the young plant comes out



THE RONK APPLE. Fig 98

of the ground, and again in five or 10 days, or as often as crusts form on the land or small weeds and grass appear, until the corn is six inches high and the cotton has four leaves, at which time the plow or cultivator should appear. If the value of the smoothing harrow were properly understood and if it were more used by the Southern farmers, it would save millions by clearing and cultivating the young crops at the busiest season of the year. In such times a good team and harrow used at the proper time would do more work in one day than six plows and 10 horses could do in the same time.

Anderson County, South Carolina.

Horseman.

CHAMPION TANDEM TEAM.

At Fig. 99 we show a picture of what is considered the champion English tandem team for 1888. The horses are Elegance and Denmark. The London Live Stock Journal has this to say of them:

"Elegance, foaled in 1880, was got by Beat 'Em from Graceful, by Dr. Barkley; Denmark, foaled 1881, was by Lord Derby 2nd from a mare by Denmark. Elegance has won over $10,000 in prizes, and jointly with her companion Denmark gained most of the prizes at the leading shows in the United Kingdom last season. They have never been defeated in tandem, and Elegance is considered the finest tandem leader in the country, her owner having refused several offers of $5,000 for her."

Many English breeders and farmers find a very profitable business in producing animals for fancy driving. Strong, handsome animals with stylish action and plenty of spirit, are in good demand. There is a good market for such horses in the larger cities of this country, too, and this market is capable of extensive development.

Pomological.

THE RONK APPLE.

Some weeks since several of these apples were sent to the Rural by Messrs. Albertson & Hobbs of Bridgeport, Marion county, Indiana. They were of such excellent quality that we have made a cut of a half-section which we present at Fig. 98. Messrs. Albertson & Hobbs say that this apple originated on the farm of Mr. Ronk, in Boone county, Indiana. In 1862 Mr. Ronk dug some seedlings from his father's orchard, and transplanted them to his own orchard, intending to top-graft such as did not bear desirable fruit. One sprout dug from under a Vandevere tree bore so well and the fruit was so valuable that it was not grafted. Since commencing to bear it has not failed to fruit when there were apples of any other variety.

The tree is growing on rather low, moist, black soil, is now 27 years old, 25 feet high, and one and a-half foot in diameter; spread of branches, 33 feet. It is the largest and healthiest tree in the orchard. It bore 20 bushels of apples last year. It is almost identical with Vandevere, and Mr. Ronk says that for profit it is worth any other two trees in his orchard. It has stood the test when the thermometer has dropped to 30 degrees below zero. The apples do not rot, or drop prematurely, as does the Vandevere, and they keep well into March and April in good condition. Trees of the variety are not yet for sale, and probably will not be for two years; meanwhile we shall watch its behavior with much interest.

Field Crops.

THE SWEET POTATO.

What shall be said here in regard to the cultivation of the sweet potato, is wholly for the Northern States. It is my intention to go into details, giving the results of my own experience for many years, as well as what comes from observation. The sweet potato is almost universally grown in the North from sprouts started in the hot-bed. In the South they are grown directly from the cut tubers planted in the hill, and they have been grown so North, but the former is the only reliable method.

GROWING PLANTS IN HOT-BEDS.

From the 38th parallel northward no tubers should be placed in the hot-bed before the first of April, and the best time is from the 10th to the 20th. For this, preparations for the bed should begin about the first and be completed by the 7th to 15th, a few days before the potatoes are laid down. Stable manure as for any other hot bed should be used, and if prepared by previous turnings as for early hot-beds, so as to take away some of the rank heat previous to its use, so much the better. At this advanced season less manure is needed than if the beds were made in February or March. A sheltered situation should be chosen and if the manure is not too strawy, 15 inches deep after packing will be sufficient, or, say, 17 inches at the north side and 13 at the bottom, and it may be all on top of the soil, or a few inches of the soil may have been previously dug out and put aside for bedding the potatoes. The manure should extend on all sides six to 12 inches beyond the frame. Place on this the frame five feet wide from north to south (five feet are preferable to six because of the difficulty of reaching to the center when pulling plants) and as long the other way as desired. A single sash five feet long by three wide will give room for about 1½ bushel of medium-sized potatoes.

The frame should be about 12 or 14 inches high at the back and 10 at the front. This with the slope of the bed will give enough pitch toward the sun and carry off the rain. Now put in three inches of soil—that partly sandy is to be preferred. Put on the sash and after packing manure around the outside of the frame, let that bed rest for a few days until the heat comes. If it is rank, raise the sash to let the heat escape and wait until it has partially subsided before putting in the potatoes. Glass sash can be used for a covering and some use boards, but I think oiled muslin is better than either. This, tacked on frames three by five feet, makes a light cover, sheds rain and lets in a partial light. When the bed is in the right condition, fairly warm, place the tubers in rows across it about half an inch apart, then cover them with three inches of light soil and place the covers. Watch the bed so that it should not get too hot, and as the plants come through give air by raising the covers behind when the weather will permit, and, later, in warm, sunshiny days they may be left off in the middle of the day. As the plants grow they will need water. Commonly small tubers are used and if not very small they will answer. Those of medium size are preferable to either small or large.

TRANSPLANTING

Many are in too great haste in putting them to sprout, and equally so in transplanting. Nothing is gained by getting them in or out very early, or only in exceptional seasons, so that the 10th of May is as early as any one should begin to put them out, and from the 20th to the last of the month is better, for they are then not only safe from frost, but, the ground being warm, they start off quickly. They can be put out with success up to the middle of June, and crops have been grown that have been planted the first of July. A moist time will be chosen of course for transplanting, but a good stand can readily be got in a dry time by watering as they are planted, and I have had fair success at a very dry spell without it. The secret of all transplanting lies in two things—keeping the roots moist until they are put in the ground, and making them firm by side pressure at the bottom and not at the top.

SOIL AND PREPARATION OF GROUND.

A light sandy soil is generally considered best. A light yellow loam well drained is also excellent. A black, rich soil although sandy, is not to be desired, although it may make a large crop, but this is likely to lack in quality and color. I speak now of the Yellow Nansemond, for nine-tenths at least of all those sent to market are of this sort, and these, to be of good bright color, which is an important point, must be grown in both a light-colored soil and a light one as to weight also.

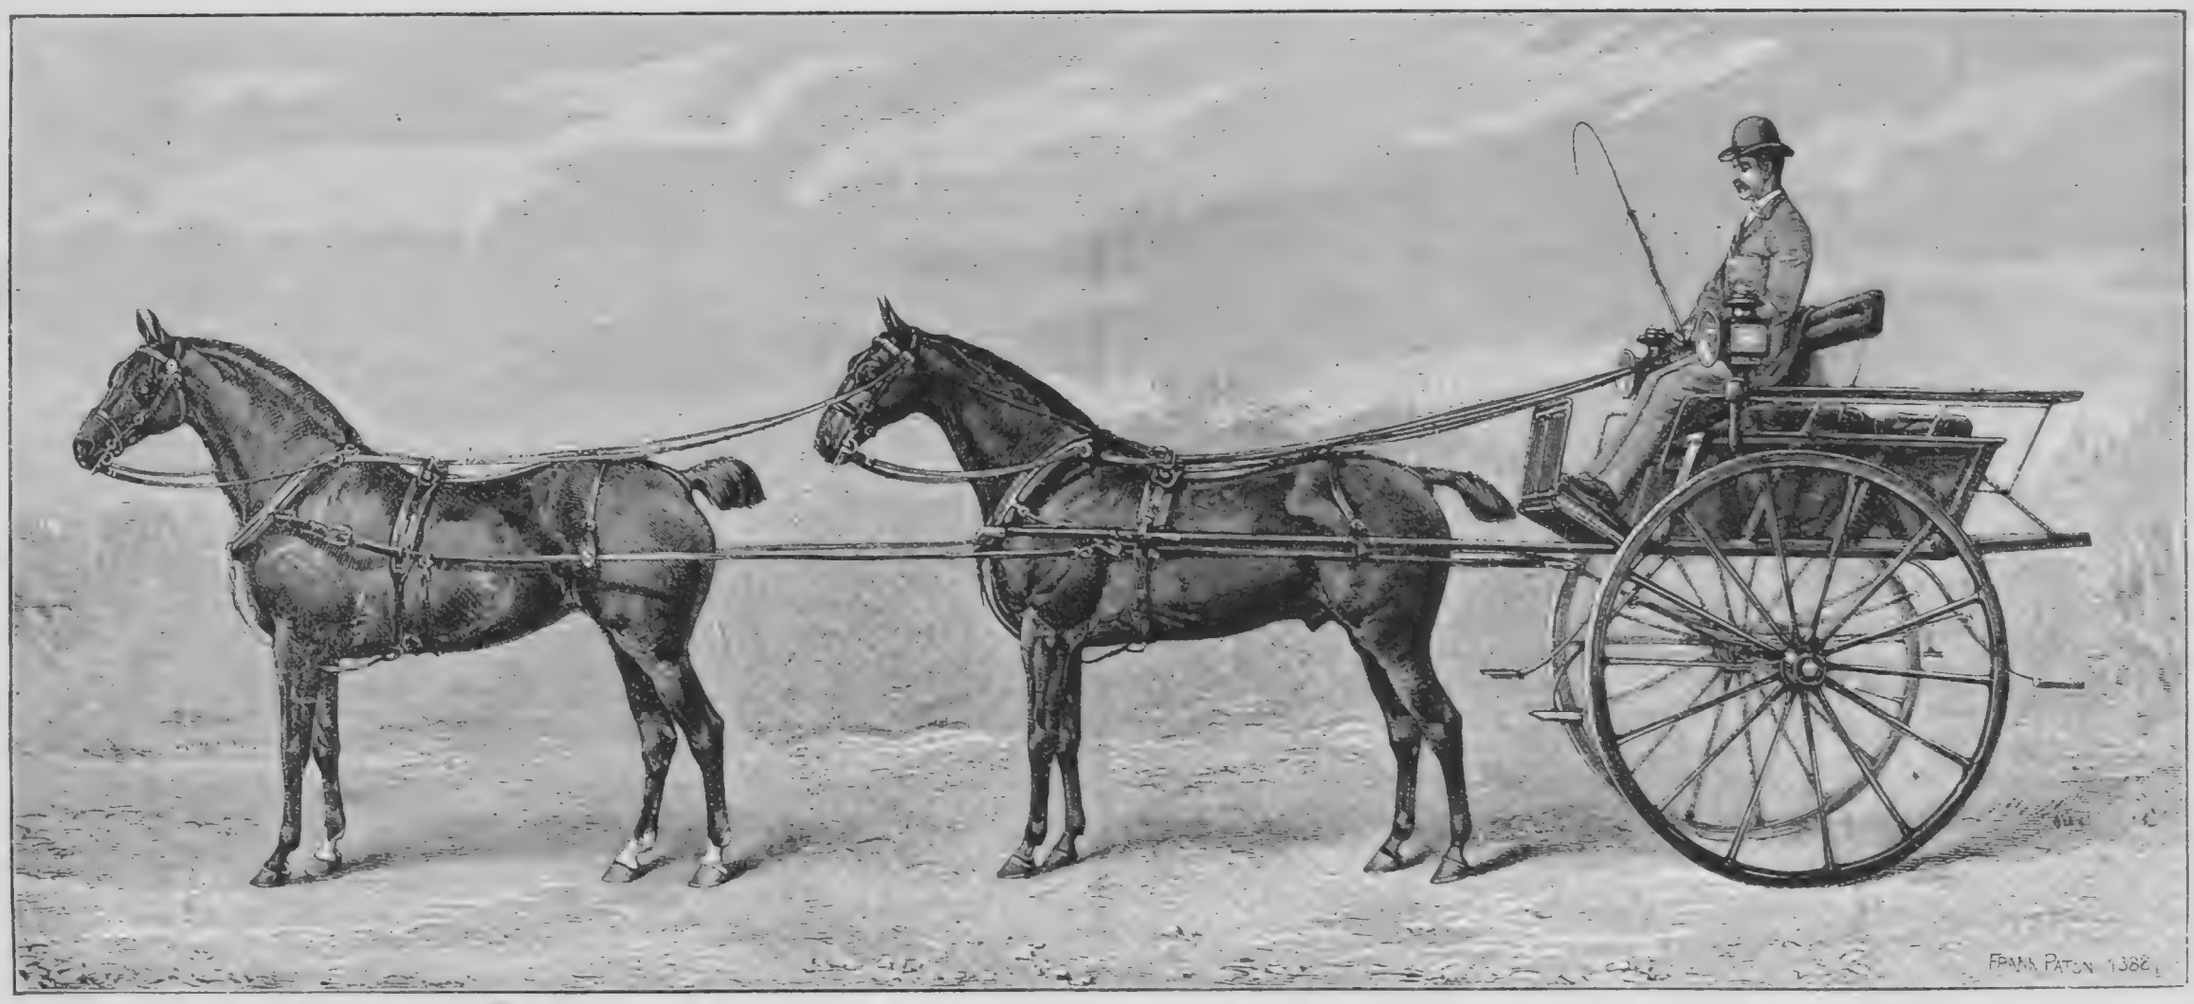
The ground should not be plowed deep nor should large hills or ridges be made. More can be grown to the acre in ridges than in hills, so that ridge culture is the common practice unless land is no object. The rows should be about three and a-half feet apart and the plants 15 inches in the row. The ridges should be small both in hight and breadth. Indeed I am satisfied, although I have not tried it, that a good crop could be grown without plowing the ground at all, (on light soil, I mean) simply by throwing up a moderate ridge; for it is important that the tubers should be short and thick and not long and slim.

The sweet potato needs much warmth and little moisture, and for this reason the suggestion that the Rural trench method would be suitable for their growth is seen to be a bad one. The object of the trench for the Irish potato is that it may have depth and therefore coolness and moisture, while the opposite is what we need in case of the sweet potato. Some years ago I tried level culture in sandy ground without success. They need to be in ridges that the sun may have its full effect on them, and that they may be free from much moisture. Good crops are grown in seasons so dry that the Irish potato would be a failure. Having got the plants established, the plow or cultivator should be run close to them and cut away part of the ridge. The next plowing should throw it back. This should be repeated so that at the fourth cultivation the ridge would be as at the beginning and this is generally enough, except keeping the middles stirred until the vines cover the ground. It is important that the ridge be formed before the tubers are set, and especially that after it has been done no considerable dirt be thrown to them. One experience settled this for me. A man, late in the season, was put to cleaning the rows in my garden. When seen he had drawn a large amount of soil on them. This was forbidden and the remainder were simply scraped free from weeds. The result was that the rows treated in the latter way yielded more than double in good-sized tubers than the other. As to cutting off the vines, I should not do it, and as to pulling them loose from the ground where they have taken root, my own experience has shown little difference whether it was done or not.

VARIETIES.

The Yellow Nansemond is the standard market variety and the best for home use or market and especially for the latter, for the large white and red ones will not sell except to a very limited extent. Out West we have been taught to think that the Yellow Jersey is a distinct variety, but it is evident that it is the Yellow Nansemond. Here in certain soils and with certain treatment it grows long and slim, while in New Jersey on soil adapted to it and with the proper cultivation, it is short and thick and of a bright color, and brings right here 50 per cent. more than home-grown, although they are grown from stock brought direct from New Jersey. The Red Jersey is fully as good as the Yellow and yet it is not salable, for no other reason than that it is one of the notions of the public. The Red Bermuda is one of the largest and earliest, growing to weigh six or seven pounds, sometimes. It is coarse and not dry and is only wanted by a few. The Southern Queen, a white sort and nearly as long in growth as the Bermuda, is better in quality but its color is against it. The Yellow Strasburg or Early Golden is also large and early and better in quality than either of the two preceding sorts, and is worth growing just for early use. This was introduced in the East by Bliss & Sons under the name of Early Golden, while in the West it is called Yellow Strasburg and had that name, as I believe, previous to its introduction East.

A new variety—the Extra Early Carolina—gives promise of being a fine sort. I have not grown it yet myself, but on good authority I am told that it is actually two weeks earlier than the Yellow Jersey and more productive, yielding for my informant 250 bushels to the acre. The sample I have resembles the Yellow Jersey, being of a fine gold color. The shape is exceptionally good; in size it is medium, and I find the quality superior to



CHAMPION ENGLISH TANDEM TEAM. Re-engraved from the London Live Stock Journal. Fig. 99.

that of any I have eaten this season. If on further trial these qualities are confirmed, there is reason to expect that it will supersede other sorts.

YIELD AND PROFIT.

One hundred bushels to the acre I consider a very poor crop. Once I had just 300 bushels on three acres and scarcely any of them were of good merchantable size. A fair crop should be placed at 150 bushels or more. At $1 a bushel as I have known them to average, they make a paying crop, but now with the increase of all vegetables, North and South, they frequently bring only 50 to 60 cents, but even at these prices they pay as well as other farm crops or better.

MANURING.

My belief is that land in good condition is preferable to that manured at the time, although I have not experimented in this direction. Some plow a furrow, fill it with manure and throw the ridge on top of it. Since the foregoing was written I have had a letter from a large and successful grower, in which he says that his land has a stiff clay subsoil. I presume it must be well drained. He remarks that on strong land in a wet season, the potatoes run to vine, while on thin land a good crop is made, but that, on the other hand, the latter would make a poor crop in a dry season.

Horticultural.

A LITTLE OF PEA HISTORY.

JAMES J. H. GREGORY.

Why it may be wise to have the same pea sold under different names; an experiment with peas; comparison between the yields of some standard varieties.

THOSE old English sorts known by our fathers as "Early May," "Early Kent," "Early June," one or all of them gifts of the Mother Country, were doubtless the original parents of all of our numerous varieties of early hard peas which are now catalogued under a score or more names, usually having, as a prefix, the name of some seedsman. I have no ancient catalogue at hand, but will venture a guess that Early Kent may be found to have been the original ancestor of the numerous progeny. Those who have tested all these early sorts side by side, have found a difference of two or three days in earliness in some of the varieties, a slight difference in size of pod, a greater inclination to bear twin pods in some cases and a slight difference in yield, with the habit of yielding all the crop at a single picking rather more fixed in some of the sorts. All these differences count for value among marketmen, yet in some instances the differences between those bearing different names are, if they exist at all, so infinitesimal that a question very naturally asked is "Why have so many names? Is there not far more distinction than difference in the whole matter of naming first early peas?" I have never sent into the market early peas bearing my name as a prefix. I think my good friends will concede that I can have no axe to grind when defending this practice among my fellow-seedsmen. The argument, in brief, is this.—

As it is found in practice that either from a tendency among early varieties to sport, or from carelessness in thrashing or cleaning them, degenerating impurities are apt to creep in, there is and can be no better protection for the public than follows from seedsmen giving their names to their first early kinds, for this compels them, out of regard for their reputation, to have such care exercised in the raising and cleaning of seed that if all impurities are not eliminated they are reduced to as low a percent. as is practically possible. The history of the early pea named Dan O'Rourke offers a good illustration of the individual responsibilty to keep an early pea from degenerating. When first sent out it was an excellent strain, but after a few years it became worthless as an extra early, losing its early habit and maturing unevenly. An effort is being made to recover its lost reputation, but it needs the name of some responsible firm whose reputation will thereby be involved, to insure the public that sufficient care will be exercised in selecting and perpetuating first-class seed stock. In all my experiments with peas, extending over many years and sometimes including 70 varieties annually, I have yet to find an earlier sort than Carter's Early, but it had the defect common to two or three extremely early sorts (and this means an advance of but two or three days) that the pods were small though numerous. A careful test of three seasons has, in each instance, demonstrated that the Alaska is not quite so early as other older sorts.

A word as to the comparative yields of a few well known varieties. Last spring I planted about an acre and a quarter of good pea ground to Hancock, Maud S, Earliest of All, Kentish Invicta, American Wonder, Advancer, Market Garden and Stratagem, with the object of getting facts as to their comparative yields. The land was remarkably even in its composition and lay, sloping gently to the south. It was manured the fall before with unleached, hard-wood ashes, at the rate of 250 bushels to the acre (by mistake of my foreman, twice as much as I intended) and after this had lain awhile and had been very thoroughly harrowed in, eight cords of barn manure were spread broadcast and left over winter at the surface. I went over the piece two or three times to see if there was any ammonia escaping, just after slight rains, but could detect none. In early spring it was plowed deep, furrowed out at a good depth with the furrows three feet apart; 500 pounds per acre of a fertilizer suitable for peas (one not rich in ammonia) were mixed well in the furrows by one of Spangler's distributing machines, and the peas were planted by a planting machine. They were not dropped as thick as I would have liked by one-third. They were run over when a couple of inches high by a New Hampshire implement called Universal Weeder, made of a series of long steel teeth set within a couple of inches of each other. This was run right through the rows, length-ways with good effect, destroying most of the weeds while doing but very little harm to the peas. At picking time by some oversight the crops of the very early varieties were mixed so there were no means of comparing them. The peas were planted in rows of equal length, several rows of each. The following is the average yield per row.

Market Garden....	4 bushels	2 pecks	5 quarts.
Advancer.....	4 "	0 "	4 "
Stratagem.....	2 "	2 "	6 "
Kentish Invicta...	2 "	2 "	4 "
American Wonder.	2 "	1 "	1 "

Three hundred feet of the rows of the Stratagem were brushed—none of either of the other kinds were, to compare the yield with an equal length of unbrushed. The former yielded one-eighth more and ripened a few days earlier—a difference that did not begin to pay for the extra labor required. As the American Wonder would probably have done as well proportionally, had they been planted one-third nearer, I incline to add a half to their yield, which gives a fair measure of what they are capable of. It should also count in their favor that they are much easier to pick than any of the other varieties named—one half more in the same time would be a fair allowance. The Advancer gives a handsomer and better filled pod than the Market Garden, and sells better: coming with us about the Fourth of July it can be sold with very little effort, as the market at that time is eager for all that it can get. The Stratagem is a very large pea with pods corresponding; it is of excellent quality and therefore desirable for the family garden.

Marblehead, Mass.

CANADIAN NOTES ON SMALL FRUITS.

My locality is near Toronto, Ontario. The climate is slightly milder than that of Northern Massachusetts or Milwaukee, Wis, but colder than that of Boston or Chicago. The area kept under small fruits by me is three acres. Time under cultivation, eight years. Soil, stiff clay, mostly low-lying.

GRAPES.—Worden is the best black I have tried. Wilder is finer and more prolific, but once in three or four years it is too late. Moore's Early yields but poorly. Champion is not fit to eat. Brighton is the best red I have tried. Jefferson and Iona have ripened perfectly only once in four years. Lindley is good, but sometimes the berries drop. The other Rogers's reds are sometimes late. Wyoming is the prettiest, but insipid. El Dorado is the best white I have thoroughly tested. It is early and fine-flavored; has very large bunches, nearly equal to those of the Lady Washington though the berries are much smaller. Pocklington is large, beautiful, strong-flavored and fairly prolific though a slow grower; but it drops its berries, and is rather late in ripening thoroughly every year. Niagara and Jessica I have scarcely tested. I find it pays to lay down the vines in fall, though others do not do so here.

STRAWBERRIES.—Seneca Queen is by far the most prolific of the largest berries. Jersey Queen is large but won't bear. Sharpless is watery. Downing is good. Bidwell would be the same if it would ripen to the tips. Manchester rusts. Mount Vernon is second to Seneca. Of the others, some are good; some so worthless as not to be worthy of note.

BLACKBERRIES.—Agawam is the best in quality among hardy sorts. Taylor is next. The others tested—a full dozen varieties—were too tender. Snyder I did not think worth trying to grow.

RASPBERRIES.—Turner is the best hardy red, very good but only fairly prolific. Cuthbert is not hardy, but would be on a drier soil. Hansell is almost worthless, being small, of poor flavor, a light cropper and no earlier than the Turner. Marlboro, Crimson Beauty, and several foreign sorts are worthless here, but Hudson River Antwerp and Herstine are fine. Shaffer is all that is claimed for it. Souhegan is the best black. Gregg is tender and unhealthy.

GOOSEBERRIES—All the English varieties succeed here. Mildew is scarcely known. Downing is the best native.

CURRANTS.—Blacks of all varieties have been failures. Reds thrive and bear but there is little demand for them. White, ditto.

PRICES.—Grapes, three to six cents per pound; strawberries, six to 10 cents per quart box; raspberries, seven to 10 cents; blackberries, 10 to 12 cents; gooseberries, $2 to $3 per bushel for English and $1.50 to $2.00 for native. Currants, five cents per quart for red or white, and 10 to 12 cents for black.

W. J. MCKINNON.

EXPERIENCE WITH SMALL FRUITS.

E. C. BRINSER.

As a small fruit grower of some years experience, I delight in testing new varieties, more especially strawberries. The improvements in new varieties over old have certainly been very great; but when I confine myself to the last decade of years I cannot see such marked improvements as the glowing catalogues would make us believe. While some varieties are great advances in one point, they lack in another, or doing well in one locality they partially or utterly fail elsewhere. Having fruited a number of new and highly recommended sorts in the last few years, I have found a few which succeed so well in my locality and soil that I am inclined to think they will supersede some of our older staple kinds.

STRAWBERRIES.—Among these the Jessie strawberry is very large, of high quality, very firm and productive, vigorous in growth of plant, and free from rust or blight; but I cannot see in it any particular improvement over the Sharpless which seems at home with us, unless it be in two points—first, its even ripening, showing no white tips; and, second, its hardiness of blossom, as it bears a greater degree of cold without injury than the Sharpless and can be grown successfully where the Sharpless fails on the latter account. Bubach I find to be all I see it recommended for, being a good and strong grower, and healthy, and it has produced more exceedingly large berries than any other sort I have ever seen; but it is not so firm or of such high quality as one could wish. Did it contain quality and firmness in as high a degree as Jessie or even Sharpless, I would put it down as a decided improvement on all. Gandy's Prize I am now inclined to think will supersede the Manchester, which we plant here for late. It is later, a luxuriant grower, healthy, and free from rust which so much affects the Manchester some seasons. The fruit is larger, of better quality, and more firm. If it holds its qualities and proves productive enough, it will be a decided improvement on the Cumberland. This is with me the best early (old) berry I have yet had. While some others are a little earlier, they are either deficient in size or quality, so that if a few boxes can be sold at a greater price the balance must be sold for less. Sharpless (old), our midseason berry, is or seems at home here. Of course, it has defects, but these are no more marked than those of any other variety. Manchester (old) is planted here for a late crop and were it not for rust and blight—its main troubles—it would be held to eclipse all others for a late berry. I could mention many more, but I consider these the leading new and old varieties for my locality, all the rest being so deficient in some respect that I shall drop them from my list.

RASPBERRIES.—Souhegan for early; Ohio for medium, and Gregg for late are my leading black-caps. Any improvements that have been made on these remain to be ascertained through tests. Nemaha is as large and good as the Gregg, but is no improvement on it, unless it be in hardiness, which as yet remains to be proven with me, this winter having been too moderate thus far for test. Hansell for early and Cuthbert for late in reds are my leading varieties. Marlboro is a failure, and Rancocas not a favorite.

Dauphin Co., Pa.

Farm Topics.

BUCEPHALUS BROWN'S NOTIONS AND IDEAS.

ON MAPLE SUGAR.—We have just been gathering our buckets, after a very good season. It is rather interesting to note the prevailing ideas among consumers about the sugar and sirup they buy, especially those who have never lived in the country, and know nothing about the matter. It seems to be an ineradicable notion, among at least the older purchasers, that the fine, light-colored sugar and sirup have been "extended" with sirup from refined cane sugar, or glucose. They declare that it does *not* have the "good old maple taste," and they "*know* it is adulterated," and it is "*no use* to tell them differently." This must be terribly provoking to our 2,000 to 4,000 tree men, who have been to so much expense to get the nicest apparatus, and are so very particular to protect their sap from contamination or change, from the tree to the finishing off.

BUT LITTLE ADULTERATION.—Undoubtedly the many car-loads of maple sugar sent westward are used in preparing a composite sirup; but among the farmers themselves I have never known of a single case where adulteration has been practiced; and I do not see how there can be any profit in it. The city people, who often pay as high as 25 cents a pound for maple sugar, may wonder at this statement, but when they understand that the average farmer has rarely seen the time when he could get at the stores more than an even exchange of his maple sugar for granulated, they will see that it must be so. Dealers are offering only six cents for tub sugar in our markets to-day.

THE MAPLE TASTE.—What is it? Is it the taste of sugar? No. The nearer sugar comes to absolute purity, the less taste it has, other than pure sweetness. The brown sugars made from cane have a peculiar taste, not the same, but quite as distinct as that from the maple. The maple taste is produced by something in the sugar which is not sugar. Is it an impurity? In a chemical sense it is; but in the ordinary sense it is not. The sap as it runs from the tree, white and clear as it seems, like purest water, is not pure water and sugar. The sap is the tree's blood, and contains dissolved in it, all the substances which go to build up the tree, just as our blood contains the elements of all the tissues of our bodies. It is the presence of these things that are not sugar which give the *pure* maple taste.

THE TRUE IMPURITIES.—Very few people, however, compared with the whole number of those who consume maple sweets, have ever eaten sugar and sirup having *only* the *pure* maple taste. They are accustomed to a sugar which contains many outside impurities, having or causing other flavors, which modify the pure maple taste. These impurities consist, first, of the many things, moss, dead leaves, bark, etc., etc, that fall or blow into the sap in the buckets, and stay there long enough to have some of their flavor dissolved out of them. Besides these outside flavors, there are flavors arising from imperfectly cleaned or sour buckets, from changes in the sap from the admixture of snow or rain water, or from souring, or from being smoked or burned in boiling. All these things together, added to the true maple taste, have had their part in making up a compound flavor which the great majority of consumers, accustomed to more or less badly made sugar and sirup, have come to recognize, and even to demand, as "the good old maple taste." The good old taste is really rather a "woodsy" taste. It is not bad, generally, unless where there has been positive souring which has "inverted" the sugar, and sometimes even disorganized it, so that it will hardly grain at all.

THE "NITER" IN SUGAR.—There is one thing that for a long time was a great mystery in the manufacture of these wild-wood sweets. No matter how great the care taken to bring the sap to the evaporator, when in boiling it reaches a certain degree of concentration, there will often settle out of it a whitish sort of sand, which has the name of "niter." The necessity of getting rid of this sand, to avoid its presence in the finished product, requires that when that certain degree of concentration is reached, the thin sirup must be allowed to cool, and the "niter" to settle out of it before the boiling can be finished. Chemical analysis reveals the fact that it is an organic salt of lime, usually the malate. On land containing lime a portion of that mineral is always dissolved in the water of the soil, making it "hard." It is taken up by the roots, and in the tree assumes this peculiar form, very annoying to sugar makers.

A SUGAR EXCHANGE.—Some of the best makers of maple sweets in Vermont have organized themselves into a company to sell their products under a guarantee of quality and purity. This organization has been quite successful, and the principle admits of being extended to many other farm products. In this way the producer is brought nearer to the consumer, to the manifest advantage of both.

Miscellaneous.

NEW LEGISLATION NEEDED CONCERNING MONOPOLIES.

No. 4.

PRESIDENT W. I. CHAMBERLAIN.

RAILWAY MONOPOLIES FURTHER CONSIDERED.—In addition to what was said in the last number in regard to railways, I add that since railways are virtual monopolies for their "suction range," and since they are public servants invested with a most valuable public franchise, their rights of way, therefore the Government, acting for society, has a triple right to control them in the interests of society: first the general right of self-preservation; second the right and duty to control all monopolies; and, third, the right to control common carriers that use the Nation's highways. It is the duty of the Government to see that the railways meet the wants of the people and do not over-meet them. No more railways should be chartered than "the traffic will bear," to use their favorite phrase. Many years' experience has shown about how many common *roads and streets* are needed in country and in city for the accommodation of the public. In the level, fertile West, roads are placed on most of the section lines, that is a mile apart in both directions at right angles. All lands are sold subject to such legal highways and the property or land pays for working the roads.

In modern cities on fairly level ground there are 10 or 12 streets to the linear mile in both directions, and the property pays for the pavements according either to value or frontages. Too many roads and streets would cost too much land, and too much expense for working. Too few streets will not accommodate the traffic. Long experience has pointed out the golden mean. But railroads are a somewhat recent invention. Experience has not yet had time to determine just how many are needed in any locality. Existing corporations have been eager to push their lines and branches as feeders to their main trunks, out into new territory sparsely settled, far in advance of the needs of population and commerce and of paying traffic, lest some rival corporation should occupy the territory ahead of them. Thus parallel lines are multiplied beyond the demands of commerce, and pooling or purchase follows and the traffic must pay dividends on twice the needed outlay. At last experience would seem to be sufficient to show our legislators at least the need of caution in granting charters. Each company that asks a charter to build a new road or extend one already existing, should be required to show its right to exist, that is, to show that the new line is needed. Then all existing lines and all new ones chartered, should have their schedules of passenger and freight rates determined by law, and made uniform to all and without possibility of sudden change. We shall soon reach just legislation with our present increasing experience, if we are determined to succeed.

OTHER PUBLIC-FRANCHISE MONOPOLIES.—The same general principles apply also to ferry, turnpike, horse-car, cable, motor, gas, electric light, and telegraph and telephone companies and the like, where private capital combined into companies is given right of way through public streets or otherwise, and partial or complete monopoly of serving the public over a given area with reference to some necessity or urgent convenience. For, such monopoly gives the company the power to levy a personal tax within the given area, and unless such power is regulated by the government of city, State or nation as the case may be, in the interests and for the protection of the people, we at once have taxation without representation, the very thing our Revolutionary War was fought to resist.

Now, this power to tax the public without sufficient control as to cost and quality of service, is eagerly sought in cities by carrying and lighting companies and the like, and has become a fruitful source of the worst corruption in securing from city councils long-time charters to the enrichment of the companies and not to the best interests of the people. All such corporations that have right of way and virtual monopoly given them, usually free, through public streets, or sold them on compulsion and appraisal through private lands, get thereby public franchises of vast money-coining power, which become sources of oppression unless properly restricted by statute-law or in the charters themselves. Such companies should be compelled to use their franchises not to heap up inordinate wealth for themselves by small extortions from large numbers, but to serve the public faithfully, reasonably and well; merely taking to themselves fair and liberal compensation for capital, skill and enterprise involved. To this the public does not and should not object. To extortion, like what we have often suffered in the past and are still suffering, the public has a right to object, and a duty to remedy it.

I call renewed attention to a fact mentioned in the first paper of this series, a fact of great importance and wide application, and yet seldom stated and little understood, viz., that notably within the last fifty years our legislation with tardy step has lagged far behind the amazing growth of population, and the still more amazing increase of inventive genius and of material wealth in this wonderful Nineteenth century. In the points now under consideration our legislation, national, State and municipal, seems to be furthest behind The companies have been keener-sighted than the bulk of the people. Beyond all question, the charters given in the past to our great public carrying, lighting and communicating companies and the like, have, through ignorance, short-sightedness and the like been far too libera and too loose to secure to the people their just rights. These companies furnish the great arteries of commerce. The circulation must be kept unrestricted, or commerce will languish. The idea must be dinned into the inner consciousness of our legislators and city fathers that these great carrying, lighting and communicating corporations are given their public franchises and virtual monopolies *to serve the public* and not to *enrich themselves inordinately*. On no other ground has government a right to bestow these franchises Any other ground would mean the favoring and enrichment of the few to the damage of the many, a thing abhorrent to the very idea of all just government, and especially of our own.

RURAL SPECIAL REPORTS.

Pennsylvania.

ERIE, Erie County.—In this city we have two half days each week as market days. On the principal street, benches are placed upon one side. These are used as stands or, as some term them, stalls by the farmers, or hucksters, on which to display their produce, etc. Each one occupying a stand pays a tax of 15 cents, and he can occupy it from sunrise until mid-day. On any comfortable day one can find almost any kind of vegetables as well as seed grains, eggs, poultry, beef, mutton, lamb, pork in all its different forms, and also pigs, live fowls of every imaginable strain; fruits of all kinds, nuts, as well as tropical fruits. The latter business is controlled largely by the Italians. There is a large supply of butter and cheese—with a liberal spattering of Limberger, and a cheese by the German hucksters called Swiss cheese, and by others Illinois Limberger. Its peculiarity is that it is very rich and quite strong without the disagreeable odor of genuine Limberger cheese. Speaking candidly of the butter, I must say I have not tasted a prime article since I came to the city in November. It has a taste so different from anything I ever experienced that I am at a loss where to place the fault. There is much offered that one might say is flavored, the taste is so peculiar. Some has been sold that should have been confiscated by the health officers. A cry is soon raised if "bob veal" is found upon the market; but even that is more wholesome than some of the grease called butter. As a rule, the cheese is superior to the butter. The beef generally has been fair for the kind produced by farmers from dry cows, bulls and stags. It is seldom one sees first-quality young beef on the market. The mutton is usually good; some of it indeed is very fine, if really fat mutton can be called fine. The prices for beef have ranged from five to seven cents per pound per quarter. Mutton about six cents per pound by the carcass. Pork has been good—some extra-fine—price six cents. Turkeys have been in excess, and usually brought 10 to 12 cents undrawn. Fowls are, in general, rather poor; but command 10 and 12 cents. Apples have been very poor, many not being fit for cider, being gnarly, wormy and really inferior in every way. The great surprise to me is the marked ignorance of names of varieties. I have seen the Rambo offered as Baldwin; the Swaar, as New England Pippin, etc., etc. Many a common fruit gets the name of some one of our choicest varieties.

Garden vegetables have usually been fine—onions predominating. The sandy soil if properly fertilized, produces these in their perfection. Erie is the center for onion sets. They are of a superior quality this year, and within the reach of all—they are selling for $2 and $2.50 a bushel of 36 pounds. Fine table onions are worth 40 cents a bushel. Celery has all been very inferior. Potatoes command 40 cents; apples 40 to 50 cents; butter 25 and 28 cents; hay is in abundance at $12 to $16. For the last two market days many flowers have been offered, both cut and in pots.

The city can boast a horticultural society with quite a large membership, with the usual attendance of six to eight members. The discussions are able and well timed. In and around Erie one will see some good horses, many serviceable ones, and a few that might be termed by fair judges, stylish drivers; but nothing very marked as fancy steppers for style or speed. There may be some in private stables, that are not seen on the streets. I have watched closely but failed to see more than one or two that I would care to purchase at anything like a fancy price. My attention has been called to the German prunes that are largely grown in this vicinity. Wm. Lasch is advertising them largely, and claims to import them to quite a considerable extent. I am creditably informed that he has not imported one tree in five or more years—if he ever did. It is a known fact that he has repeatedly gone to Fairview, Pa., and bought the sprouts that had come up in an old orchard there, paying six cents each for them, and sold them on a warranty as imported German prunes for 75 cents each. This variety has a marked advantage over the plum, as the skin is so much more tough that they are less liable to be stung by the curculio. Grapes will soon supersede the apple along the ridge, while the apple will be the standard fruit back on the second and third slopes. The markets here require a different management. The hucksters and farmers should be educated to understand that the market demands the best, and is willing to pay for it; therefore they should try to excel in its production. Good goods always find ready purchasers at remunerative prices. H. A. W.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

CULTIVATING STRAWBERRIES.

J. S., Plainfield, Ind.—I would like to hear again from Mr. J. M. Smith, the great strawberry raiser of Wisconsin. He says he lets the runners run out like the spokes of a wheel; how does he cultivate them? I don't see how he can use a horse after the vines begin to run. Does he cut off the second runners?

ANSWERED BY J. M. SMITH.

It is not often that I recommend to others, except in towns and cities, to follow closely my own plan in cultivating vines and training runners. My land is worth many hundreds of dollars per acre. I can always hire all the help I need at a reasonable price. Hence it is better for me to go to a much heavier expense in obtaining a crop, and then rely upon very large crops for my profits. Now for my methods of preparation and cultivation: First, I make my land very rich with manures from my compost heap, or common stable manures, or both, putting on at the rate of about 40 good two-horse loads per acre. I make sure that the land is thoroughly drained, either underdrained or surface drained, or both. It is carefully plowed and put in as good condition in every way as I know how to put it. Thus far, I claim that those who wish to be successful, should all pursue the same course. Hereafter we may differ in our methods of treatment. I grow the Wilson principally. Wilsons are not such strong runners as some of the other varieties, and will bear setting closer together. I set mine two feet apart each way. I set them in the spring, and do not allow them to bear any fruit the first season, preferring to keep the entire growth of the plant and its runners in a course of preparation for the next season's crop. Do you ask, "What! give the land for two years for a single crop of berries?" By no means. As soon as the beds are set, we plant or sow some quick-growing crop between the rows. Sometimes the Tom Thumb, or other varieties of dwarf peas, or early bush beans; perhaps a crop of radishes or lettuce, or, possibly, all of these and some others are planted or sown between the rows. This, of course, reduces the distance to one foot between the rows, only one way at that. Cultivation with horse and cultivator is out of the question; but we do cultivate very thoroughly with a hand cultivator, and in and around the plants with hoes. Weeds and grass are kept out no matter what it costs. During July, the crops between the rows are ready to be harvested. As soon as ready, they are taken off clean. By this time the young plants have commenced to throw out runners, though but very few have as yet taken root. The beds are now thoroughly cleaned of every growing thing, except the strawberry plants and their runners. Sometimes we use a horse and cultivator, going through them both ways, and sometimes hand cultivators. At any rate the ground is well and thoroughly cultivated, and then the runners are trained around the parent plant as I have sometimes said, like the spokes in a wagon wheel, the parent plant being the center. In training the runners we simply spread them around the parent plant, and throw sufficient earth upon each to hold it in its place. We generally go through the beds twice in this manner. Of course, there is no more cultivating with a horse and cultivator after this, and if they grow as rapidly as we wish them to do, but very little with the hand cultivators. The object is to have the plants fill the spaces and cover the entire ground. If they do this, all moving of the soil afterward must be done with the common hand hoe. After the ground freezes we cover the beds with marsh hay, putting it on in quantity sufficient to hide the plants from view, and leaving it there until all danger of freezing nights is over, when we take it off and stack it for the following winter. The weeds are cleaned out if any should be left from the last fall. A coat of wood ashes or of fine manure is spread upon the top of the ground among the vines. All the open spaces are hoed over and the earth is left as loose as possible. It is a wonderful protection in seasons of drought, (and we have had three years of drought in succession). We generally go through the crop twice in the spring, before the picking season begins. We take only one crop from the beds. As soon as it is off, the vines are turned under, and a crop of fall cabbage or celery is grown upon the ground. This may seem to be very expensive, and is somewhat so; but I am not growing strawberries as a matter of sentiment, but for the money I can get out of the business, and when one can get a yield of 200 or 250 bushels per acre, he can afford to make some extra outlay to obtain such results. My beds have averaged over 200 bushels per acre for a number of years, and I hope to do still better in the future. But how about the beds in the country where land is reasonably cheap, and help almost impossible to obtain? In such cases I advise setting the plants in rows, at least three feet apart if Wilsons, and about 15 inches apart in the rows. If the Crescents or any of the very strong-growing varieties are to be used, I would set the rows four feet apart, and the plants from 15 to 18 inches apart in the rows, and then cultivate just as much as possible with horse and cultivator; but in all cases one must do the work thoroughly and give the plants a fair chance to do their best.

CHRONIC DIARRHŒA IN A MARE.

H. S., Portsmouth, Ohio.—My 10-year-old mare was kept running loose in a box-stall in the stable all winter, with an occasional drive on the road. She had oats and sometimes corn with all the hay she would eat. She was in good condition, but not with foal. About three months ago she began scouring badly. I changed her feed to chopped oats and hay, reducing the amout to about one-third of the winter feed. She always eats and drinks heartily, and appears well. She is in poor flesh, however, and appears weak when driven. A veterinary surgeon attended her for two weeks. He said he dared not check the diarrhœa at once, but gave her some powders and drops in her drinking water. He sent her home three weeks ago, and now the ailment is as bad as ever. What should be done for her?

ANSWERED BY DR. F. L. KILBORNE.

Owing to the various causes and conditions, usually more or less complicated, that may produce this chronic diarrhœa, such cases cannot be satisfactorily treated through cor-

respondence. A personal examination and a course of treatment that is varied according to circumstances are usually necessary. Examine the teeth to see that none are decayed or overgrown so as to hinder mastication. If such is the case they should be drawn or filed. Give two table-spoonfuls of the following powder in the feed twice daily:—Powdered gentian, ginger and sodium carbonate each one-half pound; nux vomica one-fourth of a pound. Also give one ounce of sweet spirits of niter three times daily in the drinking water or as a drench in one-half pint of cold water. Allow only one-half bucketful of drinking water three times daily. Continue the chopped hay and oats in moderate quantity only, and scald well with boiling water or steam before feeding. A little well boiled starch gruel can be given in the drinking water with advantage. Allow only walking exercise until relieved. Rub the belly once daily with the following liniment:—One ounce each of Castile soap and camphor gum dissolved in one pint of spirit; then add one pint each of strong aqua ammonia and olive oil well shaken together. Make sure that the feed is free from mold, must or dust, and that the drinking water is wholesome.

WEAK OR WATERY EYES IN A HORSE.

L. L., Gallatin, North Dakota.—My 11-year-old horse has been allowed to run out on the prairie on fine days, the sun being bright and the snow glaring. After a time his eyes began to water and soon afterwards he couldn't look at the light and acted like a snow blind person. Such fits now last about a day and for the next two days he is all right, but looks heavy. The eye-balls are bright, but the eyes are quite hot. Nothing but clear water runs from them; but he appears to suffer considerably. Otherwise he is in good condition. What should be the treatment?

ANSWERED BY DR. F. L. KILBORNE.

The watery eyes may be due to a cold, a dark or damp stable, to irritating gases in the stable such as arise from accumulating dung and urine, or they may be due mainly to the bright, dazzling light from the snow, in which case the eyes are probably naturally a little weak. Without knowing the character of the stable and the conditions under which the horse is kept, we cannot give a definite opinion as to the cause of the weakness. In any case this bright light from the snow irritates the eyes while in their present condition, so that the horse should not be out on the snow in the sunshine. Protect the horse from exposure to cold or wet. The stable should be dry, clean, airy, and moderately light; but the windows, or doors if open, should be at his back so that he receives the light from behind, instead of directly in front. Keep him in-doors during the middle of the day when the sun is bright, especially while there is snow on the ground. Internally it would be well to give seven drams of the best aloes with one ounce of ginger as a drench in one pint of water, to open the bowels. Repeat the dose in 36 hours, if no effect is produced by the first. Then for a few days give one table-spoonful of pulverized nitrate of potash on the feed twice daily. If the horse is fat, reduce the feed for a time. If the eyes continue to run, keep them covered with a cloth wet with a solution of one-half dram lead acetate and 10 grains of morphia in one pint of water.

BLIND STAGGERS AND RUPTURE IN A HORSE.

C. B., Hartford, Ohio.—1. What should be the treatment for blind staggers in a horse? 2. Can anything be done for rupture in a horse?

ANSWERED BY DR. F. L. KILBORNE.

1. Keep the horse on a bran mash diet for 24 hours; then give six to eight drams (according to the size of horse) of the best aloes with one ounce of ginger, as a drench, in one pint of water, to open the bowels. Continue the mash diet until the bowels are freely moved. Repeat the aloes in 36 hours if no effect is produced by the first dose. As a tonic, give two table-spoonfuls of the following powders in the feed night and morning: Sulphate of iron one-fourth of a pound, powdered gentian, nitrate of potash and sulphate of soda each one pound, mix. Continue the powders for a week and then omit a week; alternate thus for several weeks. A laxative diet should be given so as to keep the bowels open. If the fæces become dry or firm another dose of aloes should be given, as advised above. During the summer feed largely on grass or other green food, and in winter on roots and mashes. 2. Rupture and hernia occur at several points and special treatment is usually demanded for each. You should have mentioned the place and extent of the rupture if you desired us to give specific treatment In general, for the treatment of a rupture, the horse is to be placed on his back, or in such position as will bring the rupture uppermost. The protruding organ is then to be carefully returned, and the opening covered with a pad and bandage, applied so as to prevent the return of the organ through the rupture. The bandage must be kept on until the opening or rupture has healed.

STRAWBERRY CULTURE.

J. J. P., Warsaw, Ky.—Could the following mode of making a strawberry bed be improved upon? Turn over an old clover sod in the fall, and sow on it, in early winter, 100 bushels of unleached wood ashes per acre. In spring go over the ground with a cultivator mixing the ashes with three or four inches of the surface soil. Then sow 1,000 pounds of pure ground bone meal per acre, and harrow thoroughly. Lay off rows three feet by two feet, and cultivate both ways until the runners start, and allow them to mat the narrow way not more than four to six inches wide and not very thick in the row. Would it be well to cultivate the sod one season in some such hoed crop as potatoes or tobacco, before setting the strawberries, on account of the presence of white grubs in the soil, or should the fruit be set out the first season? Is the humus in a clover sod just as good as that contained in stable manure? If so, I will take clover, bone and ashes every time for growing small fruits. My objection to stable manure is that it contains foul weed seeds, and an excess of ammonia for fruit.

ANS.—Our friend's first plan is, in our opinion, the better, and as good as any. We should not sow the unleached ashes before mid-winter or a little later. We should (for his climate) turn under the clover sod in the fall, and not put it in any hoed crop for a season. The humus in the clover sod is just as good as that in manure and more available, in so far as we are informed.

STOPPAGE OF MILK.

H. D. P., Fond du Lac, Wis.—What shall I do for my cows? One was all right 10 weeks ago when she was dried off; but when she came in no milk could be got from one quarter though there was no swelling or obstruction in the teat. Another cow was all right when dried off, but when she became fresh no milk could be got except from one-quarter. Here too there was neither swelling nor inflammation. A little lump the size of a small pea in the teats appears to prevent the milk from coming down. All the cows have been properly milked and handled. I tried to pass a knitting-needle through the obstruction in the teat, but could not penetrate it, as it seems to be a bony or gristly substance; neither could I push it up. It is quite long in some cases. I have handled a large dairy for 30 years; but do not know what to do now?

ANS.—If no milk is secreted in the affected quarter of the udder, there is no satisfactory treatment. But if the milk is secreted as usual, and is prevented from being drawn by some obstruction in the teat, a surgical operation will be necessary to remove that obstruction. In that case we would advise employing the best veterinary surgeon at hand to examine the cows, and open the duct if practicable. Are you sure there was no inflammation or caking of the udder in these cases, after you stopped milking, from being "dried off" too quickly?

AN AILING MARE.

W. J. G., Columbus, Ohio.—A mare has been ailing nearly all the winter. The trouble affected her eyes only at first; but lately her right hind leg has been swollen. The trouble with the eyes was pronounced catarrh, and that in the leg is said to be scratches. She has had good care all winter, and is in a fleshy condition. What should be done for her?

ANS.—Give six drams of best aloes with one ounce of ginger, as a drench, in one pint of water to open the bowels. Repeat the dose in 36 hours if the bowels are not freely purged. Then give one table-spoonful of the following powder in the feed night and morning: Nitrate of potash one pound, chlorate of potash four ounces. If the swollen leg is cracked or sore apply a daily dressing of benzoated oxide of zinc. Reduce the feed and give no corn, buckwheat or other heating foods. Give moderate exercise daily. If the eyes are watery or weak, see treatment for the same in back numbers of the RURAL.

KAFFIR CORN, ETC.

H. S. B., Rome, N. Y.—1. Kaffir corn is being widely advertised as a superior food for poultry so far as the grain is concerned; while the stalks are reported to make feed, green or cured. What does the RURAL say? 2. Where can "seed" of the Early White Ohio be obtained? Is it a good potato for general cultivation?

ANS.—1. Kaffir corn is a variety of sorghum that seeds freely. As green or cured food, Indian corn or other kinds of sorghum are more valuable. From having raised it a single season at the Rural Grounds, we cannot recommend it. It may be planted the same as corn except that the land should be clean. The little plants are slow to start; they look like grass and are readily concealed by weeds. 2. Of T. C. Davenport, 124 Dock St., Philadelphia, Pa. All that we know of it is favorable to the variety. Our friend is referred to the R. N.-Y.'s report.

WEAKNESS IN LAMBS.

W. S. H., (no address).—My lambs come all right, get up and suck, but die within 24 to 36 hours—some of them with scours. The 25 ewes are in good condition; they have not had much grain; but all the hay they wanted. Some brine from meat pickled a year ago was put on some hay the sheep ate three weeks before they commenced to drop the lambs; could this cause the death of the lambs?

ANS.—The lambs probably die because constitutionally weak, which may be due to want of exercise, too close confinement, or to the ewes being too fat. Either cause not infrequently produces weak lambs. Give the ewes more exercise, and if fat reduce their feed. If the brine produced no effect on the ewes, it is probably not responsible for the death of the lambs.

ABSCESS IN THE BELLY OF A COW.

J. T., Gallupville, N. Y.—One of my Holstein cows had a very hard lump in the navel. I lanced it, some matter escaped, and the swelling disappeared. Another has come, however, in front of the udder. On lancing that, about a pint of matter came from it. It didn't disappear and now it seems swelling up again. With this exception the animal is in fine condition. What should be done for her?

ANS.—If the present swelling is an abscess similar to the other, it should be freely opened and washed out with a five-per-cent. solution of carbolic acid. Then carefully wash out daily with a two-per-cent. solution until healed. The opening must be prevented from closing, to allow free drainage, while the cavity heals from above downward.

STERILITY IN A HEIFER.

E. H. C., Oberlin, Ohio.—A Jersey heifer of mine only one year old has been in heat about every 25 days since she was three months old. I didn't like to breed her so young; but she gave so much trouble that I finally bred her to a Jersey bull of her own age. He seemed to serve her well, but in 25 days she was in heat again. Since then I have bred her to the same bull three times; but still she comes in heat regularly every 25 days. What can be done?

ANS.—Try breeding the heifer to another bull, preferably a grade. If this fails, use a vigorous "scrub" bull. If this does not succeed, we can only advise you to employ a competent veterinary surgeon to make a personal examination of the heifer.

THE CATALPA.

C. J. J., Sparta, Mich.—Is the catalpa a foliaceous or coniferous tree, and where can the seed be obtained? When should it be sown?

ANS.—There are two catalpas—the Common and Hardy. There is also Kæmpfer's catalpa and a hybrid variety. Probably you will prefer the Hardy or Catalpa speciosa. Seeds of this may be purchased of J. M. Thorburn & Co., N. Y. for 25 cents per ounce. The seeds may be sown now. They germinate readily. It is a deciduous tree bearing seed pods (fruits) nearly a foot long and less than an inch in diameter.

AMAUROSIS IN A MARE DUE TO PREGNANCY.

G., Virgil, Kan.—My nine-year-old mare has had four colts, and she is now with colt. She has become nearly blind. Is she likely to become entirely blind; or is there any remedy?

ANS.—The blindness is evidently the result of a temporary paralysis of the nerves of sight, causing amaurosis of the eye, due to pregnancy. The disease is of rare occurrence, but a few similar instances are recorded. There is no treatment except to cease breeding the mare.

Miscellaneous.

T. B., Pittsford, N. Y.—Dr. Hoskins in a late RURAL speaks of "sugar pumpkins"; where can I get the seed?

ANS.—Sugar pumpkin seed is sold by all seedsmen.

T. W. M., Rock Dell.—The Orange Judd Company will furnish a book on bean culture. For seed beans write to N. B. Keeney & Son, Le Roy, N. Y. This firm makes a specialty of beans of the finest varieties.

W. P. F., Ithaca, N. Y.—What does the RURAL know about the Morris or Maurice Amber wheat sent out by the Government about four years ago?

ANS.—The R. N.-Y. has not raised it.

E. W. S., Barnesville, Ohio.—Would it pay to sow Alfalfa on ground under raspberries, that will be dug up after fruiting?

ANS.—The R. N.-Y.'s impression is that Alfalfa sown at that time will usually fail.

C. C. P., Brooklyn, N. Y.—1. What about the August Giant black grape? 2. Of the following, which is the best white grape—Empire State, Lady, Lady Washington, Pocklington, Niagara and Hayes? Quality is the most important feature next to hardiness and prolificacy.

ANS.—1. The R. N.-Y. has had no experience with the August Giant. 2. It is hard to say. We should choose Hayes. Lady Washington is too late and not hardy.

C. A. W., Hay Springs, Neb.—1. Chemical compounds are advertised which if applied to the horns of young calves, will prevent the growth of the horns. Would something of this kind be safe and reliable? 2. Are Red Polled cattle considered better for dairy purposes than for beef, and how do they rank with other breeds?

ANS.—1. We have never had any experience with such compounds. The practice has been quite extensively advertised and we learn of a number of farmers who are experimenting with it. 2. Yes. The Red Polls thus far sent to this country have been mainly praised for their dairy qualities, though all admit that they make excellent beef. It is for the somewhat uncertain title of best "general-purpose" cow that they are likely to be boomed.

DISCUSSION.

SCABBY POTATOES.

M. H. W., MOORE'S MILLS, N. Y.—Here are the results of some pretty close observations that I have been making for several years in regard to scabby potatoes. Some suppose scab is caused by grubs or wire-worms. I have very often found those worms eating potatoes, but each kind works in a way of its own, leaving a hole in the tuber, but no scab. The grub eats a roundish hole sometimes the size of a chestnut; while the wire-worm bores directly into the potato as if it was a real wire thrust in. I have often taken hold of the end of one and pulled it out and pulled it in two to make sure of its identity. The holes of these pests do no more harm than the wounds of a potato-fork. I have come to the conclusion that a worm of any family is not a "jack at all trades," but pursues its work in special lines; that just as we find them working 30 or 40 times we shall always find them working. Therefore I dismiss the worm and look in another direction for the cause of scab. In digging a few potatoes every day from the time the tubers are half grown until they are ripe, I find them for some days without spot or blemish. Then, if there is some wet, sultry weather, they will soon be found to have very small spots of a whitish mold hardly to be seen at first, but growing in area and distinctness from day to day. This mold or vegetable growth sends its roots through the tender skin of the immature potato and to a limited depth into the flesh, destroying the structure as far as the roots go; so that in a short time the spot turns dark and dry. All observers notice that potatoes are more scabby when raised on coarse manure. Why? Because fresh manure is a fruitful source of mold. Some soils yield a larger per cent. of scabby potatoes than others when no manure is used on either, because the one soil has that in it which predisposes to mold. Phosphates are better fertilizers for potatoes than manure, because their chemical action or caustic qualities tend to destroy the spores or seeds of the mold in the ground. If the chemist can prescribe something that will prevent mold, I think we can raise our potatoes smooth.

CANNING GREEN PEAS, ETC.

M. C. A., HOMER, N. Y.—In the RURAL of February 23, T. B. S., Webb's Mills, N. Y., asks how are green peas put up in glass cans. The answer is "Experience in putting up green peas in glass or tin has generally been a failure." I must say that it can be done, because I have put them up now for four years. Last fall I put up three dozen cans and all have kept perfectly. The peas must be nearly fully grown so that they will not shrink in cooking; then fill the cans quite full. Then put the glass covers on so as to prevent any condensed steam from dropping on them from the boiler cover. Place the cans on a frame in the boiler; fill the latter with cold water as full as you can without causing it to boil over the cans. Boil two hours; then take out on a cloth laid on the table and fill

up the cans with boiling water, stirring with a thin stick till the air is all out. Then put on the rubbers and seal tight. Put back into the hot water and boil an hour and a-half. Then remove to the table and tighten every cover, and continue doing this until they are nearly cold and see that they stay tight, and if the cans and rubbers are perfect, I think success is nearly certain. I can string beans in the same way; also corn; but the latter does not shrink so that there is no need of putting any water in. One must put more hot water in the boiler as it boils out while the peas are cooking. Pumpkins can be canned by stewing and sifting the same as peas; then filling the cans full and putting them in a boiler or kettle and heating them long enough to be sure that each can is hot clear through. I have never lost a can since I began to practice this method. Seal the cans tightly before putting them over the fire.

WESTERN FARM MORTGAGES.

H. P. N., NICHOLS, CONN.—I see by a late RURAL there is to be a great panic in Western farm loans within five years. What is to cause this great panic? Are Western farms about to shrink in value more than 50 per cent.? If this is so the sooner Western farmers turn their farms into cash the better for them, and the great loan companies which have hazarded their capital on the safety of Western farm loans are not very wise. It seems to me that many who decry Western loans may have an object. It is very desirable for those East who wish to borrow money to make Western loans appear at a disadvantage, thereby enabling them to borrow from our savings banks and others at five per cent. or less, and, moreover, all money or at least much of it invested at home increases the amount of taxable property, while much invested in the West avoids taxation or becomes invisible. Will he who prophesies an early "panic" prove it and state what facts he has to justify such an opinion.

R N.-Y.—If our friend had carefully noticed what he read he would have seen that it came under the caption "What Others Say," and that it was given merely as the prediction of a New England financier engaged in making loans in various parts of the country. The RURAL is not responsible for the different opinions given in that department nor does it indorse all of them. It merely gives them as matters worthy of consideration. There is, however, little doubt that mortgaging farms has been greatly overdone in many parts of the West.

FASTENINGS FOR COWS IN STABLES.

H. A. W., ERIE, PA.—I think it a barbarous practice to place cattle in stanchions and confine them for any length of time. I have for years found that cattle having a free use of their heads have thriven better on less feed than those confined in stanchions. A strap having a large snap on and buckled around the horns—a rope three feet long fastened to the manger in such a manner that the cattle could not get their feet over it, and on the end a swivel to receive the snap—makes the best fastening I have ever seen. The trouble of fastening is very slight, and this gives the head freedom. This is essential to health and thrift. The less worry the cattle are subjected to, the greater the profit from the feed consumed. In T. B. Terry's article on clover hay in a late RURAL, he failed to tell us just how he cured it. For many years I have found that clover should be cut as soon as it is in full bloom. As soon as it is nicely wilted, put it in cocks of about 100 pounds, and if the weather is fine, leave it until it is well cured and when it is thoroughly dry, draw it to the barn without exposing it to the sun's rays any more than possible. This will give as fine a quality of hay as can be made.

R.N.-Y.—In the Hay Special, to be published in a few weeks, Mr. Terry will tell us all about his plan of curing clover hay.

ROOT-GRAFTS FOR THE APPLES.

I. J. B., TITUSVILLE, N. J.—A great many apple trees are grown by taking seedlings up from the seed-bed or nursery row, and whip or splice-grafting them and then setting them out in the nursery row. It is a practice to make from one to three grafts from each root. The last or tap-root graft will grow thriftily in a nursery one or more years. My experience is that such grafts never make trees of any value in the orchard unless the graft sends out roots. I think the proper way to grow the apple by this mode of grafting is to make only one graft from a seedling stock. With more than two and sometimes with more than one graft the bottom graft will make comparatively few roots, and these go downwards. We have two rows of Baldwin trees, one budded about six inches up from collar of the tree; the other root-grafted. It may be that the soil is better in one row than in the other; but for years there was apparently no difference in growth or crop. The trees have now been 25 years planted and I think the difference in favor of the budded trees is apparent in size.

REMEDY FOR LICE ON CATTLE.

F. W. V., SPRINGFIELD, CANADA.—As many herds of cattle are troubled with lice at this season of the year, I can from personal experience recommend the following remedy: To a gallon of soft water add one pound of soft soap and one pound of washing soda. Bring the mixture to a boil, and when cool enough to allow one to keep the hand in it, saturate the affected animals. It has the advantage of being cleaner than greasing, and it will not loosen the hair, as may be easily done with petroleum. It is also death to sheep ticks.

J. A., VINCENNES, IND.—A short time ago an article in the RURAL denounced the burning of straw as an act of folly. I wonder if the writer ever worked on a straw pile, or whether he ever saw a crop of wheat the straw from which was so abundant that the owner and his hired men, helped by all the neighbors, could not take care of it. Most farmers in this section do save some of their straw, and to condemn a farmer because he is compelled to burn most of it, shows ignorance of farming on a large scale in a section where population is thin and hired help scarce. There are many sections in which the labor required to take proper care of straw is worth more than the straw would be worth for any purpose. As a rule, the practice commonly followed by intelligent farmers in any section is the best under the conditions prevalent there however unwise it may seem to wiseacres in another section where the conditions are entirely different.

W. L. B, FAULKNER, IND.—Perhaps some one would be benefited by learning how to get rid of the common caterpillar. My way is to destroy all the eggs I can find in the fall and winter. When the eggs of the others are hatched, with a bottle of coal oil and a feather or stick having a rag on the end, I go around and dampen the nests and the pests. The latter will be dead by the time they get to the ground. This mode of treatment cleans the limbs off entirely and does no injury as burning and other ways do. I use pyrethrum or insect powder for currant and gooseberry worms. It will also kill cabbage and parsnip worms. I did not take the R.N.-Y. last year, but concluded I could not do without it this year.

W. R. W., WILMINGTON, OHIO.—On page 237 of the RURAL I see an article on the subject of "wearing out seed." I certainly think that the writer is correct in saying: "Intelligence and careful cultivation and the proper selection of seed will keep up any variety, etc." In proof of the truth of this theory I will say that I am raising the old White Neshannock potato still, a variety that had almost become obsolete. Last year on the same kind of ground, and with the same cultivation, I had Early Rose, Burbank and Early Ohio. The Neshannock was by far the most productive. This year I shall plant for late crop only the White and Blue Neshannock.

Horsford's Acid Phosphate,

Makes an Invigorating Drink with water and sugar only. Delicious.—*Adv.*

Miscellaneous Advertising.

Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

$20 FENCE MACHINE FOR $10
Freight paid. *Guaranteed.* Hundreds in use. Circulars free. S. H. Garrett, Mansfield, O.

FEMALE FARMERS.

WILL the coming young woman be a farmer?

Scattered all over the broad prairies of the Northwest are hundreds of self-reliant, true blue young heroines, living in small, isolated cabins called shacks, proving up claims, entering homesteads and making money.

It is lonesome, dreary business, this living alone on a wild, unsettled prairie, without a face or human form to welcome one or cheer one's solitude, but there seem to be a good many young women who have the grit to hang to this solitary life long enough to prove up a claim at least.

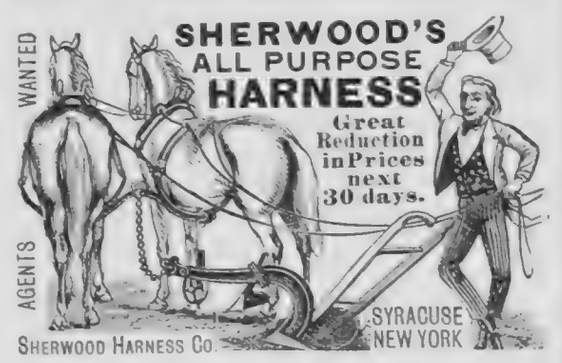
Four young ladies in Dakota last year put their heads together and hit upon an ingenious plan, whereby they could each secure a claim and yet all live comfortably together in one house and each be upon her own land. Instead of building four shacks with one room each, they constructed one shack with four rooms, but so nicely planned that each room of the square building was on a different quarter section. Each had her own bed in her own room and in that way, each claimant at night slept upon her own land.

Society ladies of the city will wonder, not so much how these young lady settlers get along without social privileges, as how they dared live so far away from the doctors. Why, bless you! they never thought of being sick. Doctors are not half so much of a household necessity as city people are in the habit of thinking.

For all the ordinary ills of life, the old-fashioned roots and herbs remedies are more effective, and much safer in results than modern doctors' pills and potions. These latter are so radical in their effects that, while they may better meet the modern desire for quick results, they frequently permanently injure the system, nature rebelling against the unnatural methods employed.

It is always safest to follow natural methods in treating disease. The old-time roots and herbs remedies, which our good old log-cabin grandmothers knew so well how to prepare, were the best medicines the world ever knew, because they were nature's remedies.

The modern world needs them. In Warner's Log Cabin Remedies, and especially such as Warner's Log Cabin Sarsaparilla and Warner's Log Cabin Cough and Consumption Remedy, the people of to-day have an opportunity to secure the healthy medicines which our rugged ancestors used with such splendid results.



IF YOU WANT Best Farm Boiler EVER MADE For Cooking Feed for Stock, Heating Milk or Water in Dairies, Small Cheese Factories; for Bath-Rooms, Laundries, Scalding Hogs, Etc., address J. K. PURINTON & CO., Des Moines, Iowa.

FREDERICK T. ROBERTS, M. D., Professor in University College, London, Eng., Examiner in Medicines, Royal College of Surgeons, says in reference to advanced kidney disease: "Complications are met, such as consumption, heart disease, morbid conditions, liver affections. Warner's Safe Cure cures these affections by putting the kidneys in a healthy condition, thereby enabling them to expel the waste or poisonous matter from the system."

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, APRIL 27, 1889.

FRIENDS and patrons of the R. N.-Y., are respectfully notified that our trial potato ground is full.

"If the chemist can prescribe something that will prevent mold, I think we can raise our potatoes smooth."—M. H. W., page 282.

Two "Women's Contest" plots have been planted at the Rural Grounds, both according to the R. N.-Y.'s Trench system. The first was planted to the No. 2 (100 pieces), No. 3 (50 pieces), No. 4 (100 pieces) and Brownell's Winner 113 pieces, making 363 in all—the area being one fortieth of an acre. The other plot was planted to the No. 2.

"I have for years found that cattle having a free use of their heads have thriven better on less feed than those confined in stanchions."—H. A. W., page 283.

YOU have a given amount of good seed and manure. You are able to perform a given amount of work. This, we may say, is the capital for your farm operations this year. Now, then, the question is:—Will you make more money by spreading that seed, manure and labor over 20 acres than you will by condensing it on 10 acres? Take any multiple of these figures and apply the problem to any farm in the country. The way this question is settled will have very much to do with the profit or loss on many a farm where profit means contentment and peace, and loss means desperation and worry. Think it over.

It is going to pay you to read every word of the story, "Our First Farmers' Institute," which begins this week. It's sound, sensible and truthful. Read it and think it over.

LOTS of so-called "dairy authorities" are urging farmers to go into winter dairying. Make arrangements, they say, to have the cows calve in September or October so that their milk flow will be heaviest when butter and cream are highest in price. A good deal of such talk is given without any limitation whatever. Now, in many places near New York, and also in the vicinity of summer boarding-houses, cream and milk are highest in price in summer, when summer boarders and city visitors are on hand. Thus we see that the man who gives such general advice, without any qualifications, is an unsafe guide. We also see that the way to get the most out of the cream and butter is to know when either will bring most and then make it. The only way to know is to investigate and think.

"The idea must be dinned into the inner consciousness of our legislators and city fathers that these great carrying, lighting and communicating corporations are given their public franchises and virtual monopolies to serve the public and not to enrich themselves inordinately."—W. I. CHAMBERLAIN, page 281.

NEW YORK CITY now receives a great many horses from the Northwest. In former years the lumber camps were able to use the surplus of good horses raised in that section. Of late years horse breeding has been developed to such an extent that the camps cannot utilize all. Thus some fine animals are sent East. The Northwest is not a corn country. Horses there get more oats and wheat bran for grain feed. One would suppose that such feed would develop tougher and more serviceable animals than the corn of the Middle West. Such seems to be the fact. While these Northern horses are not so heavy and fat as those raised further south, they are tough, wiry and solid, and are greatly liked for street work. As a rule, however, they are poorly broken. More care should be taken about breaking them before they are shipped East.

"A man must use his brains if he wants to succeed with a machine. A harrow or a weeder run over a piece of corn or potatoes on a hot, dry, sunny day at the proper time, will kill all the weeds; but if used on a wet day or after the weeds are up it is worse than useless."—L. W. CURTIS, page 278.

NO KIND of legislation more deeply concerns the farmer than that designed to protect him from railroad discrimination. One of the worst offenders in this line is the Pennsylvania Railroad, whose policy has greatly contributed to reduce the value of produce and land in many wide sections of the State. While other industries have been plundered through the favoritism and corruption of railroad managers, beyond all doubt agriculture has been the greatest sufferer. Some time ago the Grangers appointed a Legislative Committee of six, whose duty it was to push legislation in the interests of farmers at Harrisburg. There is a bill now before the legislature against railroad discrimination, and it is charged that at least three of the Granger Committee have for upwards of a month been strenuously obstructing its passage. Would it not be well for the Grange to investigate this matter?

"If the value of the smoothing harrow were properly understood and if it were more used by the Southern farmers, it would save m ons y clearing and cultivating the young crops at the busiest season of the year. In such times a good team and harrow used at the proper time would do more work in one day than six plows and ten horses could do in the same time."—J. C. STRIBLING, page 279.

FOR years the root crop has been a staple product of English farming. For generations English farmers have been taught to believe that it is impossible to raise good stock without roots. Times change. New conditions twist practices all about. Even now good English farmers are seriously considering the profit of continued root culture. It has been clearly shown that the cost of the crop has steadily increased from year to year. The silo has provided the friends of silage with a series of remarkable figures on the cost of cattle food. It is not at all probable that the English root crop will become a memory, but it is clearly certain that it will be lessened. The point we wish to make is that you may have been conducting unprofitable farm operations for years simply because they have always been found in your neighborhood. A little careful experiment and study might show you clearly that they are unprofitable. Now is a good time to think of such things.

"Some farmers harrow corn land immediately after plowing, plant, then roll, and harrow over once or twice more. This leaves the land in fine condition for the cultivator; but should a heavy, beating rain follow soon after, the soil will pack almost as solid as a road, and it must be stirred again by some means before it bakes, or there will be tribulation."—FRED GRUNDY, page 278.

A FRIEND of the R. N.-Y., a good business man, born on a farm and well acquainted with agricultural methods, recently made a visit to the Rural Grounds. On the way from the station, a large, fine-looking farm-house was passed.

"That's a good farm-house; how large a farm does that represent?" said our friend.

"Sixteen acres of cultivated land! That farm supports two families. The girls have a piano, the family take plenty of time for holidays and visiting, and a little money is saved every year."

Our friend shrugged his shoulders. "That beats me; I couldn't do it; I thought I could learn how to handle almost any business, but I wouldn't attempt that." The man who makes "farming pay" will be found working on solid business principles and there are surprisingly few men who excel in other lines of business who could take up agriculture without previous training and make anything like a success of it.

"Harrowing potatoes is not practiced by any of the large growers of this locality. For first cultivation nearly all have adopted the method of covering the entire surface of the row, the young plants included, soon after making their appearance, the soil for the purpose being moved from between the rows."—I. D. COOK, page 278.

THAT is a new path of usefulness started by the Vanderbilt University, in Tennessee. It offers to give full instruction in road making and engineering to one highway official from each county in the State. The course of instruction is to consist of "lectures and practical work on the economical location of highways to conform to the conditions of topography and traffic; principles of the construction of new and the reconstruction of old roads, and of maintenance and repair; methods of drainage; simple highway structures; retaining walls; drains, culverts, simple bridges; a study of the system of highway administration, etc. The roads of Tennessee are as bad as those of any State in the Union, so that this plan is likely to be of great advantage to the farmers of the State, whose welfare is most deeply dependent on the condition of the roads. Isn't the example worth following by institutions of learning in other States also? If they cannot afford to give roadmasters gratuitous instruction, would it be well to make to the State an offer of such services on favorable terms?

AS OUR readers are aware, potash salts contain a very important fertilizer material. Under the law all foreign substances used for fertilizing purposos are admitted free of duty. In 1870, however, the Treasury officials discovered that potash salts of a high degree of purity were imported by certain persons, under this law, while they were really used for the manufacture of chemicals. Accordingly the Secretary of the Treasury decided that any so-called manurial salts or fertilizers containing 30 per cent. of free potash or over, should be subject to duty. This ruling has ever since been a source of no inconsiderable loss to farmers on account of the consequent increase in price of Stassfurt salts which contain a high percentage of potash. Secretary Rusk has been investigating the matter, and has learnt from the Treasury Department that the decision was made solely to prevent fraud, and that the Department was ready to admit such salts duty-free, provided assurance could be obtained that they would be really used for fertilizing purposes. It is suggested that the manufacturers of fertilizers, who are the chief importers of these products, should give bonds to the Treasury that all such salts they may import shall be used exclusively for fertilizing purposes. The suggestion is likely to be adopted, in which event there should be a considerable decrease in the prices of potash fertilizers.

ADDITIONAL NAMES.

THE following names should be added to the list of contestants in the Women's Potato Contest.

Miss Jennie Sullivan, Bergen County, N. J.

Miss Nellie Stillman, Alleghany County, N. Y.

Mrs. M. Crawford, Cuyahoga County, Ohio.

Mrs. T. H. Hurst, Cuyahoga County, Ohio.

Nancy J. Neff, Belmont County, Ohio.

Mrs. E. M. Mehan, Beaver County, Pa.

Mrs. Susan P. Fowler, Cumberland County, N. J.

TIPS IN PLACE.

WHEN we consider that tips for horses are only about half the weight and cost of full-sized shoes, and that in certain circumstances they are much better and safer, it is surprising that they are not getting more rapidly into use. They never contract the hoof, but keep it in a natural healthy shape, and allow the frog of the foot to be planted squarely on the ground, and thus lessen the jar to the leg joints, and their liability to be injured, besides giving a firmer grasp on slippery ground. The surface of the hoof to which the tip is to be nailed should be pared down enough to make it level with the hind part, so that it will set flat alike from toe to heel when the the horse is stepping on the ground, or standing on the stable floor.

THE GOLDEN BELL.

THE Golden Bell may fairly be called the queen of early-blooming shrubs. It is about the earliest to bloom. It is extremely hardy. It is of exceptionally vigorous growth and long-lived. It blooms from top to bottom, and it blooms *every* spring. Confined to a single stem it forms in three or four years a beautiful little tree

Forsythia viridissima is the species seen in every garden. F. Fortunei is of comparatively recent introduction and in several important respects is superior to the first named. The flowers are larger; it is of more vigorous growth and blooms some two or three days earlier. The leaves are larger, the branches stronger and it is quicker to form a shrub of mature and ample proportions.

The Golden Bell should be seen in every garden. It is beautiful when covered with its bright yellow, four-petaled flowers which appear before the leaves; beautiful for its bright, luxuriant foliage after the flowers have fallen. But of the two, choose by all means Forsythia Fortunei. The genus was named after Mr. Fortune who sent it to us from Japan. The latter bears his name both generically and specifically.

THE RIGHT KIND OF TALK.

THE following extracts are taken from a letter recently sent the R. N.-Y. by Edwin Willits, the new Assistant Secretary of Agriculture. We like such talk:

"I wish most emphatically to say to you that I have not accepted the position of Assistant Secretary of Agriculture because it is a political position, but in spite of it. I want no political position, and this place came to me because the scientific workers and the agricultural college people thought (whether true or not time will demonstrate) that I have qualifications for organizing and conducting in its widest scope the scientific work of the Department, and for bringing it into harmonious relations and co-operation with all the experiment stations of the country. I did not seek the place, had no thought of it, did not know of the movement till my name was ready to be sent to the Senate.

But I have been impressed so fully with the importance of the grand impulse of the day to apply science to agriculture, that if the men associated with me think, as they seem to have done, that I am the man to represent their wants in the Department of Agriculture and to bring it into full sympathy with practical agriculture, I will not decline, though my plans here in the local field are only half developed.

I am to have charge of the scientific work; that is the Secretary's wish. President Harrison told me that I owed my selection to scientific and not political influences, and, so far as I can, I shall try to satisfy the RURAL and all other friends of agriculture that there is a place in the Department for such a man."

"As a rule, the practice commonly followed by intelligent farmers in any section is the best under the conditions prevalent there, however unwise it may seem to wise-acres in another section where the conditions are entirely different."—J. A., page 283.

BREVITIES.

STRAWBERRIES retail at 25 cents per quart.

READ what Uncle Bucephalus says of "the true maple taste."

ARE you reading President Chamberlain's forcible monopoly articles?

MR. J. M. SMITH tells, in answer to a question, how he treats his strawberries.

FARMERS in Western New York are evaporating apples—not this year's crop, however.

THE R. N.-Y. would be glad to know where it can procure a plant or so of the Austrian Copper rose.

FOR the first year in the R. N.-Y.'s experience, the white-blackberry canes came through the winter without much injury.

MOTHERS and daughters, read what Miss Taplin has to say in her "Chat by the Way." It is good, sound advice from a good woman.

IN the R. N.-Y.'s field culture of potatoes this season, the trenches are dug by the winged shovel plow run twice to the trench. This gives the desired depth and width.

IT appears that some farmers are making a little money at growing roasting pigs for this market. There is quite a demand for these juicy little fellows. It will pay to work up this market.

THE Cumberland (Triumph) is one of the best strawberries ever tried at the Rural Grounds, as we repeatedly stated years ago when it was introduced. Now it is coming to the front as all the R. N.-Y. ever claimed for it.

WE are giving our asparagus bed a liberal dressing of kainit—probably at the rate of 1,500 pounds to the acre. This furnishes potash and salt, the latter of which is thought to be helpful to asparagus plants, though there is no *evidence* to that effect that we know of. A dressing of sulphate of ammonia at this time would no doubt hasten growth and increase the size of the stalks.

Indust'l Societies.

THE TWENTY-SECOND SESSION OF THE AMERICAN POMOLOGICAL SOCIETY.

(Concluded.)

(R. N.-Y. SHORT-HAND REPORT.)

The White Adriatic fig; the Peen-to and Honey peaches; the Kelsey and Satsuma plums; next biennial meeting to be held in Chicago; gloom in the evenings; visit to some large orange groves; dead-head traveling; nut culture; drawbacks in the meetings.

In continuation of the discussion upon the newer fruits at the last session of the society, figs were next in order. Mr. Peck spoke of the new White Adriatic as doing well. Mr. Pierce said: "It does well on Indian river." The variety was then placed on the list and recommended for trial. Peaches came next. Dr. Hape inquired as to the success of the Peen-to. Mr. Tumblood: "I have grown it successfully, and believe I was among the first to grow it in Florida. The only objection to it with me is that it blooms too early; frost often catches the blossoms. The tree is very vigorous. There are now many seedlings from the Peen-to which are better than the parent in size, shape, and in general. I think a few years more will give us much better varieties, and I have great hopes in that direction. The shape and size of the Peen-to are objectionable. Some of the seedlings already obtained seem to partake of the hardiness of the pear. The Honey does well with me and always escapes the frost. Neither of these varieties is subject to the attack of borers." Mr. Adams: "In South Florida there is very little trouble with the early blooming of the Peen-to." Mr. Callanan: "I now have trees loaded with the Peen-to peach. I have fruited it six or seven years and never lost a crop by early blooming. My trees stand the frost extremely well. I live in the western part of Clay county." Mr. Trowbridge: "I consider it a grand acquisition as a peach in Florida, and I move it be placed on the catalogue and one star be given to it in Florida." This motion prevailed.

Plums were then taken up, the Kelsey being first called. Mr. Callahan: "I have fruited it two years and am well satisfied with it so far. I have great faith in it, having planted an orchard of 6,000 trees, and I expect to plant more. It promises well for Florida. I think it will make a good prune. It stands shipment well. The tree is hardy and grows vigorously."

Satsuma was next called. Mr. Van Deman: "I think well of it. It has the same quality as the Kelsey and is of the same size. It is blood-red inside, and earlier by a month than Kelsey, and I think it is more hardy. It may thus prove more valuable for the North where the Kelsey will not do." The fruit discussion was abruptly closed at this point, the hour for adjournment being so near at hand.

It was then moved by Mr. Trowbridge of Ohio that the next meeting of the society be held at Chicago. This was seconded by Mr. Brackett and many others. Mr. Boon, a member of the Illinois State Society, extended an invitation to that effect and it seemed to be the unanimous desire of all to meet at Chicago next time. Such was the recommendation made but the final decision was left with the Executive Committee. The society then adjourned finally about noon, February 22.

As to the room in which the meetings were held, it should be said the Opera House was well adapted with one exception, and that defect became so annoying in the evenings and the dark cloudy weather as to interfere seriously with the transaction of business. Want of sufficient light was the trouble. There being no gas, a few smoky kerosene lamps had to be relied upon. The spectacle of the chairman holding a heavy lamp that the essayist might see to read a long paper while the reporters were scrawling over their note-books by guess in the dark and the members were sitting in the ghostly gloom peering through the shadows at the speaker on the stage, was in no way cheering to the average northern visitor, but in direct contrast with the real hospitality and enterprise in which the Florida people strove so hard to excel.

In the afternoon the society was taken on an excursion to Citra, where the extensive and beautiful orange groves of the Crescent Orange Co., Bishop Hoyt & Co., and the celebrated Harris grove on Orange lake were visited. The latter contains 200 acres in bearing and is the largest bearing grove in the State; 46,000 boxes of oranges were shipped from it the past year. The trees are all on the native stocks just as they grew, being from 12 to 17 years old. The visitors were given full permission to gather fruit from the trees in all parts of the grove to their hearts' content, there being some 3,000 boxes still on the trees. The other groves visited were 100 and 150 acres in extent respectively, the former yielding 30,000 boxes last season. The packing-houses were also investigated with much interest. On the following day excursion parties started out in various directions to all leading sections and points of interest in the State. Very few of the delegates returned home until a week or 10 days after the close of the meeting, having such an excellent opportunity for traveling all over the State and seeing its wonders and bright winter attractions.

An interesting paper presented but not read before the society was by H. M. Engle, upon "Nut Culture." He thinks thousands of unproductive acres might be made profitable in this way; large supplies of food for man might be obtained with more certainty than by equal amounts of money and labor spent in the production of other crops. If more of the natural products and less of the artificially prepared and adulterated articles were eaten, mankind would be much the better for it. A reliable chemical analysis of the nutritive proportions of edible nuts is needed. Where the chestnut will flourish it may safely be put at the head of the list, since, for quality it is unsurpassed. There is a wide field for hybridization and cross-fertilization in nut culture. Combinations of the best qualities of originals may be brought together in new varieties, and the problem should not be more difficult than for stockmen to breed off horns, increase muscle and reduce bone. The black walnut, butternut, English walnut, pecan, shell-bark and filbert can all be improved in the direction of less shell and more kernel."

In concluding this report of this very successful and pleasant meeting of this society, it seems to the writer, [and to the editors of the R. N.-Y. as well. EDS.] that the essays and papers read were, as usual, too numerous, and many of them were far too long. Too little time was left for discussion. Essays, theories, data and statistics may all be presented in the horticultural press, where fruit-growers may read them at their leisure.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

THIS is the season when people who have overtaxed their digestion during the winter months still further torment that faithful servant by a succession of nostrums. It was the old idea that the system must be thoroughly cleansed every spring, and while there is a certain amount of truth in this idea, it is greatly abused. If the laws of hygiene have been properly observed, care in diet is the only thing needed by adults. Growing children are very often subject to slight blood disorders in the spring, resulting in unsightly eruptions, but in most cases the old-fashioned remedy of sulphur and molasses is both the best and safest to administer, while if it seems a more serious disorder it is best to consult a physician. Of course, as the warmer weather begins people will do well to lessen the amount of heavy food, fried cakes and all sorts of fatty dishes, using fresh fruit or vegetables when procurable. It does not cost very much for a farmer with plenty of good manure to put up a little frame in which to grow early lettuce and radishes, and these vegetables will not only give a zest to the meals, but will also benefit the family health.

* * *

DOES a girl whose first and greatest confidant is her mother ever wreck her life morally? We don't think so—that is to say, unless the mother herself is morally unfit to act as guide. But when a girl begins to keep things from her mother she takes the first downward step. There are so many things in life strange and puzzling to a young girl; so much that she ought to learn and so much of which she ought never to hear. Unfortunately she is apt to hear the things she should leave unlearned, and that from others than her mother. There is no doubt that growing girls gain much knowledge that rubs off the girlish bloom through promiscuous associates, and the careless mother is certainly to blame. The holy innocence of a pure-minded girl is too sacred to be smirched by any coarseness; happy is she who keeps that ignorance of evil to womanhood. She is like the lady in Milton's Comus—no evil thing may harm her.

* * *

As a girl grows toward womanhood there are many things she ought to know concernidg her own nature and organization. Unfortunately, instead of being instructed modestly but sufficiently by a pure-minded and loving mother, she is too often left to pick up such knowledge from outside associates; the result is that the information received is not only often imperfect and erroneous, but it is also coarsened in the telling. She is likely to suffer in consequence both in mind and body.

* * *

WE recently heard a mother say that she thought girls knew a great deal more now than they used to—and more than they ought to, as well. There is no question of this; but it is not entirely the girls' fault. A mother who allows her little girl to roam at large, receiving such impressions as are given by all sorts of associates, cannot wonder if her girl seems pert, bold and forward. We see little and big girls lounging along the streets, laughing and talking loudly, staring and commenting on everything, and then learn that they are the children of respectable and well-to-do parents, who wonder why their girls are not more lady-like in deportment. If we were asked the time-honored question, "What shall we do with our daughters?" our first suggestion would be to keep them at home. It is all very well to make girls self-reliant and able to care for themselves; but self-reliance need not become boldness.

* * *

WE love old-fashioned girls—modest, and innocent, yet self-reliant—real mother's girls, whose innocence does not imply ignorance. Few girls, however, are actually coarse by nature, and the coarse streak may be lessened by training. It is for the mother to attend to that.

* * *

AN innocent and pure-minded girl is usually a little gentlewoman in her manners. And good manners, with good nature, will take one anywhere. This is a free country, as we often assert with much pride, and we may all be gentlewomen in rank, if we choose. Perfect manners must be grounded on good temper, sympathy and unselfishness, and a girl whose daily conduct is an exemplar of these virtues is a thorough gentlewoman, even if she does not understand how to use a finger bowl.

OUTINGS IN NEW ENGLAND.

V.

MARY WAGER-FISHER.

IT must be impossible for any one to step foot in Plymouth without a rush of feelings flooding the heart, raised by the multitude of associations which have consecrated it for all time. More go to Plymouth by steamer from Boston than by rail and in so doing there is something to be gained, as well as money to be saved, in sight-seeing, for the steamer traverses a part of the same course made by the Mayflower, lands the passengers fairly at the foot of Plymouth Rock, and, withal, furnishes a view of the town from the water, which is exceedingly pretty, and of which one of the striking points is Forefathers' Monument. The railroad ends at Plymouth, so that to reach any place by rail, from there, one must retrace his way, for some few miles at least. But the New England coast abounds in what the people call barges, which are long, wide omnibuses, or stages. Until we saw one, however, we labored under the confusion that a barge was a vehicle for water travel only. There were a number in Plymouth, some with regular routes of travel, and others ready to transport parties to almost any point, for a few miles around the country. They are gaily painted, bear some fanciful name, are comfortable to ride in and a decided improvement upon the old-time stage for warm weather travel.

WE had the good fortune to find suitable lodgings in a quiet, well-kept hotel, and the three windows of our airy room overlooked Plymouth Harbor, and far out to seaward. The sunrises were so brilliant that more than once I arose before the edge of the sun was above the horizon and hastily sketched in water-colors the marvelous hues of the sky and water, the long tongue of sand that barred the harbor from the sea, and the black shadows cast by the scattered buildings on it. "Of course, you've exaggerated the coloring, somewhat?" is a frequent interrogative comment on the sketches which were so feebly copied from nature. I heard an artist once say that no one knew how a tree or anything really looked until he had made a drawing of it. One marked difference between this country and other nations is that what in them is looked after by the government, is here the work and care of individuals. So in Plymouth, every spot and relic which is of national interest, has nevertheless been nursed and protected by local care and private munificence, and very little of importance has been allowed to perish through neglect. But this kind of thrift is characteristic of all New England, whose local historians, poets, romancers and artists have made the most possible of their materials, and Longfellow literally wove the entire coast into song.

Forefathers' Day is annually observed in Plymouth by the Pilgrim Society, which dines, presumably, better than did the forefathers. However, as the Pilgrims were so much reduced at one time that five kernels of parched corn were counted out to each one for his meal, so the annual December dinner begins with turned down plates on which are laid five kernels of parched corn. I am sure that I could never get those five grains down my throat without choking with sobs—that first dreadful winter was so terrible! After the corn is despatched a succotash is served made of hulled corn and beans, chicken and corned beef. Our landlady told me that it was a Pilgrim dish, and that the chicken and beef in about equal proportion were boiled together until the meat fell from the bones and could be shredded. Then vegetables cut in dice and the corn are boiled in the water until tender, and the beans, cooked separately and mashed through a colander, thicken the mass. Services are held in the churches. Plymouth Rock, as it now reposes under a granite canopy, has had its history. It is a granite boulder, and in the early history of the country it was in danger of being covered up by the construction of a wharf about it; and an attempt was made in 1775 to raise it, which resulted in splitting off the top part. This detached portion was carried to the town square and deposited at the foot of a liberty pole. In 1834, on a Fourth of July, it was carried with much ceremony—16 pairs of oxen being mustered for the occasion—to Pilgrim Hall, which had been erected in 1824, deposited in front of it, and inclosed by an iron fence. But a few years ago Mr. Stickney of Baltimore, a Massachusetts man by birth, and a member of the Pilgrim Society, with great taste, forethought and liberality, defrayed the expense of improving and embellishing various historical possessions of Plymouth, upon condition that the two pieces of the famous rock should be re-united. So the detached piece was restored, and forms the top which is now exposed above the ground and bears the date 1620. At this time, fragments of the rock were secured by covetous fingers and afterward held for sale at high prices, and even to this day, small bits of rock—claiming to be of this bowlder—are sometimes offered to tourists. But the rock itself is now so secured that immediate access to it is impossible. Anaximander said that when he was at Plymouth several years ago, he had no difficulty in hammering off a piece, and that it must now be lying among some of his collegehood collections, which statement made the laddie's eyes shine with expectation of finding it when going on a grand rummage through the attic in the homestead some rainy day. Near the rock rises Cole's Hill in which the victims of that first terrible winter were buried, and over whose graves corn was planted, to conceal them from the Indians—for half of the little band perished. The bones of some of the dead, have in later years been discovered, and tablets mark the spot. In 1855, while trenches were being dug in a street crossing the hill, parts of five skeletons were found, and these were placed in a metallic box and put in the chamber of the canopy over the rock.

Directly up from Cole's Hill with the harbor at its feet, runs Leyden street, to Burial Hill, back of the town. In going up this oldest street in New England to Burial Hill, one to-day walks under magnificent English elms, planted by the forefathers. One in particular, not far from the Rock, is well worth a journey to Plymouth alone to see. Its branches reach more than across the wide street, and like some of its contemporaries, it has been strengthened in various places with metal bands and clamps, to prevent the great arms from being split off by the wind.

HUSBANDS AND WIVES.

E. S. LINCOLN.

YOU touch a vital point when you call for a Symposium on the subject of the woman's purse. The evil which makes it look proper to men-folks in general that women should be without money and without vote is one that needs thorough probing. It's selfish

—just selfish—thoughtlessness on the one hand, and cowardice on the other. Husband-worship is the modern form of an ancient vice—it is real, sinful idolatry, and does neither the husband nor the wife any good. If the truth—the astounding truth—were known, it would be found there are more *disappointed husbands* in the world than heart-broken wives. And that evil can never be mended until the husband is made to understand what he has or has not the right to expect and ask of his wife.

The wife should be made to know her *chief* duty to her mate is not the silent endurance of thoughtless, custom-justified meanness; but the giving to him of the fullest, most perfectly satisfying sympathy and co-operation in whatever lies nearest his heart—in whatever is most essential to his real wedded happiness. Few women do this, though all would if they knew how, and these few are never beggars to their husbands for justice. They are queens of their homes, and usually feel themselves to be appreciated beyond their deserts. I judge from King Solomon's picture of his ideal wife, mother, and housekeeper, that the needs of men are as unchanging as their natures, and that women who fully satisfy them will always be appreciated. Says one old neighbor of mine, "Well, I was the envy of all my neighbors, for I had $12 a year to spend as I liked." Her husband hired her to do without snuff by the payment of $1 a month pin-money. In view of the fact that his sole capital in life had been her dowry, it did not strike me as great generosity.

GOLDEN GRAINS.

FROM THOREAU: As we grow older, is it not ominous that we have more to write about evening, less about morning. We must associate more with the early hours.....

IF my friend says in his mind, I will *never* see you again, I translate it, of necessity, into *ever*. That is the definition in Love's lexicon. Those we can love we can hate. To others we are indifferent .....

W. W. STORY says: Live not without a friend! The Alpine rock must own its mossy grace, or else be nothing but a stone.....

IT was Thoreau who said: I would rather sit on a pumpkin and have it all to myself than be crowded on a velvet cushion. I would rather ride on earth in an ox cart with a free circulation than go to heaven in the fancy car of an excursion train and breathe a malaria all the way..... .....

Do not do some good thing on purpose that you may be happy. You must do good for the sake of doing good, and not for the sake of the kicking back of happiness.....

"IF you take the right side, the just side, said Seward, ultimately men, however much they oppose you and revile you at first, will come to your support. Earth, with all its power, will work with you and for you, and Heaven is pledged to conduct you to complete success ....

HEAL; do not stab. Of all deadly instruments there is none that carries so bitter a poison as the tongue, and there is no place where it slashes so remorselessly as among Christian people.....

WHEN Isaac Hopper, the distinguished old Quaker, met a boy with a dirty face or with dirty hands, he would stop him and inquire, "Has thee ever studied chemistry?" The boy, with a wondrous stare, would answer, "No." "Well, I will teach thee how to perform a curious chemical experiment," the old gentleman would answer. "Go home, take a piece of soap, put it in water, and rub it briskly on thy hands and face. Thou hast no idea what a beautiful froth it will make, and how much whiter thy skin will be. That's a chemical experiment; I advise thee to try it.".....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

A YOUNG MOTHER'S PHILOSOPHY.

COUSIN CLARA was giving her little four-year-old daughter a lesson in order. The sweet little thing wanted to play with her kitten, which was frolicking about her feet, and running after any flying ribbons or strings that drew her attention; but her mamma, gently yet firmly, made her move a chair up to the wall, and take her hat, and coat, and one or two other articles, and hang them on the hooks. And then she lifted the child to her knee, and said, "Now, see how nice it is to have the hat, and the cloak and all the other things on the rack, not on the floor, where mamma will step on them, and they will get so dirty." Then she kissed her, and sent her to play with her kitten.

"You do it very nicely," said I. "Where did you learn how?"

"My mother managed children pretty well; but, better than any management, was the idea that she somehow instilled into us that a child was the most precious, the most wonderful trust that God could give into our hands. It was pardonable to break, or spoil, or ruin any other object; but to spoil a child, to dim its beauty, was the great, deadly sin."

"You made a pretty stiff demand upon Eliza, and I think she responded well," I remarked. "I wish you would give me some hints as to your method."

"I try to ask nothing of her, that she has not beforehand shown that she could do. I did not require her to draw the chair up to those hooks, and hang up her things until after I had seen her do it for her own pleasure. I make responsibility follow close upon growing power. Of course, my regular reading, my sewing, my society have to be largely given up—I will not say sacrificed, for the sacrifice would be the other way. I am learning more philosophy than my schools ever taught me. The opening minds of my children do for the dull abstractions of the class-room what the electric light does for the dark corners of the city. I am learning what books cannot give. I am getting mental science in the concrete. My family is my university."

"You are a marvelous woman," I thought. No surprise that "the heart of her husband doth safely trust in her."

"I do a good deal of figuring on the children," she continued. "Sometimes I make a mistake in requiring too much, but I watch everything, and help them through as well as I can, and where I make a mistake I am more thoughtful in the future; but one thing, I am painfully conscientious about—I will keep my word with them. They are never deceived by their father or mother. They believe us, every time. And I avoid, so far as I can, all those little meaningless phrases which are the stock in trade of many parents, such as, 'maybe,' 'I'll see,' 'by and by,' which the child understands for 'yes,' and then, at times, is sharply disappointed. A mere baby will soon learn very thoroughly the 'yea, yea, and nay, nay,' which Christ taught; and all this 'next-time' business, children are absolutely ignorant of. I leave myself, as regards training, perfectly free when the difficulty arises, and no very serious trouble ever comes. I make the care of my children my most important business. I will excuse myself to a caller; I will give up any recreation, or even my church service; I will defer the buying or making of a new garment; I will put aside any and every minor interest; but I will attend to my babies, at the moment.

"You, see cousin," said I, "that I'm takin' notes, and faith, I'll print 'em. Will you tell me what you consider the gain in the exercise I have seen this morning? You have some sensible theory, doubtless."

"I will," said she. "And I shall not mention the points, in the order of their importance. If Eliza learns gradually how to pick up after herself, this will, very soon, relieve me of hundreds of steps. This habit will easily lead her to care for the younger children; and each, in its turn, will learn the same way of doing things. You see, I'm drilling her for the whole dozen. I'm making a home atmosphere which will be very helpful.

Then the house will be in better order. I do not object, mind you, to children playing and throwing things around pretty lively; but when the play is over, when they are ready to stop, they must clear away the *débris*. I will not have a nurse to do it—I will not do it myself. I will take *twice the time* to direct them, that it would take me to do it; but they shall be taught to wait on themselves. It will save time and strength in the end.

Mothers are to blame for three-fourths of the worry children cause them—they teach them to be troublesome. To be sure, my mother taught me a good deal of these matters, that most young girls never hear about. But there are books and books to learn from if they wish to read and think. The trouble is that *they don't want to read and think.* My mother taught me to respect marriage and motherhood; and when the common experiences of women, one by one, came to me, I knew what they meant. An earnest, delicate woman can deal with these vital questions without embarrassment—A frivolous, coarse woman cannot.

Children seeing order throughout the house—at the table, in their own rooms, in the attic, in the cellar, everywhere—will be disturbed by disorder, for they will be unaccustomed to it. This, more than any precept, will tend to give them orderly minds. They will carry the same principle of classification into their studies, keeping similar objects, or facts, or truths, together. They cannot be put into a sphere of life where habits of order and systematic ideas will not be of advantage. If disorder is positive distress to a person, better arrangement will be the sure result. Felix Adler says, 'Squareness of things is not without relation to squareness of thought and action.' I believe him. The object I wish to secure for my children is, that they shall lead contented, useful lives, which shall bless their community. As for the common ambitions—wealth, society, glitter and fashion—I do not think of them. They are to me perfectly worthless as aims in life. Then, I hope to be a grandmother some day, and to see all this teaching which I'm now working out put into better form, made more fruitful, and multiplied beyond my power to estimate."

Just here, Johnny gave the usual signal that he was awake. Cousin Clara went to him, saying: "Some other time, we'll continue."

MARY A. RIPLEY.

THE CHAIN AS A PROMOTER OF DOMESTIC HAPPINESS.

IN the "Ladies Departments" of the agricultural papers many nice little recipes for making homes perfectly happy have been, from time to time, published; but I have never noticed one showing how the *chain* may be utilized for this desirable purpose. Doubtless many of the RURAL'S readers have seen combs fastened to the wall in the wash-rooms of taverns, by means of a small brass chain. I have developed this crude idea and adapted it to certain domestic uses, and as the result I claim a reduction of at least 25 per cent., in household friction and worry. The enormous force required to keep the button-hook, the stove-hook, the blackening-brush the stove-poker and other domestic implements in places where they can be found, is set free and can be utilized for other purposes. Some of those peculiarly gifted people who have the mysterious faculty of keeping things in their places without apparent effort, may treat this device with ill-concealed, and others with carefully exhibited, contempt; but to the great majority of struggling households it will recommend itself as promising means of a happy release from toil and care.

Let us exhibit its working in relation to one implement of universal domestic use, viz: the stove-hook. The country-house wife, of sainted memory, who got up and made the fires while her husband enjoyed a morning nap, failed to fasten this man-saving custom upon the rising female generation, and now, the "hired lady" and even the housewife do not recognize responsibility for the performance of this important service. The "manbody" must rise and set the household in motion by starting the fires. When the resolution to do this work has been obtained, the work itself is not so difficult until the cook-stove is reached. Here the trouble commences, for unless the paterfamilias is a disciple of Nimrod—which in most cases he is not—he can't find the stove-hook. Still as evidence of the truth of the familiar adage, "Hope springs eternal in the human breast," he continues the search, though the experience of years should have taught him that it will end only in "swear words." Here at the very commencement of the day, a vast amount of physical and moral energy is expended, which the device of the chain would save. Suppose this physical and moral energy expended each morning were thus saved and directed with judgment against the book agent and the lightning-rod man, or held in reserve against the time for putting up stove-pipe!

And then the button-hook! The button-hook! The whole house may be in order, conducted upon the most approved "happy-home" principles, with just the exact amount of "pleasant smile," (which everybody knows is *so* efficacious in reducing cross husbands to a state of submissive politeness) upon the face of the mistress, but if a button-hook cannot be found at the moment it is wanted, it all amounts to nothing. And who does not know the magical powers of concealment possessed by this little instrument! Sow button-hooks shoe-mouth deep upon the floor in the evening, and it is doubtful if one could be found in the morning. But, the chain, provided it is a very strong one, will permanently locate even the button-hook. And to the father of the family who has often removed the obstructions, a milk crock or two, several baking-pans, a couple of stove-lids and a hot skillet—from the top of the stove reservoir, and got ready to dip without having anything to dip with, and who, after having skirmished around the kitchen and dining-room awhile, has returned to the stove with a soup-ladle, only to find the aforesaid obstructions carefully replaced—to this necessary though unappreciated person, I need only to suggest the advantages of having a dipper secured within reach of the reservoir by means of a chain! Is it necessary to speak particularly of the many other domestic implements of constant use? All but the most unprogressive persons will at once perceive the incalculable value of the chain as a "home-happifier" when used in the manner I have described. STEPHEN R. CRUMBAKER.

FROM A SENSIBLE WOMAN'S PEN.

ALL honor to T. B. Terry for his manly words concerning the *rights* of wives in the earnings of their husbands? And hearty congratulations to him that he is of such a noble nature as to understand the higher law on this subject—that higher law which is the true gospel as to woman's rights of every kind. And happy the wife who has a husband who appreciates the part she has in making the home—the part he cannot perform and for which money cannot pay. Yet many good and otherwise sensible women do not feel free to use the family funds as they do the smaller sums they are able to earn themselves, even when the husbands are ready to acknowledge their equal right in the family purse. It may be partly the fault of the wife. If she allows herself to ask as a favor what is already her own, she places herself in a wrong position. Her husband does her no favor in permitting her to buy their children's clothes or her own. Yet often one would suppose so from the grudging manner in which he will ask if some small sum will not be enough. There are honorable exceptions—many of them—and one good man has often been heard to refer to his immense indebtedness to the wife who has worked for her bread and clothes so many years, when, had her services been paid for as housekeeper, cook, dressmaker, tailor and maid-of-all-work, she would now be in comparative wealth. Mutual love and a common interest make every privation endurable; and there should be no thought of "mine" and "thine" on either side. Then if proper provision is made for the wife in case she be left alone, she will not have to reflect, as many a sorrowing widow has done, on the injustice that deprives her of entire control of the home she has had an equal or harder share in earning and making comfortable. So long as the law does not do justly to women, every man should provide for his own wife. A. R. D.

WHEN I WAS A CHILD.

WE often hear these words repeated; and with what interest we recall incidents of that period of innocence and ignorance of the sins and ways of the world. It is a period to which we who have passed beyond, look back as to one of great joy; a time when we knew nothing of those cares that now press so heavily day by day, the effects of which knit our brows and bend our shoulders. Here it is April once more, and house-cleaning is at hand; and we must either go at this disagreeable task ourselves, or oversee the undertaking from the drawing of the first tack to the nailing of the last one in its place. How many back-aches are in store for us, and how often will our patience be tried over the breaking of some cherished bit of property by careless hands. I hope we may all keep our patience. In our childish days no such disagreeable tasks devolved upon us. House-cleaning was a time of litter and shaking of carpets; of taking the meals when and where we could—in a sort of picnic fashion. We slept anywhere or almost anyhow, when our sleeping-rooms were undergoing the cleansing influence of lime and soapsuds. Rolls of carpet lying all about, curtainless windows, chairs standing on their heads and furniture piled in promiscuous heaps, marked the house-cleaning era, all of which we children very much enjoyed, without experiencing any of the toil or annoyance, or ever realizing that this stir and bustle made hard work for those engaged in the effort to bring order out of chaos.

White-washing done by skillful and exper-

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria

lenced hands, seemed but a bit of play, as we stood with heads thrown back and eyes rolled up watching the operation and calculating how long it would be before we would be old enough to white-wash the walls ourselves.

We found by later experience that contemplation of the undertaking was far more agreeable than the reality, and that whitewashing was not by any means so easy to do as it appeared to be. How well it is for the little ones that they have been wisely withheld from realizing what is before them; for what is more sad than a child old before its time? Let the little children run and play and grow to a ripe manhood and womanhood, that they may be ready to take their places in the ranks of workers at the proper time and age; and do not over burden them with cares, that stunt the body and warp the intellect. B. H. G.

GLITTER AND GOLD.

THERE is an old maxim that "all is not gold that glitters;" but the converse of this proposition is also true that gold does not always glitter. A few years ago I spent several hours in a large waiting-room of a depot in a large city. It was thronged with travelers—going in different directions when their trains were ready to start. Among these strangers I noticed a man in company with his wife and two or three small children. I regarded him with sincere compassion. He was so exceedingly homely that I thought his face must ache, and I wondered how he had been able to have ever won a wife, much less the fair woman with him. I lost sight of him after a time and when next he appeared on the scene, it was with a huge pitcher of steaming coffee, apparently from the nearest eating house. His little party were arranged for a lunch, with evidently the keen appetites of travelers. My homely friend began cutting huge slices of bread from a loaf, and dealing out cups of coffee, himself waiting until the very smallest one had been well served before beginning his own repast. When I saw the affectionate regard for his family which beamed on his coarse features and lit his dim eyes, I realized, as I never did before, how a great warm heart can beautify the most commonplace countenance, and I no longer wondered at the look of sweet content which rested on the features of his wife, who was evidently a woman who could appreciate a genuine good man. Here, thought I, as I overlooked the group, is a case where gold does not glitter. It was also a strong reminder of the folly of judging from appearances.

AUNT RACHEL.

A CHAPTER ON PUDDING.

A PLAIN but delicious tapioca pudding can be made with very little else than tapioca and apples. Most recipes say soak over-night, but one doesn't always know the night before that she will want a pudding the next day. Put your tapioca over in cold water and boil till it is as clear as starch. While it is boiling pare and core a few apples. The number of apples and quantity of tapioca used must be according to the number fed. It is hard to spoil the pudding it is so simple. Put the apples in another dish and cover with water, adding a little sugar and nutmeg or cinnamon and salt Boil nearly soft and then turn the clear tapioca over them and bake a little while. Serve with cream and sugar.

ORANGE PUDDING.

PEEL and cut up six oranges and sprinkle with sugar. Let them stand two hours. Boil one pint of milk, beat the yelks of three eggs, add three table-spoonfuls of sugar and a heaping spoonful of corn-starch, stir into the milk when boiling. Stir three minutes. When nearly cold pour over the oranges. Make a frosting of the whites of the eggs and one-half a cup of sugar. Spread over the pudding, set in the oven in a pan of water, and let it brown lightly.

BAKED INDIAN PUDDING.

BUTTER a skillet, put one quart of rich sweet milk in, when the milk boils stir in three-fourths of a cup of meal, let it boil until well done, then set off the stove. Take one half cup of sugar, one-half cup of sorghum molasses, three well beaten eggs, a pinch of salt, and one spoonful of ginger. Beat well together, then mix thoroughly with the cooked meal, adding milk to make it of the consistency of cream. Bake slowly an hour and a half or two hours. Good either hot or cold. Serve with sweet cream. MRS. V. W. GRIBLIN.

CORN-STARCH PUDDING.

ONE quart of milk. Take one pint, and, when nearly boiling, add two table-spoonfuls of corn-starch dissolved in cold water, and a little sugar. When done, stir in the whites of two eggs beaten stiff. Make a custard of the other pint of milk and the yelks, and pour over the pudding when cold. Whipped cream can be substituted for the custard.

SNOW PUDDING.

ONE-HALF box of gelatine soaked in one pint of warm water. Don't let it cool too much, add two cups of sugar, the juice of two lemons and the whites of three eggs. Stir all together 20 minutes. The secret of this pudding is in the stirring. Put into a mold and when firm turn it over. Eaten with a custard.

TAPIOCA PUDDING.

SOAK three table-spoonfuls of tapioca in a little water four hours. Pour off the water, put in one quart of milk and heat. When it commences to boil, stir in the yelks of three eggs, four table-spoonfuls of sugar and a little salt. Stir till it thickens. Flavor with vanilla. Pour half into a pudding-dish, over this, spread the whites of three eggs, beaten stiff, then add the rest of the tapioca. This cooks the frosting.

EGGLESS COOKIES.

ONE cup of butter, one cup of sour cream, two cups of sugar, one tea-spoonful of soda. If wished, lard may be substituted for the butter and water for the cream. In the latter case use two tea-spoonfuls of cream-of-tartar. Or, omit the soda, and use two tea-spoonfuls of baking powder.

APPLE FLOAT.

THREE large, sour apples baked, white of one egg. When the apples are entirely cold, beat with the egg to a frost. Make a custard, put the float upon it.

QUEEN OF PUDDINGS.

ONE pint of bread crumbs, one quart of milk, one cup of sugar, yelks of four eggs well beaten, rind of one lemon grated, piece of butter the size of an egg, bake. Beat the whites of the eggs to a stiff froth, add a tea-cupful of sugar, into which has been stirred the juice of the lemon. Spread over the pudding a layer of jelly, pour the frosting over, and brown lightly in the oven. Serve with cold cream. R. R.

GINGER COOKIES.

ONE cup of sugar, two cups of molasses, one cup of lard, one cup of butter, one-half cup of buttermilk, two eggs, four tea-spoonfuls of soda, two tea-spoonfuls of cream-of-tartar, two of cinnamon and two of ginger.

MOLASSES LAYER CAKE.

ONE cup of molasses, yelks of two eggs, seven tablespoonfuls of butter one-half cup of butter-milk, one and one-half cup of flour, one-tea-spoonful of soda and one of ginger. Bake in three tins and spread each layer and the top with frosting made of the whites of two eggs, two thirds of a cup of sugar and one tea-spoonful finely ground cinnamon. E. D. B.

News of the Week.

AGRICULTURAL NEWS.

SATURDAY, April 20, 1889.

DURING 1888 the "Lakeside Holstein-Friesian herd," of all ages—just 60 cows—have been tested for butter at least one week. These records have been authenticated by the Superintendent of Advanced Registry and accepted by that work. It is not the records of a few phenomenal individuals, but the average of entire herds in large numbers, that shows the capacity of a breed. Of those tested 17 were mature, five years old and over, and averaged 19 pounds 3⅓ ounces per week; 10 were four-year-olds and averaged 16 pounds 15⅓ ounces per week; 11 were three-year-olds and averaged 13 pounds 15¼ ounces per week; 22 were two-year-olds and averaged 12 pounds 1¾ ounce per week. A full list would be burdensome, but here are a few which are included in the above: Among the cows are, Clothilde 2d, 25 pounds 6⅓ ounces; Lady Griswold, 24 pounds 13 ounces; Netherland Baroness 4th, 22 pounds 5 ounces; Executrix, 21 pounds 12⅓ ounces; Benola Fletcher, 21 pounds 3¾ ounces; Kappijne, 19 pounds 12¾ ounces; Aaggie Constance, 19 pounds 14⅓ ounces; Ægis 6th, 19 pounds five ounces, etc, etc. Among the four-year-olds are, Artis Rollora, 21 pounds 12 ounces; Aaggie Rosa 4th, 21 pounds 8⅓ ounces; Princess Margaret, 20 pounds 1⅓ ounce; Lakeside Prize, 18 pounds 6⅓ ounces; Artis Helen, 17 pounds 11⅓ ounces, etc., etc. Among the three-year-olds are, Baise, 21 pounds 3⅓ ounces; Soldene 2d, 19 pounds ¾ ounce, etc., etc. Among the two-year-olds are, Argyrea 3d, 15 pounds 5⅓ ounces; Netherland Myrrhna, 14 pounds 14 ounces; Netherland Princess 5th, 14 pounds 12 ounces; Venus 5th, 14 pounds 9⅓ ounces; Executrix 2d, 14 pounds 4⅓ ounces; Clothilde 3d's Countess, 13 pounds 14⅓ ounces; Aaggie's 3d Daughter, 12 pounds 12 ounces; Ida Rooker, 13 pounds 12⅓ ounces; Netherland Duke's Nierop, 23 months old, 12 pounds 2⅓ ounces; Lady of Verona, 23 months old, 13 pounds 10¾ ounces, etc., etc.....

The immigration to the Dakotas is unprecedentedly large at this season of the year. From five to a dozen emigrant cars are attached to nearly every train on the C. M. & St. P. railroad, a majority of the emigrants being Germans, most of whom intend to start in farming. A great immigrant boom into the new States is expected during the coming summer. .....The Board of Health of the City of Mexico, has pronounced American lard an adulteration unfit for use, and has prohibited its sale. The action has been sustained by the Government and will be adopted throughout the Republic, and suitable instructions have been given to the custom-houses.....

The Ohio Senate has emasculated the anti-oleo bill by adding four amendments which render it of no use to farmers. One provides that imitations of butter must be declared injurious to health after chemical analysis before its manufacture and sale can be prohibited; another provides that neither butter nor cheese must be colored; another ordains that any firm in the State which has been pecuniarily injured by the bill can recover full damages from the State, and the other struck out the penal clause. The Senate has also killed the beef inspection bill by a vote of 16 to 15 .....The Ohio Legislature has passed a bill making the weight of a bushel of beets and carrots 50 pounds. .....

Philo Remington, inventor of the Remington rifle and head of the agricultural works at Ilion, N. Y., died the other day at the age of 73.....Michael Eugene Chevreul, the famous French chemist, who made a number of discoveries of much importance to agriculture, is dead at the age of 103. He retained many of his faculties to the last, but was quite helpless of late years.....

Secretary of the Navy Tracy has been a large breeder of trotters. Thursday 49 of his stock were sold here at auction, bringing a total of $54,083—an average of $1,104. Wednesday the same number were sold, bringing $59,820, an average of nearly $1,221. The total of the two days' sale was 98 horses, a large proportion of which were youngsters, which brought $113,905, an average of $1,162 per head. Abbie, a George Wilkes mare, 12 years old, brought the top figure—$5,900.....

The Maple Sugar Exchange at Brattleboro, Vt., has received 31,340 pounds of cake sugar and 27,541 pounds in pails, besides 4,216 gallons of sirup.....Dairy Commissioner Tatam, of Connecticut, says that not one-third as much "oleo," is sold in that State as there was two years ago, while the sales of butter have increased by $464,000. The United States Government has gained $25,000 from the "oleo" licenses .....George T. Angell, President of the Massachusetts Society for the Prevention of Cruelty to Anamals, 19 Milk Street, Boston, offers a reward of $100 for evidence enough to convict anybody in the State of docking horses' tails. Three convictions have been already secured. .....

Beef exports in March increased 7,123,000 pounds, or 45 per cent. as compared with the same month last year..... .....There is great activity throughout the South in building cotton-seed oil mills in opposition to the Cotton Oil Trust. A society to build a dozen mills to cost $1,000,000 has just been organized in the South, and a Philadelphia company is to put $2,000,000 into the business. Planters are likely to get something like reasonable prices for their cotton-seed..... .....

The Forestry Division of the Department of Agriculture has issued a circular giving instructions to school officials who are interested in the celebration of Arbor Day. Send to B. E. Fernon, Washington, D. C.....

The annual meeting of the American Jersey Cattle Club will be held at the office of the Club, No. 1 Broadway, N. Y., on Wednesday, May 1. Dr. H. M. Howe, President, and F. W. Wicks, Secretary. The Jersey breeders will hold a convention on May 7, at the Fifth Avenue Hotel.....

A simple device is reported to have been perfected at Quincy, Illinois, which will render farmers independent of the Binding Twine Trust. For some weeks a harvester has been at work in the tall sedge grass on the Missouri bottoms, opposite Quincy, binding with wire instead of twine, and the device for doing so is pronounced a complete success. A twister is simply substituted for the knotter used in the twine binder. The farmer can therefore use either wire or twine, and the change can be made in a moment. It is stated that the old objections to wire binders have been obviated in the new attachment..... .....

Canada proposes to make it a penal offense to export cheese from the United States to England, via Montreal, with the words "Canadian Products" marked on the packages. It is said such a practice greatly injures the high reputation of Canadian cheese abroad .....

Farmers through their organizations are urging the legislatures of Michigan and Illinois to provide for the manufacture of binding twine by the convicts in the penitentiary and the farmers of Mississippi want cotton bagging made by the State convicts. Ex-Commissioner of Agriculture Dr. Geo B. Loring has been nominated and confirmed as U. S. Minister to Portugal .... The Pennsylvania legislature has refused to tax oleomargarine and to create the new office of State Dairy Commissioner .....Florida orange growers are beginning to consider that the business of orange planting has been overdone. It is said that the production 10 years hence, when all the trees now planted are in full bearing, will be enough to supply one box annually to every man, woman and child in the United States..... .....

A bill just introduced into the New York legislature offers a bounty of a half cent per pound for sirup from sorghum grown in this State. The sirup must weigh 11 pounds to the gallon. The manufacturer may put up works worth any sum up to $6,000 and the plant is to be for 10 years free from assessment or taxation for State, county, municipal, town and school purposes. The sum of $3,000 is appropriated for the payment of bounty during the first year of the act..... .....Owing chiefly to the comparatively small balance to the credit of the Department of Agriculture, as much of the appropriation for the current fiscal year, ending June 30 next, has been expended, Secretary Rusk has discharged 80 of the employees in the Seed Division of the Department of Agriculture, and is making few additions or changes anywhere .....A beet sugar company has just been incorporated at San Francisco, with a capital of $5,000,000, with Louis Schloss, A. L. Cutts, F. Ehrmann, Claus Spreckels and John Spreckels as directors, the last two holding half the stock. The object is to erect large sugar refineries at various points on the Pacific coast in addition to the one already established at Watson, Cal., with the purpose of refining from 50,000 to 60,000 tons of beet sugar a year. This would make up nearly half our present annual imports.....The Acme Company, of Wilmington, N. C., and "a number of outside capitalists" have agreed on the immediate erection, thoughout the pine regions of the South, of factories for the manufacture of pine-straw bagging for cotton. It is expected that this movement will go a great way towards checking the extortion of the jute bagging monopoly.....

One death and two cases of sickness which must inevitably end with death, have been lately reported from handling glandered horses..... ..The New York Hay and Straw Dealers' Association was organized on the 17th inst. at Syracuse. Nearly every county in the State was represented. Willis Bullock, of Canajoharie, was elected president; C. C. Caywood, of Woodstock, vice-president; W. H. Falke, of Albany, secretary, and T. W. Smith, of Penn Yan, treasurer. The principal object is said to be to get rid of middlemen in the New York, Boston and other Eastern markets. Wouldn't this object be accomplished better by an association of producers than by one of dealers?.....

Called Back.

There is a famous novel by Hugh Conway entitled "Called Back." From a facetious proneness we are indirectly reminded that this is also the name of the supporter of erect stature, the spinal column is *'called back.* Disease may weaken it—weariness wear it, health leave it; briefly prostration may drive its vigor away. but we are pleased to remind you that vigor also may be "called back," by Compound Oxygen treatment.

Here is some encouragement:

PENSACOLA, FLA., July 25, 1888.

"I suffered from a very severe and obstinate case of bronchitis. I had tried a great many doctors' remedies, and while I am not entirely well, I am very greatly improved, and feel fully assured that the same is due to your Compound Oxygen Treatment."

WALLA WALLA, WASH. TER., April 9, '88.

"I have now used your Compound Oxygen Treatment for two months, and feel much better than I did before using it. My lungs hold double the amount of air they did at the time I first tried it. N. K. GABRIEL.

BROOKLYN, N. Y., June 4, 1888. No. 331 Decatur St.

"I will always recommend Compound Oxygen as the greatest vitalizing agent known; for I certainly feel that it has prolonged my life" MRS. S. H. HENDERSON.

If you desire convincing proof of its efficacy—that is if you will consider authenticated testimonials as such, then send for our brochure of 200 pages containing full and explicit information on the subject of Compound Oxygen, together with a record of cures in many cases of consumption, asthma, catarrh, bronchitis, dyspepsia, hay fever, headache, debility, rheumatism, neuralgia, all chronic and nervous disorders. It will be forwarded, free of charge, to any one addressing DRS STARKEY & PALEN, No. 1529 Arch street, Philadelphia, Pa.; or 120 Sutter Street, San Francisco, Cal.—*Adv.*

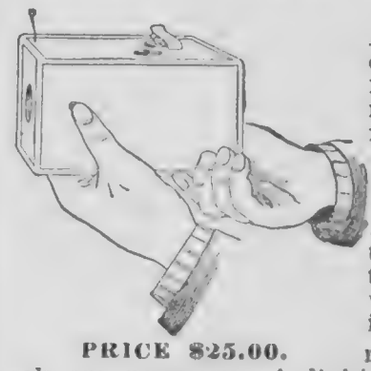
The Kodak.



ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be reloaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

PRICE $25.00.

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker

"DO YOU SEE THIS MAN?"

"Yes, Pa, who is he? Is it President Harrison?" "No, my son, he is a celebrated manufacturer of Railway Cars, and he is writing a letter to the public, telling them that *Wood* and *Steel* and *Iron* is the best combination for a Car, a Wagon, or a Harvesting Machine. He says an "All-Steel" Car would not be a success any more than an All-Steel Binder. He agrees exactly with the testimony of Mr. H. H. Sessons, the manager of the Pullman Car Co., who in a recent interview on this subject said: '*Wood cannot be discarded* in the manufacture of cars. In 1868-9 I inspected some all-iron cars and found them utterly useless after a few years' service. *A wooden truck is longer lived* than a metal one. And in a wreck, where the cars are twisted and bent, an all-iron or all-steel truck cannot be as readily repaired. *The racking strain* of the car *will buckle the iron or work the rivets loose.* No matter how thick the paint, the elements will also in time rust the rivets off an all-metal car. Frost also produces oxidation on all-metal cars.'"

THE BUCKEYE BINDER is made of **WOOD and STEEL and IRON.** Send for catalogue to

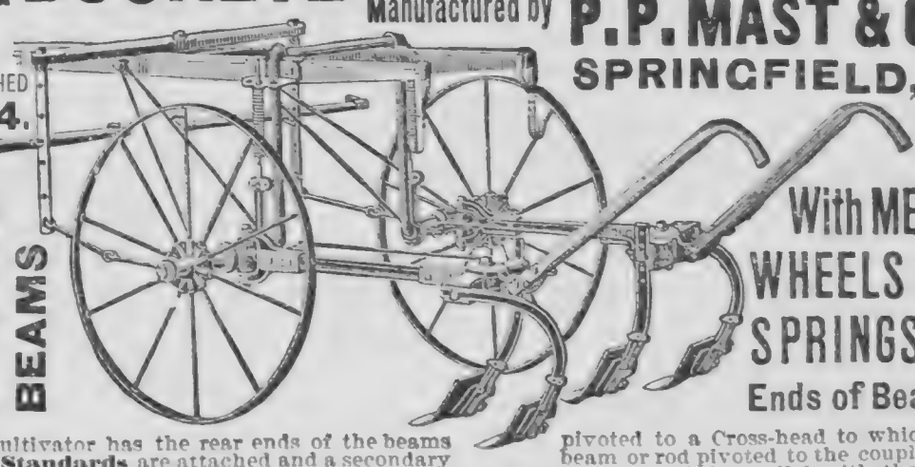
NEW BUCKEYE SUNBEAM CULTIVATOR

Manufactured by **P. P. MAST & CO.**
SPRINGFIELD, O.

ESTABLISHED 1854.

With PIVOTED PARALLEL BEAMS



With METAL WHEELS and SPRINGS at Ends of Beams.

This Cultivator has the rear ends of the beams pivoted to a Cross-head to which the **Shovel Standards** are attached and a secondary beam or rod pivoted to the coupling in front and to the Cross-head in the rear, by which the Shovels are carried parallel with the axle, whatever may be the position of them in being moved sidewise. The spring at the front end of the beams supports them when in use, and enables the operator to move them easily from side to side and assists in raising when he wishes to hook them up while turning at the end of the row. We attach these Beams also to our **Riding** and **Tongueless Cultivators.** This Cultivator has no equal in the market, and can not fail to be appreciated by any farmer who sees it. We also manufacture the BUCKEYE DRILL, BUCKEYE SEEDER, BUCKEYE CIDER MILLS AND HAY RAKES.

Branch Houses:—**Philadelphia, Pa.; Peoria, Ills.; St. Paul, Minn.; Kansas City, Mo.;** and **San Francisco, Cal.** Write for Circular to either of the above firms or to

OUR FIRST FARMERS' INSTITUTE.

BY WM. ROSS.

CHAPTER I.

THE FARMERS' INSTITUTE I propose to write about is not an institute held in some far-off locality, of which no one ever heard, or one which had its rise and progress in the imagination of a writer of fiction; but an institute in our own State of Ohio. Woodside, the county-seat of Excellent county, is a village of 1,200 to 1,500 inhabitants, that has grown to its present dimensions within the last 30 years. About that long ago the county-seat was located in Col. Woodside's fields where the beautiful town now nestles among the hills that surround it.

Excellent is a county of hills and valleys, but a great part of it is what the farmers call "strong lands," and limestone in great abundance is distributed over the county. The sources of several branches of three different creeks are within the limits of the county. The bottoms along these are mostly rich, being fed from the surrounding limestone hills. In its primitive condition the land was very heavily timbered with oak, magnolia, maple, beech, hickory, etc. Before the age of railroads, all products had to be transported by wagon a distance of from 10 to 40 miles to navigation. The early settlers were thus forced to produce such crops as would not be injured by waiting till such times as they could be taken to market, and that always brought money at some price, or could be fed to the stock, which could be driven to market on foot. Hence wheat, tobacco and hogs became leading products, and it ranked among the foremost counties in the State in tobacco, in the statistical tables.

The laborious tasks of clearing off the timber, cultivating among the roots, hauling long distances to market, and other toilsome duties incident to the earlier times, made it desirable to the farmers to adopt such conveniences as might be within their reach. They frequently built their stables on the banks of water courses, so as to be convenient to water for stock, as well as to get easy water transportation for the manure that might accumulate, and eventually cause the removal of the stable before they were ready for the event. The hog-lot, of course, had to have water running through it for the same reasons, if it could be had, and it generally could.

It is said the "world moves," but it seems to be moving backward in the matter of conveniences on the farm. The afore-mentioned conveniences are giving place to barns and hog-pens built back from streams, and the stock have to be taken some distance, or water has to be pumped from wells or cisterns. The farmers have, also, to haul the manure out and scatter it over the hill-sides, to get rid of it, which is hard work and very inconvenient. As the early settlers had to have the cream of the land to live on and pay taxes, it was very convenient to let the skim-milk run off and be carried away in the streams. But some of the present occupants are trying to stop these convenient washings, and to get grass to catch, and sod over the hill-sides. In many cases this is found to be a very inconvenient task to accomplish. This being the case, the subjects "How to Retain Fertility of Soil," and "How to Renovate Worn-out Soil," were very popular at our farmers' institute recently held in Woodside.

As this was the first institute we ever had, its history and how it was run are intensely interesting to some of our Excellent county fellows, though, so far as I know, it may not differ materially from other institutes. Some of the farmers had learned somehow, and we don't know how, unless they had been reading agricultural papers, that such things as institutes were being held in different localities in the State, and several times we came near catching the institute fever; for occasionally one farmer would say to another: "We ought to have an institute," and the other would reply: "Yes, we ought." Sometimes, too, the papers would say that we ought to have a farmers' institute; but these mild symptoms, which assumed a periodical character, always subsided without assuming alarming proportions, and so the institute always stopped somewhere before it arrived here. Woodside had a fever epidemic last fall, and the periodical symptoms of this one flashed up, and they kept on developing until we got it bad, or got it good, whichever way it was.

CHAPTER II.

WE now introduce two characters that figure conspicuously in our story. They were familiarly known as Jack Edwards and Bill Bark. Mr. Edwards was a "well-to-do" farmer and kept sheep. He formerly lived in a rough, lonely place in an adjoining county, and had once attended an institute in that county. He had purchased a small farm that was very pleasantly situated in the vicinity of Woodside, but the land was badly run down. His family was small and he rented his old homestead, and now lives a half-retired life on his new purchase. He had had a foretaste of institutes and was hungering and thirsting after more, for he wanted new ideas to comfort him in working up his new purchase so it would hold grass, and he knew that a farmers' institute was the place to get them. Bill Bark had been a resident of Excellent county for nearly 40 years. He had obtained a fair education, was very fond of reading agricultural as well as other literature, and therefore was always pretty well read upon all agricultural matters. During the earlier years of his life he had been engaged in general farming and stock raising, and had reared a large family, which was now scattering off, as most families will. He had recently changed his residence to a little home in the suburbs of Woodside, where he and family could better enjoy the conveniences and advantages that contribute towards making life pleasant. Not keeping much stock now, he had more time at his disposal to read than formerly. He had held responsible offices in the county and had had a taste of the inwardness of politics. Several times during his life he had assisted to start and carry on new societies and companies, and knew what time and labor it required to lead such things to success, and they had as often failed as succeeded. He seemed now to have become disgusted with the whole public spirit business, and made it a rule to refuse whenever solicited to engage in any public enterprise. So he had let all the little flashes of institute interest pass by with almost stolid indifference. He preferred to sharpen his mind with the product of other minds, by his own fireside, as it came to him through the printing press.

One day in October, about a month after the Woodside Fair, these gentlemen met on the sidewalk.

"Some of us was a-talkin', out at the fair, about gitten' up a farmers' institute this winter," said Edwards. "Do you know how to go to work to get it up?"

"Is that so?" responded Bark. "I had not heard anything about it. The way to get it up, is to just go at and get it up, I suppose."

"I was talkin'," said Edwards; "to James High, and David Color, and they agreed to open a discussion on hogs; and young Mr. Hinton will take sheep, and we wanted to see you if you wouldn't speak on Market Gardenin'."

"Oh! yes," said Bark; "I'll help you out on that subject."

Mr. Edwards continued. "As Sheriff Neelan's President of the Fair and Judge Forester's Secretary, we wanted to git them to be President and Secretary of the institute, and they agreed to it, as it would help the fair some, and it would have some influence in favor of the institute."

"I think Sheriff Neelan and Judge Forester have about all they can do without getting up institutes," said Bark. "They are good men for the places, but they are in politics, and after the campaign is ended it may be too late; besides, they have their offices to look after anyway."

"We was tryin to find some one that would open the discussion on horses" said Jack. "Do you know any one that would take that subject?"

"Well, no," said Bark, "There is Joe Swap and Taylor Dicker. They can come as near seeing through a horse as anybody, if he is for sale or trade, but I hardly expect they would speak in public. I think the first thing you should do, is to get Judge Forester to write to Secretary Bonham, at Columbus, and learn whether you can get speakers. The sooner that is done the better, as the Institute Committee will be arranging the work before long."

"Well," said Edwards, 'I'll do that right-away."

This conversation seemingly began to fan up the smouldering coals of interest in public affairs, that had been lying dormant somewhere in Bill Bark's nature. He went to thinking the matter over. Judge Forester was a stoutly built, strong man, but at this time he had about as heavy a load of politics as he could carry. Sheriff Neelan was one of the tallest men in the county, but he was in politics up to his ears, if not farther. Bill had been there and he knew how it was, himself. Both these gentlemen belonged to the same party, too, and political farmers, or farmer politicians, whichever they might be, of the other party would be soured, and how the placing of these gentlemen at the head of the institute would carry influence to it, was something he was unable to understand. But then, it was not his bantling, so he would not interfere, as he was determined not to come to the front in anything of the kind again, for he had had his full share of chagrin, and had even been sneered at for planting briars when he planted out his first raspberry patch. However, nearly all his neighbors have followed his example in this, now.

(To be Continued.)

CATALOGUES, ETC., RECEIVED.

THE CONSTITUTION OF MILK, AND SOME OF THE CONDITIONS, WHICH AFFECT THE SEPARATION OF CREAM.—This is the title of Bulletin No. 18 of the Wisconsin Experiment station. It was prepared by Professor S. M. Babcock, and, as the R. N.-Y. stated two weeks ago, is one of the most important dairy publications that has been recently issued. Starting with the assertion that the manufacture of butter is one of the oldest industries of the country, and is hardly exceeded in money value by any other manufacturing interest, Professor Babcock goes on to say that this vast business is still conducted almost entirely by unskilled labor, while every other business has been developed and systematized to a wonderful degree. Doubtless many of our farmers' wives and daughters will not relish this statement. But do they really perform "skilled labor?" The skilled mechanic knows not only how to put the parts of his machine together, but he knows about the composition of the metals, how the polishing is done, where strength is needed—in fact, he is master of his machine because he can absolutely trace each part from the crude ore or the growing tree. Should the really skilled dairyman know less than this about his business? Should he have anything to guess or should he know what milk is, what cream is, why cream separates from milk, why and how milk sours and under what conditions cream yields up butter? If it is possible to know any of these things, is it not likely that the dairyman who masters them has a clearer right to the title of "skilled worker," than the dairyman who ignores them? It seems to the R. N.-Y. that Professor Babcock must have had something of this idea in mind when he devised the plan of stating in the simplest manner possible, facts connected with the mechanical and chemical constitution of milk and cream. We cannot give the entire bulletin here. We have space for only a few of the more important conclusions. We most earnestly commend the bulletin to those dairy people who wish to study the principles of their business and so inform themselves that they may "know just what they are doing." The R. N.-Y. is of the opinion that our dairy readers will find a good deal to instruct them in the pamphlet. Here are the conclusions. Their real value will be brought out by tracing them through the long line of experiments that lead up to them. This one may do in the pamphlet under review.

PRACTICAL DEDUCTIONS.

1st. The milk should be disturbed as little as possible before it is set, and should be strained directly into the creaming vessel, immediately after milking. It is bad policy to strain milk into a large can and dip the milk into other vessels for creaming, as the agitation and exposure to air occasioned by such practice promotes the clotting of the fibrin and prevents a thorough separation of the cream

2nd. The material of which the creaming vessel is made should have a smooth surface and it should be a good conductor of heat. These conditions are best fulfilled by metal vessels, and practically tin is the best material to use, as it is cheap, easily cleaned and not liable to rust. Neither wood, earthen nor glass vessels are to be recommended, as they are all poor conductors of heat. Wooden vessels are difficult to clean and lass or earthen vessels are easily broken, and the surface of wooden vessels is particularly favorable to the formation of fibrin clots. In comparative tests no vessels have given so good results as those made from tin. Were it not for the danger of corrosion with copper, this should be the best material from which to make creaming vessels, as it is a better conductor of heat than any other common metal.

A tin vessel that is immersed in ice water quickly cools the milk that is in immediate contact with it to a point where coagulation of fibrin does not readily take place, and as the formation of clots begins at the sides of the vessel the coagulation is to a large extent prevented. In general, it is the clots which are in contact with and adhering to the sides of the vessel which are most detrimental, as clots which are not attached are mostly carried to the surface by the fat which is entangled in them. This explains why a large can that cools off slowly will cream as well as, or even better than a small can that is rapidly cooled, as in such the sides may be kept cool enough to prevent changes in the fibrin, while the mass of the milk is still moderately warm and offers the best physical conditions for the separation of the cream.

3d. The creaming vessel should have such a shape that the surface which is in contact with the milk shall be as small as possible in proportion to the amount of milk; this condition would be best fulfilled by a spherical vessel but a vessel of this form, would be inconvenient in practice and will not be considered. The next best form is cylindrical. In such a vessel the ratio of surface to volume will diminish as the size of the cylinder increases and, so far as this one factor is concerned, the larger the cylinder the better; but there are practical considerations which limit the size of the creaming vessel. In the first place, its depth should be such as will permit the creaming to take place in a reasonable time. It is desirable in most dairies that the creaming be completed between milkings or in 10 or 12 hours, so that the same cans may be used at the next milking. It has been found in practice that this may be accomplished, under favorable, conditions with a depth of 20 inches and this depth should not be much exceeded. The diameter of the can may depend upon the number of milkers; it should not be so great as to prevent its being quickly filled, but providing this can be done the larger the can the better. Where there are a number of milkers large cans may be used; but where there are only one or two milkers small cans should be chosen. In any case, it is not well to have a can so large that it cannot be conveniently handled.

CONCLUSION.

1st. That milk when fresh is a perfect emulsion, the fat globules being free and without an envelop.

2nd. That the chief differences in the composition of normal milks are due to variations in the amount of fat, the remainder of the milk, known as the milk serum, being quite uniform in composition in all milks. The variation in the amount of serum solids in milk from the same cow, is rarely more than one half per cent., in milk from different cows of the same breed, it is usually less than one per cent., and in milk from cows of different breeds not more than two and one half per cent. This holds true even when the fat varies as much as seven or eight per cent.

3d. That milk contains a principle analogous to, or identical with blood fibrin, which is capable of spontaneous coagulation, the clots of which entangle the fat globules and to a considerable extent prevent an efficient creaming.

4th. That the most efficient creaming is obtained when conditions are supplied which retard or prevent the coagulation of fibrin. This may, in practice, be best accomplished by setting the milk, directly after milking, in cold water (ice water is best), the creaming vessel to be of bright tin or other metal that can be easily kept clean.

5th. When the milk is transported or when for any reason the setting must be delayed, no method of creaming gives as satisfactory results as the centrifugal.

SUPERIOR DRAIN TILE.—It is always a pleasure to speak a good word for a reliable product that is supplied by a thoroughly reputable house. We like to have our friends obtain such goods, because we know that they are by far the cheapest in the long run. The drain tile made by Jackson Bros. of Albany, N. Y., surely come up to the standard we have indicated. The house is fully reliable, having been in business so long, and having based its reputation so fully on the excellence of its goods that words of commendation are entirely unnecessary. We can only inform our readers that, if they want to purchase first-class tile, they cannot do better than to send to Jackson Brothers.

FERTILIZERS.—The New Hampshire Experiment station director has issued two bulletins designed to serve as a primer and first reader in the science of chemical manuring. They are bright pamphlets, well written.

FENCING AND ORNATE WIRE-WORK.—Catalogue from the Hulbert Fence & Wire Co., St Louis, Mo. A very neat and handy little pamphlet containing the newest designs for ornamental and practical fencings. The Hulbert Company are extensive manufacturers and their products are very popular—justly so, it seems to the R. N.-Y.

SOILS, WEATHER, FIELD TRIALS WITH CORN.—These topics are discussed by Chemist Schweitzer, in bulletin No. 5 of the Missouri Experiment Station. The experiments recorded here seem to have been conducted with a great deal of thoroughness. Those who are in any way interested in the study of soils will be glad to read the first half of this bulletin.

VERMONT DAIRYING.—The Nineteenth Annual Report of the Vermont Dairymen's Association is sent by Secretary E. L. Bass, West Randolph, Vermont. This is an excellent pamphlet, well edited and packed with useful information. It contains, in full, the papers read at the last meeting of the association. The RURAL gave a very full report of this meeting, and also gave the "pedigrees" of most of the samples of prize butter.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

A WATER-COURSE.

H. G. O. E., Sandwich, Mass.—1. A purchases a lot of land of B who, in the deed to A, provides that he (A), his heirs and assigns shall make and maintain forever the whole of the fence where said lot adjoins B's land. Afterwards B sells the land adjoining A's to C, making no reference to said fence. Is A by law obliged to make and maintain all said fence between him and all succeeding purchasers or owners; or will they or any of them be obliged to make one half?

2. A purchases part of a swamp for the cultivation of cranberries. In flowing his meadow in winter and at other times, some adjoining land belonging to B is overflowed by the water from springs the only outlet for which is through A's land. To prevent said overflow and to avoid any claim for damage from B, A builds a dyke which prevents the overflow but dams up the water from said springs in the adjoining land, which raises a permanent pond where there was before only an occasional overflow. Can the owner of said adjoining land, C, after the building of the dyke, collect damage from A, or will he be obliged to find an outlet for said water at his own expense? An outlet can be had by a ditch around A's cranberry meadow, a privilege for digging which would be readily granted.

ANS.—1. An agreement to maintain a boundary or division fence is irrevocable, except by mutual consent or in some way provided by statute. The covenant to erect and keep the fence in repair runs with the land and is binding on the covenantor, his heirs and assigns, even if no reference to it is made in the deed given to C. 2. A has no right, in order to benefit himself by constructing a cranberry bed and by providing against a suit by B, to injure C by making a permanent pond on his land. If he does so, he renders himself liable for damages. He ought to pay for digging the trench around his cranberry meadow and thus give the water an outlet without doing injury to any of his neighbors.

TITLE OF LAND IN COPORATIONS.

L. T., Lincoln County, Neb.—Some years ago the line of a branch railroad was surveyed through a farm of mine in another part of this State. Damages were assessed and paid, and the required strip of land was fenced in. There the matter rested, and now I understand the project of building the road has been abandoned. To whom does the land belong?

ANS.—The fee simple of the land has all along been vested in our inquirer, if he has continued to own the farm. The railroad acquired only an easement in the land, that is, the right to use it for a certain purpose—the construction of the road. If the corporation is dissolved and its franchise ceases to exist, its interests in the land at once revert to the original owner, his heirs or assigns. In a word, during its artificial life, which may be for centuries, the corporation owns the right of way and no more. This principle applies to all corporations that have power to take land for public use, and even to the county, State or national governments.

IS IT GENUINE?

PROBABLY thousands of people in this section of country, and this section is no exception to any other in this respect in the United States, have read the report said to have been written by Prof. S. A. Lattimore, Ph. D., LL. D., Analyst of Foods and Medicines, New York State Board of Health, and Professor of Chemistry in the Rochester, N. Y., University, stating that all of the Safe Remedies manufactured by H. H. Warner & Co. were pure and wholesome, nor did any of them contain any mercury or deleterious substance. To shorten the controversy, however, we will give Prof. Lattimore's report entire:

UNIVERSITY OF ROCHESTER,
CHEMICAL LABORATORY.

Mr. H. H. Warner has placed in my possession the formulæ of the several medicines manufactured and sold under the general designation of "Warner's Safe Remedies." I have investigated the processes of manufacture which are conducted with extreme care and according to the best methods. I have taken from the Laboratory samples of all the articles used in the preparation of these medicines, as well as the several medicines in which they enter. I have also purchased from different druggists in this city "Warner's Safe Remedies," and upon critical examination I *find them all entirely free from mercury and from poisonous and deleterious substances.*

S. A. LATTIMORE, Ph.D., LL.D.,
Analyst of Foods and Medicines, New York State Board of Health, Professor of Chemistry, University of Rochester, N. Y.

We cannot think that a firm of the standing of H. H. Warner & Co. would dare publish such a statement if it were untrue, and we now have that firm's authority to say to our readers that it is absolutely and unqualifiedly true in every particular.

(*From the Country Gentleman, April,* 1889.)

Cheap at the Price.—The Pennsylvania State Board of Agriculture reports the analyses of a great number of "complete fertilizers," one of which, selling at $20 per ton, is stated to be worth $1.12; another, selling at $18, is worth 17 cents; a third sells for $21, and analyzes for 71 cents. Several brands, however, are estimated to be actually worth something more than their cost. Prominent among these is the "Mapes complete manure for general use," offered by the Mapes Formula and Peruvian Guano Co., of New York, at $40, while the State Board analysis makes it really worth $42.93.

Send for descriptive pamphlet. Mention the crops for which fertilizers are wanted. Address

SCAB

H. C. & J. C. GROOME, of Locust Hill Stud Farm, Wythe county, Va., say of THYMO-CRESOL (The Cold-Water Dip): "*It has been with us notably successful in curing Scab in Sheep, in an advanced stage. We have found the growth of the wool materially promoted by dipping Sheep in it early in autumn. It destroys Lice on Colts, is a most useful dressing for the Hoofs of Horses, and a valuable remedy in cases of Grease and Thrush. We have found it a speedy cure for Mange, and as a Disinfectant and Purifier its merits cannot be too highly commended. In fact, the limits of its usefulness to the stock-breeder are difficult to realize, and here we should be inclined to feel quite helpless without it.*" Imported only by T. W. LAWFORD & CO., Baltimore, Md. Sample by mail for 50c.

THE WEEPING BEECH.

SOME 20 years ago the writer first saw a specimen of this odd tree in the grounds of R. B. Parsons & Co. of Flushing, Long Island, N. Y. About 12 years ago the R. N.-Y. sent an artist to sketch this tree in early spring, before the buds had started. Its portrait, as it appeared in summer, had been published in many horticultural periodicals, but the R. N.-Y. was the first to show the eccentric, freaky growth of its branches, which in summer are almost entirely concealed by their luxuriant foliage. Our present illustrations show a tree which was planted in the Rural Grounds 15 years ago, the one (Fig. 102) a winter, the other (Fig. 101) a summer picture. In the former, two sheets were placed behind the tree so as the better to divide the spray from the background of other near-by shrubs and trees. In the summer picture, the photograph so blends the foliage of the beech with the trees behind it that its proportions must, in great part, be guessed at by our readers.

The main object in presenting the pictures is to show the reader about how long it is needful to wait ere his Weeping Beech may be expected to develop the picturesque beauty for which, above almost any other tree, it is distinguished. The R. N.-Y.'s specimen is now 22 feet high with a diameter of 18 feet near the ground.

The movements of the branches of this tree from year to year have been watched with much interest. What at one time were pendulous branches are now horizontal or even perpendicular, while some of those that were formerly upright have assumed various degrees of pendulosity. It is a tree that doesn't seem to know its own mind, or perhaps, it might better be said, a tree the various parts of which delight in showing their independence of each other.

In 1881 this tree was 12 feet high. The first winter after it was received from the nursery the leading (only upright) branch was killed back so that only pendulous branches remained, and these drooped in a direction almost parallel with the main stem. It was assumed that the *next* leader would come from the growth of some of the topmost buds.

The next year very little growth was made; but the third year it was noticed that *one* of the top branches was changing from its pendulous position towards a perpendicular. It continued to rise until the fall of the leaf when it was found to have moved through an arc of at least 60 degrees. The next year it assumed full leadership and a slight bend in the trunk is now the only evidence that this interesting change ever occurred.

THE WEEPING BEECH. Summer Picture. Fig. 101.

Horticultural.

BIG VEGETABLES.

If a farmer's boy—or for that matter a farmer's boy's father—were to be asked as to whether his primary object in raising a crop would be best served by getting a large crop, or large specimens of an ordinary yield, is there any one who doubts as to what the answer would be? Visit any boy's vegetable garden, or any girl's flower garden and the chances are ten to one that the big pumpkin and tall corn, and the great sunflower and biggest pansy will be pointed to with the proudest finger. It is not far from being just the same in father's field—the Herd's grass up to the shoulder, the mammoth potatoes and the yard-long tobacco leaves ask for first praise, with the matter of tons and bushels of secondary consideration. I say nothing about the farmer's wife, the boy's mother. But I will, for such am I, and——I admire the prodigies of the field and garden as much as "father," Will and Ruth can do. For their benefit and to stimulate their endeavors, I have prepared from my note-book, the RURAL and some other papers, a "record of big things," which I think may interest the readers who "seek the same ends." The largest squash on record was a Mammoth Chili, raised by Charles Hewitt Esq., Lunenburg, N. S., and weighing 292 pounds. This same gentleman, in 1885, raised a Potiron pumpkin weighing 206½ pounds; but Jos. Quinn of Bryantsville, Ky., beat him with one of 226 pounds. There are three varieties of big onions, Silver King, Pompeii and Red Victoria. In 1886 A. Banister, of Meadows, W. T., grew a Silver King weighing 4 11-12 pounds and G. F. Montgomery of Pownal, Vt., one of 4 1 12 pounds. The biggest Pompeii on record was raised in 1886 by G. H. Slaymaker of Atkinson, Neb., five pounds and five ounces. The Victorias this year brought out by Burpee are said to be the largest of all. The largest cucumber reported was a Giant Pera, grown in 1888 by Theo. Southard, Madison Station, Ala. It measured 22 inches in length and 14 inches in circumference and weighed seven pounds and 10 ounces. For watermelons, John G. Miller of Stone Mountain, Ga., has the best record. In 1883 he grew three Cuban Queens of 81, 97 and 111 pounds, and in 1886 a Mammoth Ironclad of 110 pounds seven ounces and one of 128 pounds. The biggest pepper I ever saw was a Procopp's Giant, grown by W. A. Burpee, Doylestown, Pa. and measuring three by nine inches.

In 1888, E. O. Hopson, Canandaigua, N. Y., grew a Turner Hybrid tomato of two pounds nine ounces. A common weight is 25 to 30 ounces. In Bucks county, Pa., it is quite common to find leaves of the Persian Rose Muscatelle tobacco measuring 3½ by 4½ feet. The Golden Wax Flageolet pole bean and the King Lima grow pods eight inches long. The Cuban Asparagus bean has them two feet and upward in length. The Golden Mammoth mangel weighs 20 to 30 pounds. The Marblehead Mammoth cabbage grows to a weight of 50 pounds. The Mammoth Late is the largest sweet corn, weighing two to three pounds each ear. The Snake cucumber grows six feet long. The Mammoth Russian sunflower has heads 12 to 22 inches in diameter. The flower of the Fairy Blush poppy is 10 to 13 inches in circumference The Diamond aster is two to three inches in diameter. The Burpee Defiance pansies are two to four inches across. The Moon-Flower measures four to six inches in diameter. The Tuberous-Rooted begonia and the Giant Mammoth zinnias have flowers four to six inches across. The Perfection Pink balsam has flowers 2½ inches across. Other large vegetables and flowers might be mentioned, but these, measured and weighed by the gardeners on the Fordhook Farm (Mr. Burpee's, at Doylestown, Pa.) fully satisfied the curious visitor.

I might add, in closing, that I was assured last summer that in England, while they did not grow so many such enormous vegetables as we do, they "beat the Americans" with the largest number of medium-sized. The implication is that our vegetables are either notably very large or very small, with but little of "the happy mean." I wonder if it is so!

MRS. L. M. C.

[Large specimens of fruits or vegetables will always be regarded with interest.—EDS.]

Pomological.

Apple Culture Suggestions

AN OLD QUESTION REVIVED

ANSWERS BY POMOLOGISTS

LAST fall the following appeared in the RURAL:

STARTING AN ORCHARD FROM APPLES.

For many years I was under the impression that an apple tree would need some trimming—but otherwise it would take care of itself—that it needed no more looking after than a forest tree. But the reading of the RURAL for eight or 10 years has changed my notions. I have mulched, manured and placed ashes around the trees and have been surprised at the result. Trees that bore small, spotted apples before treating them, have since borne fruit double in size, smooth and well-formed I applied ashes and manure to a Vandevere tree, as I thought, in liberal quantities, but for the first dozen years I did not get a bushel of apples from it. Last spring I hauled two loads of ashes and three loads of manure around it, making a mulch six inches deep, and we will get from this tree three or four barrels of fine apples this year. It may be that I overdid the good work and the tree may die from an over-dose of manure, but at this time it is very thrifty in appearance. This fall I shall plant an apple in the spot where I wish the tree to grow and save the best sprout for grafting, so that the tree shall have no check from breaking of the roots, such as occurs in removing the tree from the nursery to the orchard. To mark the spot where the apple is planted, I shall place a common drain tile. If a tile will exclude the sun and air too much I shall saw the tile into three or four-inch lengths. S. B. H.

Crawfordsville, Ind.

This note was referred to our readers, and the following answers have been received.

FROM T. H. HOSKINS, M. D.

I am asked by the RURAL to comment upon the above communication in the light of my own experience of upwards of 40 years in orchard and nursery work. Unquestionably S. B. H. is correct in reference to the importance of liberal manuring for fruit trees. It is not my experience that the application of manure or of fertilizers of any sort, will prevent the spotting, scabbing and cracking of apples subject to such defects; but without liberal manuring there is no solid success in orcharding: and a well-fed tree, even of a variety subject to the above diseases, will produce much more merchantable fruit than a neglected one of the same variety.

The method proposed by S. B. H. to start an orchard from the seed, (or from the apples) is not novel; and it is rather taking to the novice, when first suggested. There are, however, many practical difficulties connected with it, and these difficulties increase greatly the farther north the experiment is tried. Speaking roughly, all apple seedlings would be hardy (against cold) when grown south of the 42nd parallel. But not nearly all (probably not one-quarter) of the seedlings would make good trees, suitable for stocks to graft upon; and even supposing that we were sure of getting one such from every apple, the choice cannot be determined upon until all have grown so large that the rejected ones cannot be got rid of without uprooting the one chosen. The gain expected by not having to transplant the seedling is mostly imaginary. Theoretically, we might suppose it the most natural, and therefore the best way; but the immense number of very aged and yet vigorous apple trees in existence which have certainly been transplanted, and the evidence gathered from experience and observation by hundreds of orchardists on this point, ought to satisfy any one that apple trees suffer no permanent detriment by transplantation.

The better way is to plant sound, plump and well-ripened seeds thinly in drills, like peas, and care for them as carefully as for any garden crop. The best may be selected from among these seedlings at two years old; and it may be said, in a general way, that the best seedlings for orchard planting are those not of too rank or too small a growth, but such as are of a medium growth, are not disposed to make too many limbs, (which makes frequent pruning necessary,) and have a firm, healthy foliage. Do not allow these choice seedlings to grow more than two seasons in the seed-bed, but transplant them into straight nursery rows four feet apart, the trees two feet apart in the row. Here the heads are to be formed, and the great point is to allow of no forking of the trunks or branches. My preference is for three main branches, started at least a foot apart on the trunk. From each of these, the second season in nursery, three secondary branches may be started, taking the same precautions as to distance and symmetry. If the soil and care are what they should be, these young trees will be ready for transplanting to the orchard in two or three years after the first removal. The same care should follow them there; and as soon as they are again well started and growing thriftily they may be budded or grafted to the varieties desired.

The above described method requires modification in the "Cold North," where only the "iron-clad" varieties succeed. Here, the seedlings, (preferably grown from the seeds of iron-clads, though this is not essential) should grow, I think, but one year in the seed-bed, and only such as attain, at least, the size of an ordinary cedar pencil be selected, the rest being discarded. These selected seedlings I would tongue-graft at the crown with selected iron-clad cions about seven inches long, and set out, in well prepared nursery ground, so deeply that not over two inches of the cion will show above ground. The growth from these grafts should be managed and treated exactly like the seedlings, as above directed; and the young trees may be transplanted into the orchard, when they have reached a like size, to be there top-grafted to the desired varieties. There is probably some choice to be exercised in the selection of the iron-clad cions used in the first grafting, but as yet nothing very positive can be said. On general principles, making iron-clad hardiness the primary condition, I should regard a habit of free growth as generally desirable in those cions which are to form the trunk and first forks of the new tree. With this a sound, vigorous bark, that has no tendency to blight and die, either on the trunk and limbs or in the forks, is most important. Oldenburgh and Switzer seem to fill these conditions with me. For grafting tardy bearers, I find Tetofsky as a stock very satisfactory, though this variety is not entirely free from bark disease. Much is yet to be learned on these matters, for iron-clad orcharding is yet in its infancy.

I ought to add that the object in setting the iron-clad root grafts so deeply is to get roots started from the cions. This very generally takes place when Russian cions are used. Of course, the same or deeper planting must follow in the orchard, and this necessitates deep and thorough preparation of the soil, a thing most beneficial in any case, where fruit trees are concerned.

Orleans County, Vt.

FROM PRES. T. T. LYON.

Although the words *trim* and *prune* are said to be synonymous, the former conveys, to some minds at least, the idea of trimming to a single shoot—removing all side branches. We, therefore, prefer the word *prune*, which, in its horticultural sense, means to thin out superfluous shoots, to shorten or remove crossing or interfering ones, or to cut back the more vigorous branches to secure the proper form or balance of the head, each and all of which become more or less needful to the prosperity and profitableness of both fruit and ornamental trees under the artificial conditions to which they may be subjected under cultivation.

With young trees, especially of certain classes and varieties, the copious application of manures might, quite possibly, occasion excessive wood growth, and thus defer fructification, occasioning also late growths and imperfect ripening of the wood, with consequent liability to injury from the cold of winter. With older trees this danger mainly disappears, the effect being to largely increase the size, quality and quantity of the fruit. In such case excess of manure may be wasted, and there may be danger of injury from the excessive application of such as contain potash or other caustic substances.

The experiment of planting apples will not be an expensive one, and will be only likely to occasion delay, since the seeds of the apples planted are quite sure to lose their vitality before the pulp of the fruit will have sufficiently decayed to afford material to sustain the growth of the germ. Nature always provides for the separation of the seeds of fruits from the pulp before planting. This is even necessary in the case of berries and small fruits generally, even though their pulp is less in quantity and more perishable.

We can see no benefit, but injury instead, from the employment of tile to mark the position of the seed when planted. It will be better every way to use one or more short, light stakes for the purpose, since these will in no way interfere with the influences of light and moisture.

Van Buren County, Mich.

FROM PROFESSOR J. L. BUDD.

If properly understood, the plan is to plant the seed where the orchard trees are to stand, and to top-work the seedlings when large enough. In Indiana the defect will be tenderness in a large per cent. of the seedlings, and irregular growth in the small per cent. that stand. If S. B. H. will plant Gros Pomier for stocks he will find that they will start upward like young cottonwoods, and that strong, vigorous roots will go downward as in the wild crab apple. When the time comes to top-work, the stems will be uniform and straight, and the trees can be made uniform in hight and will make uniform development of stem and top. In this connection I will say that the present craze for top-working and the war on root-grafted trees are, in my opinion, not well supported by facts. At the West varieties of the apple that have good foliage and are hardy in the tops, but liable to bark-bursting or sun-scald of the stems, are benefited by top-working on stocks not liable to injury. But, on the other hand, the long list of varieties with foliage not able to endure the heat and aridity of air of our summers, and liable to winter-killing from the top downward, are not materially benefited if at all by working on iron-clad stocks. Again, such varieties as Willow, Grimes's Golden and Roman Stem, that are benefited by putting perfect stems under them, are found to ripen their fruit prematurely, if worked on such prepotent early varieties as Duchess, Whitney's No. 20, or Tetofsky. Last year Grimes's Golden on Duchess was mellow the first of October, while on Winesap it was hard and crude at that date. As to the war on root-grafting the apple, we must not forget that the Duchess is an iron-clad yet, though it has been root-grafted or crown-budded for generations. I suspect that the climatic changes in the heat and relative humidity of the air of our summers, wrought by the destruction of timber in the Eastern States, and the loss of our sea of prairie grass, and tens of thousands of swampy drainage centers at the West, have had more to do with our orchard troubles than the practice of root-grafting.

With varieties hardy enough to endure perfectly the conditions of air and soil of any particular part of our country, I truly believe, that root-grafts—with short root and long cion set down to the top bud of the cion—will make as long-lived and perfect trees as we can produce. But if wedded to the belief that top-working is best, be sure of the hardiness of your stock and that the season of its fruit is as late at least as that of Gros Pomier, Hibernal, or Recumbent.

Agricultural College, Ames, Iowa.

THE WEEPING BEECH. Winter Picture. Fig. 102.

Farm Economy.

A HOME-MADE PLANTER.

MR. C. P. TODD, of Washington County, Oregon, has sent us drawings of a planter that he made himself at a cash cost of $2. As it has saved him many days of hard work, he thinks others may like to know about it. He took the hind wheels of his wagon to which he bolted a tongue, as shown at Fig. 104. The bolt on the under side of the tongue, a larger picture of which is shown at No. 5 Fig. 105, is to fasten the plow as will be explained hereafter. This bolt came from an old plow which one of the neighbors had thrown away. At Fig. 108 is shown the plow arrangement which is fastened under the tongue shown at Fig. 104. The first shovel opens a trench. Directly back of it is a piece of stove-pipe. It will be seen that a piece of potato or a number of kernels of corn dropped into this stove-pipe must

fall in the trench behind the first shovel. Then the second shovel, bent to run at one side, will cover the seed and leave the ground smooth. The little blocks of wood in front of the strap of each shovel are used to lower the shovels or raise them as desired. They are shown on a larger scale at Fig. 105, No. 7.

Now we see how the seed is covered. How

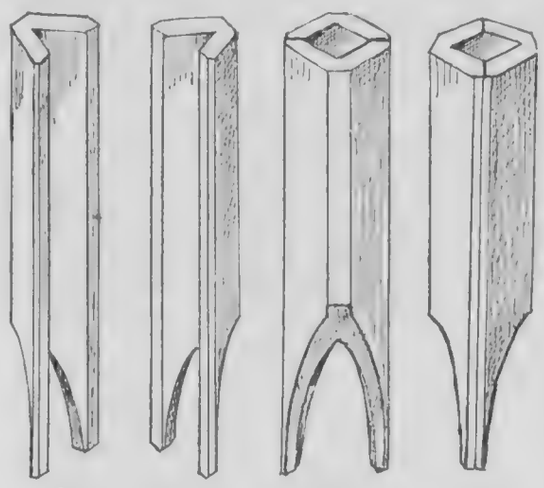

Fig. 103.

is it dropped? A frame made of plank and 2x4-inch scantling, like that shown at Fig. 106, with a better picture at Fig. 107, fits at the top of the hind wheels. The driver sits on the potato box with his feet resting on the board in front. The stove-pipe comes up through the space back of the box, and the dropper sits behind it. The inside of the potato box is shown at Fig. 109, though the stove-pipe rises higher than the cut would indicate. Now the driver starts up, and the dropper lets a quantity of potato sets

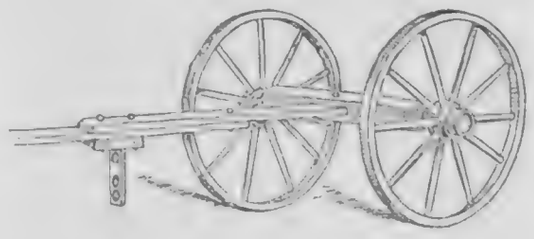

Fig. 104.

roll down the inclined boards about the stove-pipe. He drops them one by one into the stove-pipe; they fall behind the first shovel and are covered by the second. Fig. 105, No. 8, is a pole and chain used to raise or lower the plow beam. No. 6 is a clevis.

A PLANT PROTECTOR.

MR. W. B. WHITNEY, of Leominster, Mass., sends us the little device shown at Fig. 103. The pieces of wood (A, B, C, D,) are to protect from the cut-worm all sorts of plants when transplanted, such as cabbages, tomatoes, etc. The points of each half are readily pushed

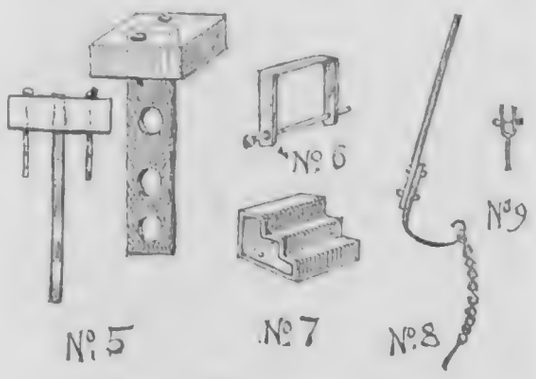

Fig. 105.

into the soil, and a little box is thus placed about the stem. Any wood, having pithy stems (such as elder) could be readily made to serve the same purpose. We have for many years used wrapping paper about the stems of tomatoes, extending it up to the first leaves, the bottom being held in place by the soil. This answers the purpose very well.

Everywhere.

RURAL SPECIAL REPORTS.

Delaware.

DOVER, Kent County, April 15.—We have had a fine spring so far, although a part of March was too wet for farmers. Plowing on high land is about all done; but in sections where the land is low and wet, very little has been done. Oats are all sown and mostly up and quite green. Wheat is growing finely, but the heavy rains of the latter part of February and the earlier part of March damaged it on low lands. Peach trees are in full bloom. Grass is growing finely; a few are beginning to pasture a little. It is the general custom here to horse-rake all grass land intended for mowing and the stuff collected is hauled into

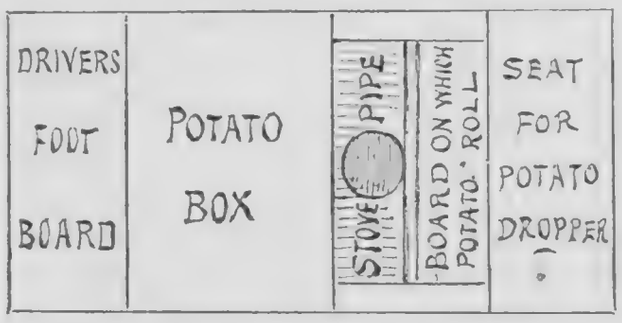

Fig. 106.

the barnyards after the spring hauling of manure. This, with surplus straw, cornstalks and any other things cleaned up from the stack yards, etc., etc., forms the foundation of the next year's manure supply. Feed is scarce and high. Corn remains low. Gardens are all made and early stuff is above the ground and growing, but it is rather too cool to be good growing weather. Corn planting will begin this week if it continues dry; but the greater part of the crop will not be planted before the last week of the month and the first of May. Hired hands get from $9 to $15 per month with board and lodging; boys from $5 to $8. Times have been dull since Christmas; but as spring advances they show improvement. If the weather continues good, the first of May will find spring work well along and the hardest over. A great many peach trees that had that dreaded disease the yellows, have been rooted out this spring. A tree once affected is never any good afterwards. A law has been passed to make it compulsory to remove all trees showing signs of the disease. If no remedy is found, it will not be many years before the peach crop will be a thing of the past with us. Nearly every housewife has her stock of chickens started; but the little fellows seem to be rather unhappy during this cool weather. If any of the readers of the R. N.-Y. who have barren grape vines, will cut off a branch of each after the sap starts and let it bleed freely, it will become fruitful—at least that is my experience with two enormous vines on an arbor. Wheat, $1 05; oats, 35; corn, 35; butter, 25 cents; eggs, 10 cents; potatoes 40 cents; fresh fish, plenty, shad at 15 and 20 cents; herring 10 cents per dozen; other fish cheaper; poultry at nine and 11 cents.

A. G. S.

Iowa.

DES MOINES, Polk County, April 15.—Our winter throughout was one of the mildest ever known in Iowa. We had but few storms, very little snow and no rain, but plenty of dusty, dry weather March weather was as fine as we usually have here in May. In the second week in April our long drought was broken by fine showers which were warm and brought up the small grains and brought out the grass. In consequence of our favorable weather farm work is well advanced and our farmers are only waiting corn planting time; for the small grains have all been sown and nearly all are growing finely. Stock can get a good living on the grass There is plenty of water for stock. Business continues very dull. It is almost impossible to part with any farm product except at ruinous prices. Potatoes are selling at 10 cents per bushel, and thousands of bushels are yet in the farmers' hands. Other farm products are about as dull. A great many potatoes have been planted; for planting them was the only way in which farmers could get rid of them, for there are not nearly cattle enough in the country to eat all on hand. Our farmers have invested largely in small fruits, most of which have been delivered and planted in good shape. Should there be no disaster to this interest, I predict that in a few years raspberries, blackberries and grapes will be as much a drug on our market as potatoes are now Very few of our farmers have much faith in apple-tree planting, though some continue to plant, and more have been planted this spring than for some years past, though planting is regarded as an experiment. The trade in garden seeds has not been so good as last season—for a great many have had all the experience they need with garden truck for some years. The early spring was too dry to risk sowing grass seed, so very little grass or clover was sown. Despite the dull times, our city continues to grow steadily and the street car and telephone lines are lengthening out daily. We have had war here between the horse-car and electric motors and the verdict seems to be that the horse-car must eventually go.

F. S. W.

HUMBOLDT County, April 20.—The RURAL improves with age. We are having a fine spring after a very fine winter. Farm prospects are all very good. Cattle and horses are plentiful, in good condition and of good quality, but prices are low. This is a good place to move to for a permanent home.

O. E. F.

Kansas.

PARSONS, Labette County, April 17.—We are just in the middle of seed-time; oats are growing finely, and wheat is all that can be desired, though a cloud of chinch-bugs was reported going to the northward yesterday. Corn is not yet up, but about half of it is planted. The ground is reported in fine condition. The season is neither early nor late, though a heavy rain this morning may yet make the time of corn-planting late, but this is not considered less desirable than an early season. Early corn-planting here may be set down for April 10, and late for May 1.

The Oklahomites are pouring along in this latitude. It is patent to all now that there is going to be the greatest industrial mob the country has ever witnessed when the gates are opened. We anticipate nothing greater or worse than some confusion and disappointment. Fortunately, the military are highly respected by the people, and are deserving of this estimation It almost seems as if the time is upon us when, as Macaulay said, the strength of the Union would be tested; that is, when the public lands should all become settled. Our people, however, can adapt themselves to new conditions in a degree that, at least once, astonished the world, and that was when the army of the Union retired from the fields of war to those of peace. It was just astonishing for the Old World to see every man falling back into his former calling just as easily and naturally as if he had been on a country jaunt. The Oklahoma country, I am told by one of the men who were surveyors of the territory, does not differ much from Kansas. There are some good lands, but the greater portion is ordinary, and some poor. Our farmers are not in a prosperous condition. Our crops last season were

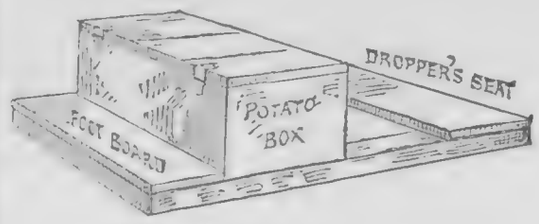

Fig. 107.

good, but low prices prevailed for corn, fruit and cattle. This was doubtless due to the vast quantity of cheap labor that is now producing cereals in South America and India, and flooding the European markets.

J. B.

New York.

JAMESTOWN, Chautauqua County, April 15—The mildness of the past winter and the early spring with its mild, pleasant weather, have brought the wheat through to this time in a very encouraging condition. Throughout Western Pennsylvania and New York I have not seen one piece that the husbandman could not look upon with pride. March was very mild and much plowing with some sowing of spring grain was done. The gardeners in and around Erie, Pa., had some of their earlier seeds in the ground before the 10th of that month. The amount of onion sets of fine quality, that are produced in the vicinity, in Erie, Fairview and Girard, Pa., is astonishing. This year the price ranges low, $2.25 a bushel of 34 pounds. Fine table onions are plentiful at 40 cents a bushel. Potatoes in Erie are abundant at 35 to 40 cents. It is difficult to find a good apple in the Erie market; while in Jamestown, N. Y., fine fruit goes begging for customers at remunerative prices. Potatoes here are of slow sale at 25 cents, and some dealers offer only 15 cents. Farmers will find more profit in feeding them to cattle and horses. Butter has started in at 25 cents; but a decline is looked for. It will be very strange if first quality dairy brings more than 17 or 18 cents and it may drop to 15 cents. The Erie market produces no prime butter; much that is offered can hardly be considered grease of good quality, and the slovenly condition in which it comes on the market is inconsistent with good dairying. The cheese is of a much better quality, but much of it is so highly colored as to be uninviting in appearance. There is a cheese on sale, the address of the maker of which I failed to obtain because the man having it on sale did not know it. It is called Illinois Schweitzer or Swiss cheese. The quality of this cheese makes it very popular with those who are fond of a sharp cheese without any of that unpleasant odor of Schweitzer cheese. This market is far in advance of that of Erie in the quality of the butter and cheese. The average farmer is growing slack in relation to his butter making. He does not work it enough to remove all buttermilk, therefore it is more susceptible of change. The season has been uncommonly favorable to the advance of spring work, most of the plowing being done and much sowing also. The warm rains have given the grass a fair start and if the weather continues as favorable as might be expected cattle will go to grass from one to two weeks sooner than last year. Hay is plentiful at $12 per ton, and feed of all kinds is reasonably low. Farm help is not in excess of the demand at from $15 to $20 a month, with board and washing. Upon the whole, the outlook

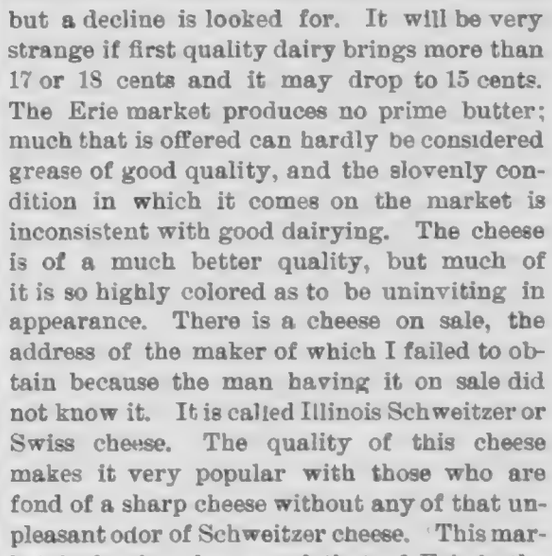

Fig. 108.

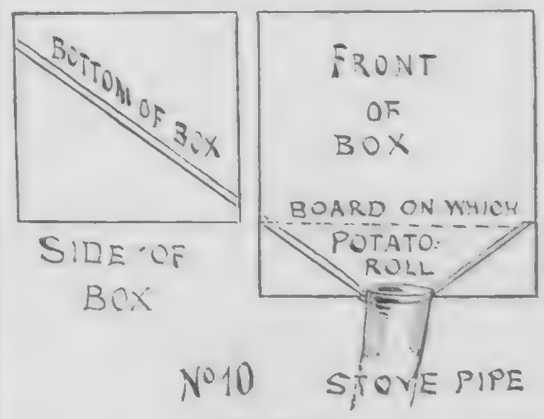

Fig. 109.

is fair for a prosperous and bountiful year. The silo question is calling forth much attention. A few who put in silos as a venture last year will increase the capacity of them, while many will build for the first time this year. A little care and a good deal of good

judgment are needed to assure success and profit. The expense attending the building can be much lessened by proper location and forethought as to material and construction.

POUNDS OF MILK TO A POUND OF BUTTER.

Several Subscribers.—How many pounds of milk are required to make a pound of butter?

ANS.—What is the length of a piece of string? There is almost as much difference in the quality of different samples of milk as there is in the length of different strings. The public and private records of famous dairy cows show some remarkable facts bearing on this point. A few weeks ago the RURAL asked its readers to test their milk. They were to weigh a quantity of milk, weigh the cream obtained from it, and also the butter obtained from the cream. Following this we have a few of the reports made in response to this request. These figures are of more importance to the farmer and dairyman than the marvelous results recorded in tests of high-priced cows. It will pay our readers to try their own cows and see if they can duplicate these figures.

FROM A. M. SHELDON.

I have two cows; one is a Devon, 15 years old, was fresh last March; the other a grade Holstein, two years old, came in in April. I weighed the milk from the two for 3½ days in the first part of January. I had 60 pounds nine ounces of milk from which we got seven pounds 10 ounces of cream which made just four pounds of butter. The milk was set in common tin pans. The cows were fed on good Timothy hay and soft corn and apples. Now who can beat that?

FROM MRS. A. A. RICE.

At the end of January, I had two grade Jersey cows which were fed upon swale hay with a ration of one quart of corn-meal and two quarts of bran twice a day and a few apples once a day, the milk being set in shallow pans. I tested 129½ pounds of milk, which gave 25 pounds 10 ounces of cream, which churned 7½ pounds of butter. Thus it took 17 and one-fifth pounds of milk for one pound of butter.

FROM R. J. RAY.

Having seen several statements in regard to yields of small dairies, I give what my six cows have done: One is two years old; two are three years old; one is four years old; two are five years old. During the past year they made 1,647 pounds of butter to sell, besides what milk, butter and cream were used in a family of four. I also fed four calves at least two weeks each on new milk. My cows are half Jersey. They had no extra feed while on grass. During the winter, I fed corn-stalks once a day, hay once a day, and four quarts of oat-meal a day and turned them out to drink once a day. They are left out awhile if the weather is warm; but if it is any way cold, they are put back in the stable as soon as they drink.

I have made one pound of butter from 13 ounds of milk during the winter. During June I made 75 pounds per week. I use a Stoddard creamery during hot weather, and barrel churn.

FROM S. D. READ.

We are milking six farrow cows—grades with some Jersey blood. I find by weighing their milk for one week, that it takes 24 pounds of milk for one pound of butter. Feed: good hay and three quarts each of bran and cob-meal night and morning with some roots. Either the feed or the cows are at fault, for they should do better. If the fault lies with the cows I shall dispose of them and get some that will do better.

MRS. O. J. PUTNAM.

Seeing a wish expressed in the RURAL that the owners of cows would try the test of weight of milk to make one pound of butter, I did so for seven days—weight of milk 59⅜ pounds; of butter from the same 3¾ pounds or one pound of butter from 15 5-6 pounds of milk. The cow is grade Jersey, five years old 23d April, 1889. She dropped her last calf May 20th, 1888. Her grain per day consists of three pints of shorts and one pint of corn-meal in one feed in the morning before she gets her hay, which consists of all the common English hay she will eat morning, noon and night. She gets water slightly warmed once a day and one gill of salt three or four times a week.

CROPS FOR FEED; DEHORNING; CAKED BAG IN A COW.

B. W. B., Saratoga Springs, N. Y.—1. I have 25 acres of sandy land, mostly in poor condition. Two acres are in winter rye and one acre in winter wheat; no grass for hay and no pasture. I want to summer and winter eight or 10 cows, and can sell the milk in the city—not over three miles distant. I have for use the manure made by eight cows and a horse since last October, but no capital to work upon. I want to make a good quality of milk. What should I do for summer and winter feeding fodder and grain? 2. I have a cow which makes too free use of her horns; how close to the head should they be sawed off? 3. I have another cow one-quarter of whose bag cakes occasionally. A few doses of saltpeter correct this; but there remains an unnatural enlargement of that quarter about two inches above the teat, and the flow of milk from that quarter is diminished about one-half; is there any way of restoring it to its natural condition?

ANS.—1. Probably the best thing to be done in this case would be to put all the land in corn—half for ensilage and half for grain. This would afford feeding enough for the eight or ten cows and give some corn for grain feeding. The land should be enriched with at least 600 pounds of a complete fertilizer per acre or our friend cannot hope for a crop that would repay the labor spent upon it. By planting early varieties of sweet corn the first feeding would come in in July, and after that is cut off, the land may be immediately planted again with a second crop as the first is removed. Forty pounds of green fodder or silage, with a peck of brewers' grains and four pounds of corn meal, fed to good cows, should make 12 to 14 quarts per day from each, and cows of less ability than that can not be fed profitably in this way. 2. Horns should be sawn off with a narrow-bladed sharp saw close to the skin and with a cut following the curve of the skull, so as to leave no protuberance. The wound may be dressed by applying common pine tar and making a mat of the hair with it, by which means the raw surface is covered and protected. 3. Saltpeter is a bad thing for cows; it has a temporary effect in reducing fever; but its effect on the kidneys is bad and causes a renewal of the fever by the reaction. Give one ounce of hyposulphite of soda daily; foment the swollen udder with hot water, wipe it dry and apply camphorated soap liniment with gentle rubbing and kneading. Use no iodine in any form, or saltpeter either. The milk may be restored in time by this treatment and by feeding bran mash once a day. Continue this hyposulphite of soda daily for 10 days.

"ONIONS FOR STOCK"—A DENIAL.

H. B. V., Westfield, N. J.—The following article recently appeared in the Husbandman. Will the R. N.-Y. tell us whether it is sensible or not? The item was written by a correspondent in Chautauqua County, N. Y.

"I noticed some time ago a letter from a farmer in Ogdensburg, N. Y., relating to onions as a feed for stock. In this section they have been used as a food for beef cattle, young stock and dry cows for years, when there was no market for them. They are considered a healthy and nutritious food. When the price of onions falls below 20 cents per bushel it will pay to feed them to stock."

ANS.—the R. N.-Y. has never had any experience with onion feeding for stock, except a strong effort to keep milch cows from eating them. This letter was referred to the R. N.-Y.'s friend, Mr. H. A. Whittemore, who has lived for many years in Chautauqua county. Here is his answer.

Mr. Whittemore says:—"I am well aware that sometimes cattle will crop onion tops when they get near them; but in over 45 years' experience and observation, never have I known of onions being fed to any kind of stock either as a relish or a ration. Never since I have had any knowledge of farm crops or the markets for farm produce, have I known onions to command less than 40 cents a bushel; the usual wholesale price has varied with grocerymen and consumers from 75 cents to $1.50 and sometimes $2 a bushel. Chautauqua county soil is tolerably well adapted to the culture of onions, and sometimes produces tolerably heavy crops; but I think it will puzzle this correspondent or even the oldest inhabitant to mention the year when the price of onions fell to or below 20 cents a bushel. I must say that I would not criticise any man's intentions in airing his opinions, but I do question the knowledge of any man in Chautauqua county, N. Y., who says he knows of onions being raised as food for stock—or who says that the price of onions has ever fallen below 20 cents a bushel. In the southern and eastern parts of Chautauqua county the average farmer does not produce over from two to six bushels of onions a year. A few market gardeners may have from half to one acre. In a day's ride anywhere in the towns south of the *ridge*, one will find scarcely an onion bed measuring one-sixteenth of an acre. 'Onions for stock!'—the notion is too absurd to need farther comment."

If any of our readers have other facts to present, we want them.

CHRONIC COUGH IN A COW.

J. H., Fulton, Mich.—1. My horse is apparently perfectly healthy. He is sleek and fat. An hour after putting him in the stable after a drive, I find a place about as long as my hand, just below the whirl-bone quite wet and it remains so for five or six hours. What should be done? 2. A heifer came into the stable in fine condition last November. Towards the end of December I noticed that her eyes were much swollen and watery. I gave her three doses of aconite at intervals of four hours. On my return after a week's absence, I found her eating well but coughing. A veterinary surgeon said the trouble was caused by her liver, and ordered aloes. The dose was followed by mandrake root. No relief; and she gradually ran down. She is now in calf. She eats a little shorts and relishes carrots. There is a rash all over her body and legs. Bathing with Pond's Extract soothes, but doesn't cure. Her lungs seem much better than some time ago and her pulse is lower; but she still coughs and has no appetite. She stands with her head slightly elevated. What can I do for her?

ANS.—1. Rub occasionally with iodine ointment. 2. Give the cow one pound of Epsom salts and one ounce of ginger dissolved in a quart of warm water, as a drench. For the cough mix one table-spoonful of pulverized nitrate of potash and 25 drops of tincture of belladonna with sufficient honey or sirup to make a thick paste. Give this dose two or three times daily by pasting it well back on the tongue and back teeth to be swallowed slowly. Also rub the throat with a good liniment. For the general system, give two table-spoonfuls of the following powders in the feed night and morning: Carbonate of soda and Glauber salts each one pound, sulphate of iron one-fourth pound, mix. If the cow comes fresh and the cough continues, we would advise you not to use the milk at present for family purposes. It may be a case of tuberculosis in which case it would be unsafe to use the milk. If there is no marked improvement in three or four weeks, have the cow examined by a competent veterinary surgeon to ascertain the presence or absence of tuberculosis. If the cough ceases, however, and there is an improvement in the general health, the milk may then be used.

CHRONIC COUGH IN DAIRY COWS; CRIB-BITING.

F. H. W., Auburn, N. Y.—1. I have a dairy of 20 cows, most of them in milk. The past winter some of them commenced to cough and they seem to get worse; it is a dry cough and seems to affect most of the cows that are heavy with calf. I am feeding beets with corn-meal and bran mixed. The cows are in a warm stable. What should I do? 2. Is there any cure for a horse that has just commenced to crib?

ANS.—1. The cough may be the result of colds or exposure during the winter or may be due to disease of the lungs. Apply to the outside of the throat of each coughing cow a liniment of equal parts of raw linseed oil, aqua ammonia and oil of turpentine. Apply this twice a week until the skin is slightly blistered. Also make a paste of one table-spoonful of pulverized saltpeter mixed up in honey or sirup, and add 25 drops of tincture of belladonna. Give this dose two or three times daily to each cow, by placing it well back on the tongue to be slowly swallowed. If there is no improvement after two or three weeks you would do well to have the cows examined by a competent veterinary surgeon for tuberculosis. 2. There is no satisfactory treatment for crib-biting. Various methods are practiced to prevent the habit, some of which are very successful. One of the simplest by which some cases may be checked is to cover the exposed wood-work with a thick, sticky paste containing some very disagreeable substance, as aloes, turpentine or kerosene oil. Spanish flies are sometimes used, but these will blister the lips and tongue and should be used cautiously. Another method is to cover all the wood-work within reach with sheet iron. Some horses will not crib on the iron sheeting. A muzzle to be worn when not eating will effectually prevent cribbing while worn. One of the most practical methods is to tie the animal at a high side wall where there is no exposed wood-work upon which the horse can crib. In this case feed must be given from the floor or a shallow manger below the knees.

PARTIAL LUXATION OF THE PATELLA IN A COLT.

J. S., Center Hall, Pa.—When my 21-months-old colt was about six months old—a few weeks after I had bought him—I noticed that the patella of one leg would slip out when he was running about or when he threw a good deal of his weight on that leg, causing him to limp while it was out. The trouble has continued right along. After standing a little the part slips into joint again of its own accord. There has been no swelling; but there is a soft, pulpy place on the patella. I think the trouble is hereditary, as a considerable number of the progeny of the same stallion are affected in the same way. What should be the treatment?

ANSWERED BY DR. F. L. KILBORNE.

This partial luxation or slipping out and in of the patella is not of uncommon occurrence in colts. It is usually due to a sprain or other injury, which often passes unnoticed, but there results more or less inflammation followed by relaxation of the ligaments which hold the patella in place. With the several colts you mention as being similarly affected, I doubt if any special tendency to this luxation of the patella is inherited, any further than that they are naturally weak, at least in the stifle joint, and the luxation is the result of some trivial cause that in a stronger colt might not have produced any effect. In many cases the colt will outgrow the trouble without treatment; but it is better to stimulate the ligaments to contraction in order to keep the patella in place and strengthen the joint before the trouble becomes too chronic. For this purpose apply a cantharides blister over and around the joint. Powdered cantharides two drams, vaseline one ounce, spirits of camphor 10 to 15 drops. First clip the hair and then apply the blister, following the directions and precautions frequently given in these columns for blistering. A second blister may be desirable when the effect of the first has nearly passed off, if the luxation has not been entirely reduced.

WATER-CRESSES.

G. S. J., Newtown, L. I.—1. On what kind of bottom do water-cresses thrive best? 2. How can one get rid of what is here called. "duckery"—a parasite that feeds on or smothers the cress? 3. How can snails in the cress beds be killed without injuring the cress? 4. Should cress be covered entirely with water throughout the winter? 5. Is there any work on growing water cresses.

ANS.—1. A gravel or hard bottom. Water-cress does not thrive well in a mud bottom; besides, a mud bottom is a hospitable breeding and feeding ground for cress-destroyers, both animal and vegetable. 2. You probably mean duck-weed (Lemna.) It smothers (not "feeds upon") the cress. In order to be able to grow water-cresses with good success you should grow them in a brisk, shallow stream; then you would have very little trouble with duck-weed, as the current would float it nearly all away; but without this brisk current you cannot well get rid of it. 3. Not very well. Here again you will perceive the advantage of a brisk current of water, also of thoroughly cleaning out, regraveling, and replanting the beds once a year, say, in September. Considering the fact that water-cresses grow wild and luxuriantly as permanent plants in some streams, so much trouble to cultivate them artificially may seem unnecessary, but it is an easy job and pays for doing, especially when one has such pronounced evils to contend with as appear in your patches. 4. Water-cress is hardy and will survive the winter even if it be not covered with water, but it is usually covered with a greater depth of water in winter than in summer. As it inhabits running rather than still waters, however, it is seldom frozen in winter. The particular thing to guard against in winter is letting it freeze to the ground, and then have a freshet come and raise the ice and with it the cress plucked out by the roots. 5. We do not know of any.

LAMENESS IN FRONT LEG OF A HORSE.

H. B., New Albany, Ind.—Within two weeks after I began to work a fine young horse I bought last September, what I took to be a wind-gall appeared on his left front leg just above the pastern joint. About January 1, he began to show weakness there, resting that foot frequently by throwing it out in front of him. I bandaged it, applying tincture

of arnica. The puffs or galls disappeared, but after a while they returned. I then discovered fever in the back part of the leg just above the pastern, but there was no heat in the front. I blistered with Gombault's Caustic Balsam four times, the fever returning after each operation; though not for a time after the third blistering. I have just blistered him again, and the wind puffs have disappeared. What should be the treatment?

ANS.—The treatment you have given was good, but evidently not thorough enough. Poultice the foot for three days with ground flax-seed, changing the poultice once daily. Then wash off, rub dry, and cover the whole hoof with a hoof ointment of equal parts of pine tar and vaseline melted together. Use an old paint brush or a shoe-blacking dauber, and apply this ointment to the hoof once daily for several weeks. As soon as the pastern is well dried after removing the poultice, apply a cantharides blister to the front and sides of the whole pastern—powdered cantharides two drams, vaseline one ounce, spirits of camphor 10 or 15 drops. First, clip the hair short and then rub the blister well in for 15 minutes. When the blister is well raised—requiring about 24 hours—wash off with warm Castile soap-suds, after which anoint once daily with vaseline. Do not forget to tie the horse's head well up so that he cannot reach the foot with his mouth and blister lips and tongue.

THE STRAWSONIZER.

R. B. K., Grand Rapids, Mich.—In some English papers I see accounts of a new machine called the "Strawsonizer." What is the machine and how does it work?

ANS.—The "Strawsonizer" is a machine for distributing chemical fertilizers, poisons, sand, deodorizers, etc., etc., or for sowing grain or other seeds. It was invented by an Englishman Mr. Strawson, hence its name. The following description writtten by Prof. Fream, gives one a clear idea of the machine and its manner of working. "Imagine a light cart on a pair of wheels. It is easy to conceive how, as the cart is drawn along, the revolutions of the axle may be communicated, by chain-gearing, or similar means, to any other body capable of turning round its axis, and that the revolutions per minute of the latter may be increased a thousand-fold or more. Suppose a fan is thus made to revolve on its axis, there will be considerable commotion in the adjacent air. If this fan is adjusted to work inside a horizontal tube, the axis of the fan extending diametrically across the tube, a furious blast of air will be driven out at the end of the tube so long as the cart continues to travel. Further, it is perfectly easy to understand that at the end of the tube whence the powerful air-current issues horizontally, another tube may rise vertically, and if this leads up into a hopper in which any material, solid or liquid, is carried, it must follow that when the cart is in motion the material, as it descends from the hopper down the vertical tube, will, when it crosses the sectional area of the horizontal tube, be suddenly subjected to such a blast as will send it flying right and left and backward, but, nevertheless, in style at once regular and uniform."

KEEPING POTATOES IN COLD STORAGE.

L. B. J., Hillsdale, Mich.—On page 288 of last year's RURAL somebody gave a short account of some experiments with seed potatoes kept in cold storage by the Hornellsville farmers' club. I would like to know how the experiment came out. If potatoes can be kept in cold storage and thus prevented from sprouting until ready for planting, it will be a great boon for potato growers.

ANS.—Mr. C. C. Thatcher, the Editor of the Farmers' Club Journal, sends us the following report of this experiment:—The question whether cold storage is a success for the keeping of seed potatoes is not decided beyond a doubt. The seed stored in 1886 kept until the spring of 1888; but none grew. The potatoes looked as hard and perfect as ever, but on being cut open they were black inside and their vitality was gone. We can only judge that so long a storage at almost the freezing point gradually kills the germ of the potato. For seed to be sent to Bermuda, Early Rose potatoes were put in the store-house in March last year and kept until August 1st; then shipped. They were 30 days in reaching their destination, and of course had commenced to sprout. The yield from them was not equal to the native potatoes, yet the same parties are going to try the experiment again. It gives them at least an opportunity to get American seed, which is quite an advantage. Experiments are still being tried, such as putting seed in storage about April 1st to be held for the first of June planting. So far such retarding of sprouting has not proven an advantage; the cold is too near the freezing point for potatoes, except to keep them fresh for eating.

ANGORA GOATS AS PROTECTORS OF SHEEP FROM DOGS.

L. G., Union Village, Ohio.—It is claimed that Angora goats will keep dogs from a flock of sheep: what does the RURAL know on this subject, and if so where would be the nearest point to purchase full-bloods, and what would be the probable price?

ANSWERED BY MILLER & SIBLEY, FRANKLIN, PENNSYLVANIA.

We have a lot of pure-bred Angora goats—probably the largest strictly pure flock in America. The nannies will not always protect themselves against dogs. They have to be looked after when the males are removed, but the males are very combative and will hold their own against any dog. They are inclined to stand their ground and fight it out for the rest of the flock. We have never kept them with sheep, but are informed that the practice is to allow one or two males to run with the flock of sheep and that where such a practice is followed there is no danger from dogs. We have further been informed by those who have kept Angora goats with sheep that there is no danger whatever in permitting goats and ewes to run together as they will not breed together. For a choice-bred Angora our price is $25.

ABOUT POTATO GROWING.

S.S., Yorkville, Ill.—I have an old cow pasture and an old hog pasture both fall-plowed and in splendid condition this spring. Which would be best for potato culture? I have the Early Ohio and Charles Downing for early; the White Elephant for intermediate, and Burbank for late potatoes, the last three being new varieties to me. Which is the most productive? Would leached wood ashes and unleached cob ashes be of use as a fertilizer? I furrow my ground for potatoes with a two-horse cultivator, setting the outside shovels the right distance apart, and go twice in a row, dropping the seed pieces 12 or 14 inches apart, stepping on each piece and covering them with the cultivator.

ANS.—The R. N.-Y. would choose the hog pasture, all else being equal. We would choose the Charles Downing for early, unless the *earliest* potato were desired. Then we would choose the Early Ohio. Burbank might well be chosen for *yield*. The White Elephant is better in quality. Yes, the ashes (both leached and unleached) will, no doubt, help the crop. We should *avoid* stepping upon the seed pieces.

CRIBBING MARE OUT OF CONDITION.

S. A. V., Clyde, N. Y.—I have a young mare that will eat but very little hay or grain and as soon as she is worked or driven she falls off in flesh. Still she appears to feel well, her coat looks good and so does her countenance. She cribs somewhat on coming into the stable after being driven. What is the matter with her and what should I do?

ANS.—The falling off may be due to indigestion from the cribbing. Try the following powders:—Sulphate of iron one-fourth of a pound, powdered gentian and ginger each one pound, mix; dose: two table-spoonfuls night and morning in the feed. Omit this powder the second and fourth weeks and, instead, give one tea-spoonful of powdered nux vomica for the first three days and two tea-spoonfuls the rest of the week. For prevention of cribbing, see answer to F. H. W. elsewhere in this department. If there is no improvement after three or four weeks, treat for intestinal worms, as advised in the Farmers' Club in the RURAL of May 12, 1888.

WALKS IN A COUNTRY LAWN.

E. P., Chatham, Pa.—What is the best and most durable material for walks in country lawns, and how should they be laid?

ANS. It is best for durability either to use gravel (by which we mean small, roundish, granite stones found near the seashore, etc.) or to macadamize the walks. For the latter purpose, various kinds of rock are broken up by machinery and sold at prices varying with the supply and demand. The R. N.-Y. has been macadamizing about 125 feet of carriage-road and paths. The earth was dug out to the depth of a foot. The bottom was paved with stones of various sizes as gathered in the fields, using the larger ones in the bottom and filling in the spaces with the smaller. Then two inches of sandy earth are evenly strewn over this, and finally two inches of the crushed stone spread over all. This makes in time a perfect road or pathway.

LUMP ON JAW OF COW.

W. K., Ontario, Kan.—There's a lump on the neck of a six-year-old cow near the jaw-bone. It isn't soft, but it causes her to wheeze in breathing, especially in wet damp weather. A veterinary surgeon said it was quinsy and gave me some remedies, which have done no good. She has been in this condition since she was 2½ years old. In other respects she is in good health and fine condition. What is the trouble?

ANS.—A personal examination would be necessary to ascertain the nature and cause of the lump, which from your description, may be due to any one of two or three causes. Try painting it three times a week with compound tincture of iodine. Clip the hair as short as possible, rub the iodine well in and continue the applications until the skin is quite well blistered. It is not quinsy.

CATTLE SHEDDING THEIR HORNS.

C. E. H., Detroit, Mich.—Up in Minnesota, from December last until March 1st, I wintered a herd of about 30 head of cattle, consisting of cows, heifers and steers, feeding nothing but oat-straw. The cattle were warmly housed and regularly watered. They seemed to be healthy and in fair condition. Lately three or four cows are losing their horns. The horn decays about the root and drops off. The other animals are in a healthy condition, and so are these with the exception mentioned. The affected animals will all calve soon. Why are the cattle losing their horns?

ANS.—The shedding of the horn is probably due to injury or freezing. As soon as shed, the core should be lightly wrapped in the best pine tar. A new horn will soon grow.

CHRONIC COUGH IN A STEER.

C. P. P., Stafford, N. Y.—My yearling steer has had a cough for several months, probably from taking cold. His appetite is good, but he continues to grow poor. In other respects he seems all right. Is there any remedy?

ANS.—Mix one table-spoonful of saltpeter and 25 drops of tincture of belladonna with sufficient honey or sirup to make a thick paste. Give this dose three or four times daily by placing it well back on the tongue and back teeth to be swallowed at leisure. Apply ammonia liniment to the throat twice a week. If the bowels are not moderately loose give one-half pound each of Epsom salts and common salt as a drench dissolved in one quart warm water.

PLANTING POTATOES LATE.

S. M. R., East Jordan, Mich.—I sowed 10 acres of rye early last fall with the intention of plowing it under the first of June, and planting the ground to potatoes. Would it be advisable to do so, and how should I plant them? Would it be a good idea to drop them in every third furrow?

ANS.—The R. N.-Y. cannot give advice on this subject, and would be glad to hear from others. Our experience with late-planted potatoes has always been against the practice. We should suppose that rye or any other green crop turned under in June would render the ground excessively dry, unless, as is not usually the case, June, July and August should prove to be wet.

CRIBBING.

W. A. F., Homewood, Pa.—I have a valuable young mare that has been sucking wind or cribbing of late; what is the cause and what can be done for her? Would it be advisable to breed from her?

ANS.—It would not be advisable to breed from such a mare. Neither should she be allowed to stand by or run with other young horses. They sometimes acquire the habit by imitation—*i. e.*, acquire the habit by standing near a cribber. For treatment and prevention, see answer to F. H. W. above.

PAINT FOR TREES.

L. M. W., Shelbyville, Ill.—Will young trees be injured by soft-soaping or painting them? What should be the color of the paint used?

ANS.—Soft soap should be diluted. It is well to mix the soap with a light white-wash, coloring it with red mineral paint and lamp-black to imitate the color of the bark. Paint should not be used, although a band about the lower part of the tree serves to repel the borer.

Miscellaneous.

H. M., Saltillo, Mexico.—We should say that the Acme harrow would suit you.

A. H., East Orange, N. J.—The magnolia flower sent for name, closely resembles that of Magnolia stellata.

F. S., Ithaca, N. Y.—What is the relative value of Shropshire, Oxford, and Hampshire Down sheep for farmers in Central New York, who usually keep small flocks well? What would they cost?

ANS.—There is so much similarity between these three breeds, all having their best points through South Down crosses originally, that there is not much choice between them. The Shropshire is the most popular of the three, and is a good enough sheep for any farmer to keep. The common price of all of them is about $10 each for pure-bred ewes, and $15 to $30 each for the best rams.

J. M., Leigh, Neb.—My two-weeks-old colt is beginning to eat a little hay. I noticed yesterday that he passed no dung, but the passage was filled with it as far as my finger could reach. It was cleaned out but is just as full to-day. It doesn't seem harder than ordinary horse manure; but it is very dark and emits a very offensive odor. I gave an injection of soft water and soap, but it had no effect. What should be done?

ANS.—The colt should have received two ounces of castor oil, followed by frequent injections of warm Castile soap-suds, until a free evacuation of the bowels had been obtained.

E. A. R., Rockland, Ind.—1. How much hen manure should be used in a hill of corn? 2. Should it be put in the bottom of the furrows and a layer of soil be placed upon it before planting the corn? 3. Would corn raised about 80 miles north of this place be suitable here?

ANS.—1. Of pure hen manure use one handful to the hill and *mix* it with the soil of the hill. 2. We would *mix* it with the soil of the bottom of the furrow, raising it somewhat above. Then cover and plant. 3. There is no reason why it should not; but one should not trust a large area to an untried variety.

J. C., Monroeville, Ind.—In November, 1887, I bought a pedigreed Holstein-Friesian bull calf, duly registered in the Holstein-Friesian Herd Book. Why do all his calves come red? There isn't a black hair among all his progeny.

ANS.—We suppose these red calves are from native cows and not from cows of the same breed as the bull. A pure-bred bull may not always get calves like himself from native cows, but usually the calves should have some likeness to the bull if he is a good one. The explanation may be that the bull is too young to make a decided impression upon the calves, or that he may have been overworked, and his vigor reduced. Wait another year.

D. R., Bernardsville, N. J.—1. For a hay crop, how many pounds of clover and Timothy seed should be used per acre? 2. How can I learn the number of acres, in fields that are of all shapes from square to triangular? 3. How many bushels of oats should be sown to the acre in this section? 4. How many tons of city manure should be applied per acre on rather poor land, to insure a good corn crop?

ANS.—1. Sow 12 to 15 pounds to the acre of Timothy if sown alone for hay. When no grass seed is sown, from 10 to 20 pounds of clover are sown. Much depends upon the preparation and fertility of the land. The more seed sown, the smaller and weaker will be the individual stems. 2. We should require to know the exact shape. If square, multiply the length of one side by that of the other. So, too, if the angles are right angles, the length by the breadth will give the area. There are 43,560 square feet to the acre. 3. We prefer to sow from 1¼ to 1½ bushel on fertile land. Some varieties of oats tiller more than others and less or more seed is required. 4. We should not use, to *insure* a good corn crop, less than 30 tons to the acre. Had it been applied in the fall 20 tons might have answered as well. Horse manure is very slow to yield up its plant food.

DISCUSSION.

RAISING BEANS WITHOUT POLES: GROWING SEEDS IN THE SOUTH.

A. W. S., AMERICUS, GA.—After reading the article of E. T. Ivey on "Raising Lima Beans without Poles," I must dispute his claim to originality unless he commenced more than four years ago. Four years since I adopted the method except that I used posts six by six inches, 12 feet long, of which four feet were put in the ground. The posts are set 75 feet or more apart with No. 8 galvanized wire for the top and No. 15 for the bottom, about six inches from the ground. I would suggest the latter distance, for when the vines do not have the bottom wire to steady them they frequently break the string, or else they are damaged by the winds whipping them about, both of which mishaps the bottom wire by its steadiness prevents. This year I will use this plan for the growth of different varieties of Moon-flowers, cobæas and other climbers: about 20,000 feet of No. 8 wire for the top. I shall use besides, No. 15 for the bottom, and I shall discard strings, substituting No. 20 wire. I find that here too many strings break if we have wind before the vines reach the top wire and

"Herbrand" Fifth Wheel for Buggies.

damage the vines badly, delaying blooms and diminishing the crop of seed.

I do not know who "Anon" is, but I have read with interest his successive articles on the seed business. What he states as to seed grown South is correct. For earliness we should send North for certain seeds, but I know that in case of the majority of seeds, such as beans, squash, cucumbers, melons, lettuce, okra, etc., our home-grown kinds will produce double the quantity and a much finer quality than Northern-grown seeds, but they will generally be later, except as to melons. The finest cabbage seed I ever saw, I grew myself on St. Lucian's Island off the coast of Georgia, and I never saw finer seed or any as plump from any house North. While the above is true as to the excellence of our Southern-grown seeds, yet I prefer to have less desirable seeds than to grow any on my place that have to pass the fall and winter, as such plants tend to cause an increase in a wonderful degree of the various destructive insects which prey upon young vegetation in the spring. His remarks as to water-melon seed are true in all respects. Many thousand pounds are grown in Georgia for shipment to the North. One seed house, in writing to me, admitted that as the water-melon here reached its highest perfection, so the seeds were correspondingly perfect; but that they were too plump, and that they preferred having them raised nearer home where they weighed less and numbered more to the pound. "Anon" is again correct in saying that the best seeds can be obtained only where the vegetables or fruits grow most perfectly. As the mining interests are bringing millions into this State and Alabama for investment so, 20 years hence, a large proportion of seeds and plants will be grown in the South. But for excessive express charges we could even now grow and ship many plants at one-tenth of what Northern florists must charge to live.

AN ORIGINAL POTATO CONTEST.

J. V., VOAK, YATES COUNTY, N. Y.—Last spring the wife of the pastor of our Methodist church proposed a new plan for increasing the funds of our missionary society. She suggested that each member should select one potato, plant it, measure the yield, and sell the product for the society's benefit. One member of the church increased the interest by offering a prize for the greatest yield from one potato. Thus came about our "contest."

At the time of harvesting, the potatoes were gathered and taken to the church, where a committee appointed for the purpose, received and weighed them, and decided who was entitled to the prize. The potatoes were then sold. At the time of the gathering and the decision of the committee, there was held at the church what was termed a "Potato Supper." Everybody was invited. The "supper" and the social were the fine things about it.

Now as to the yield of potatoes: 21 persons competed for the prize. The yields varied from 14 to 86 pounds from one. The premium lot was raised and presented by Miss Dora B. Slaughter, assisted by her grandfather now 80 years old The weight of this lot was 86 pounds. One large potato was selected, the largest they could find, and planted in the garden, previously well and thoroughly manured with barn-yard manure. The potato cut to two eyes to a piece made 11 hills which, less than four feet apart, occupied 28 feet. The culture was about as usual. They were hoed twice, the hills were broad and flat; the bugs were kept off, and they were occasionally watered during the dry time. The potatoes appeared to be not quite matured, as the skin rubbed off some in handling. I think it probable that they would have weighed more if left in the ground until thoroughly ripened.

Another young lady presented the next highest lot, 68 pounds. Two boys presented each 57 pounds, another 53, and two little girls 37 and 44 pounds respectively.

The yield per acre of the lot that took the prize as figured by some, would be 740 bushels; another made it at the rate of 743 bushels, and another expert at figures put it at 732 bushels 26 pounds. The last was estimated on the supposition that the hills were three feet apart each way.

I will ask the smart folks of the RURAL NEW-YORKER how they agree with our figures on it. I think there is no doubt but that the yield per acre would be quite satisfactory to most, if not all farmers. If by the RURAL'S Trench system that amount can be doubled, and all would adopt it, what would be done with the potatoes? Thus it appears that the RURAL is likely to be beaten by a school girl of Yates county, New York. But let me say to the young men that there is no use in their getting out and dusting their best store clothes, and starting after this young lady. Just wait. Don't let any one bother her while she is at her studies. I might say, however, that she can make bread and cook and keep house as well as raise potatoes.

NORTHERN SEED-CORN IN THE SOUTH.

J. P. A., TALLAHASSEE, FLA.—Is not the belief expressed by Mr. A. C. Glidden, in a late RURAL, to the effect that "corn has no characteristic of value that will bear transportation across one degree of latitude and remain," a little hasty? It may be true in regard to varieties taken from the South towards the North, but it is certainly not true when they are moved from the North southwardly. This section annually imports considerable quantities of corn from Maryland to be planted here for an early crop, to come into use before the native kinds are available, and it always succeeds well. My experience with seed from the North is that it generally does well and is early. There is one drawback, however, and it is a serious one—such corn is much more liable to the attacks of the weevil than that generally raised here. Out of some corn sent from the RURAL NEW-YORKER a few years ago, as the result of crossing 50 different varieties, I selected two kinds from the yield of the first year. These were both white—one having a very small stalk, bearing three to five small ears, and very early; the other having a large, vigorous stalk, bearing one or two large, fine ears, but somewhat later. These were planted together, and the cross resulted in something about half-way between the two, giving good-sized ears, two or three to the stalk, and being nearly as early as the earlier of the parents. This has proved about as early as the Maryland corn and seems a valuable variety. I have had the same difficulty with it with regard to the weevil, however, and this year very narrowly escaped losing the seed from this cause. The Maryland corn is so readily eaten by the weevils that if left too long in the field it will sometimes be found completely riddled before it is gathered. Mine shows no sign of the pest until it has been gathered some weeks.

WHEN FRESH MANURE IS NOT SERVICEABLE.

A. B. A, FLUSHING, L. I.—In the RURAL of March 30, page 316, is the following, "We doubt if fresh farm manure is to any great extent serviceable to the corn plant, when applied in the spring." The term "farm manure," as used above, I suppose means the same as stable manure. If so, then I will say that its value in the spring will depend much on the nature of the soil to which it is applied. On a stiff clay, unless the season after planting proves quite wet, I do not think it will be found of much benefit, and one must wait for good effects from it till the following winter has rotted and pulverized it for the succeeding crop. But for years past I have applied fresh stable manure to my crops of corn, potatoes, etc., planted from early spring to late summer. Along side of these, well rotted stable manure was occasionally used, and I could never see any difference in the crops, unless the season happened to be particularly dry; then the rotted manure proved much the more beneficial, and especially so, if it had been made up into a compost with muck, turf, or vegetable matter. Considerable loss is annually sustained by the improper use of fertilizers, and particularly of those called "commercial." If applied to hoed crops, much of their substance seems to be easily dissolved, and leaches below the roots of the crops, and is thus of little or no benefit to them. Such fertilizers ought to be applied broad-cast early in the spring to grass, wheat, rye, oats, and any other small-grain crops; also in small quantities directly around the plants of hoed crops soon after they have come up, and again perhaps when partially grown. They are of special benefit to corn after silking, when the ear begins to form.

GAS-LIME FOR CHINCH BUGS.

L. C. W., ROGER'S PARK, ILL.—A late RURAL contained a communication from J. R. H., Wellsville, Kansas, on chinch-bugs. I saw in a paper a few years ago, a statement by a man in Ohio to the effect that for an experiment he had sowed gas-lime on a field of wheat, and the bugs did not hurt it; while a piece adjoining it, not so treated was completely ruined, so I thought I would try the plan. It worked splendidly. My brother had a piece adjoining. The pests ravaged his, but did not hurt mine a bit. I got 20 bushels of very nice plump wheat to the acre, while he got only about 12 bushels of poor stuff. If J. R. A. lives near gas-works I would advise him to try gas-lime. It is the refuse left after the lime has been used in purifying the gas. As a general thing, it is given away in order to get rid of it. It is rather nasty to handle; but it does the business. It must be sowed when the grain is three or four inches high or before the bugs begin to work.

R. N.-Y.—A word of caution about the use of fresh gas-lime is not out of place here. When fresh, gas-lime contains sulphuretted hydrogen and other sulphur compounds which are poisonous to vegetation. These compounds are, however, rapidly changed by oxidation into harmless if not useful substances, leaving the lime in the condition of carbonate, or mild lime, with some sulphate. In this condition it is beneficial; but two or three months' exposure to the air is needed to produce this effect, so that if the gas-lime is fresh it would be unsafe to use it before "weathering."

A TREE WITHIN A TREE.

W. B. P., PRATTSBURG, N. Y.—A neighbor cut down an apple tree that was planted 80 years or more ago by his father, and had attained a diameter of 22 inches at the base. In working it into stove wood he found in the center of the trunk of the tree the perfect twig as originally pruned and set. It was three feet high, the short stubs of the side limbs and the two longer ones left of the forked branches of the young tree at the top, were all as distinctly defined and perfect as when the tree was planted. In the adjacent wood were all the angles, bends and indentations that the twig made, and although snugly imbedded, there was no actual connection, a section of the twig falling out when the encasing block was split. There was as much appearance of life in the twig as in the surrounding wood, and but little in either, for the tree was old. Was it an anomaly? How would the matter be explained by those who have made a study of all the mysteries of tree growth?

RIDGES FOR MANGELS.

E. A. McC., Emporia, Kan.—I don't know but Geo. Atkin is right in what he says in a late Rural on ridges for mangels; but I would not take his "say-so" for two acres. I suggest to L. B. S. who inquired about the matter, to try both level and ridge culture. I planted my beets with a wheat drill 40 inches apart and ran a wheel over each row, which left a slight furrow. When the beets were up I worked the soil to instead of from them. I used no manure: the land was medium, the season very dry, but I harvested 1,400 bushels of sugar beets per acre.

MULCHING WHEAT.

J. W., LODI, OHIO.—I mulched 7½ acres of wheat the first week in January with straw and clover haulm, and it looks well now. The stand is good. The wheat on parts of the field where the crop always froze out before stands well now. From present appearance I have every reason to expect a large crop.

W., TYRONE, PA.—The potato has always been a sort of Proteus among our crops. It defies all attempts to lay down rules for its culture. As far back as the days of that first agricultural editor, Arthur Young, who had General Washington for a correspondent, we see the same inquiries and the same differences of opinion on points of treatment, that are found to-day. A Montreal correspondent in a late RURAL, speaks of sawdust as tending to induce scab. Now, my accidental experience last season was that the only quite clean and smooth potatoes that I had—in heavy loam mulched, but without the use of any fresh manure—were where sawdust, used as a mulch for raspberries, had rolled into the furrow so that the young potatoes were found bedded in it under the soil covering. They were so fair and handsome that, although the result seemed quite unaccountable, I resolved to make a special trial of a sawdust bed for the tubers next year.

MRS. E. A. F., HANCOCK, VERMONT.—I measured my potato contest plot on April 13. The snow is not all gone yet so I could not measure very correctly. It is about 70 feet long and 30 feet wide. The bright new leaves of the pie-plant were pricking up through the edge of a snow-bank to get a look at the sunlight. How would my Southern sisters like this prospect for raising a prize crop of potatoes? I intend to do all the work myself except plowing and hauling manure and trenching. I intend to try the Trench system and show the farmers in this section how to raise potatoes. I have been reading the instructions to be observed in the contest and also the criticism and noticed how much the Editor of the RURAL has to contend with. How selfish we poor mortals are! But our RURAL Editor has a mind of his own, and every part and particular point of the potato contest will be conducted in a fair and impartial manner.

A. J. A., CHESHIRE, OHIO.—The amount of foul grass seeds put on the market is not complimentary to the intelligence of the average farmer. Dealers know by experience that many farmers do not know plantain and other noxious seeds, or they would not continue to handle such seeds as one finds exposed for sale everywhere. I suggest that there should be an official inspection of all seeds put on the market, and that all foul or worthless seeds should be condemned. This inspection might include the stuff sent out by the Washington Seed Bureau.

What Others Say.

SPIRIT OF THE PRESS.

THE Darnell's Patent Furrower is a simple and very useful implement. At the end of two short runners are two round disks which make the drills or furrows. The disks are then reversed and the seed is covered. The distance apart may be adjusted as desired. The draft is very light; the implement so simple that there is nothing to get out of order..

THE Cutaway harrow is being used in some new land full of briars (Smilax) with great satisfaction. This harrow is destined to be used by all progressive farmers simply because it is the best implement yet devised to subdue rough, weedy land. On mellow soils indeed, it is of excellent service, since it cuts into the soil, pulverizes and intermingles it as no other harrow will do. As the angle of the axle with the pole is decreased, the draft is increased and the soil more thoroughly worked. This leaves the land in ovals the length of the axle, an objection to this and to all disk harrows that is partly overcome by half-lapping. We cannot speak of the durability of the Cutaway. It does hard effective work and the wear and tear upon the sharp blades and axle and joints must be proportionate .....

YOU can buy an ounce of asparagus seed for 10 cents. Prepare your bed (let us say 24 feet square) by spading it as deep as possible. Rake it level and sow the seed in drills four feet apart. It matters little how thickly it is sown. As soon as the plants reach a hight of three or four inches, cultivate the entire plot, cutting out the plants so that but one remains to every six inches. At the second cultivation, cut out every other plant, leaving them one foot by four apart. In the fall give this bed a covering of well-rotted horse manure two inches deep. This is to be left until spring, when it should be spaded under. The plot is now to receive cultivation as needed and the third spring, a liberal dressing of bone and ashes or bone and kainit will give asparagus as good as (better than, we believe) the one or two-year-old roots purchased of seedsmen will give the third year... .....

VICK'S Magazine praises the Diamond as bearing the most beautiful clusters without exception, of any of the white varieties of our native grapes, whether wholly natives or hybrids. This, as R. N.-Y. readers know, is a cross (Jacob Moore) between Concord and Iona, first fruited in 1880. The grapes are white, the vine vigorous and hardy. It ripens with the Delaware. Our specimen vine has not fruited yet.....

TRY some Savoy cabbages.....

TRY the Emerald Gem muskmelon for home use.....

WASH the trunks of fruit trees and such ornamental trees as are liable to be injured by borers—the Weeping Ash, linden etc. Color the wash, whatever it may be, so as to resemble the color of the bark. Use thin lime, adding soft-soap, carbolic acid, aloes, sulphur or something of the kind. Color with cheap mineral paint and lamp-black.....

PEOPLE who have fairly wintered, should not die in spring, except by accident, unless they over-do in some way, says that original thinker J.B. Olcott, in the Connecticut Courant. Doctors, undertakers, etc., ought to have a season of leisure now, and life insurance a spell of profit. But spring is too exciting, and people who try to whoop it up, unconstitutionally, are apt to come to grief. Before the leaves come to shade the earth, we are liable, quite suddenly, to have days, once in a while, as hot as the tropics. Then is the time for us to choose the lighter and cooler employments for ourselves and our animals. To kill people in trying to keep up with the spurt of a season that will presently be snowing, or raining like shot, is plaguy poor management. The way to behave, during one of the weather-breeding days in our spring-climate, is to look upon it as a show of some kind, as good as a horse-race or a circus. Let it heat itself, if it wants to, while we keep cool. That will be far more profitable than organizing funerals.....

THE Chilian and the Brazilian beets are remarkable for their large leaves and brilliant colors, remarks Peter B. Mead, in Orchard and Garden. Of the Chilian we have the Chilian Mammoth, the Scarlet Ribbed, and the Yellow Ribbed, and the ribs look like tinted

pearl, while the blade of the leaf is a carpet-work of brilliant color. Of the Brazilian we have the Scarlet Veined, the Crimson Veined, and the Golden Veined. Then there are Dell's Black, Ne Plus Ultra, and Victoria, all having ornamental foliage. These beets do not produce edible roots, but the leaves are used as a spinach, and the fleshy ribs, prepared like asparagus, make a very palatable dish; a happy combination of the useful and the beautiful. It is many years since the R. N.-Y. tried every kind of ornamental beet it could procure. The plants were used both as borders and in mass. They made a very interesting and pretty display.....

THE JERSEY BULLETIN says that the best butter, sold at the highest price, is made in private dairies. The great value of the "creamery" is that it is usually managed by a skillful man, who has all of the improved appliances, and makes a uniform article of much higher grade than much of the stuff made in private dairies .....

BUY 200 pounds of nitrate of soda; 600 pounds of bone flour; 200 pounds of muriate of potash. Divide each lot into three parts. Thus we have in each lot in round numbers 67 pounds of nitrate, 200 pounds of bone and 67 pounds of potash. On one plot of one-third of an acre sow 67 pounds of nitrate of soda, and 200 pounds of bone. On a second plot of one-third of an acre, sow 200 pounds of bone and 67 of potash. On the third, sow 67 pounds of nitrate, 67 of potash and 200 of bone—a complete fertilizer. We have now 67 pounds of nitrate and 67 of potash left. Apply this to the fourth plot of one-third of an acre. Should the season be favorable and these plots need a special or complete food, the above trials will be very likely to give you the information desired.....

THERE are many farmers who have the idea that when they buy high-priced fertilizers of old, well-known firms they pay a fancy price; that they pay for reputation, as when jewelry is bought of Tiffany or ladies' garments of Worth. The cases are quite different. All the materials of which fertilizers are made *can be* bought and mixed as well by one intelligent person or firm as by another. The firm that values its good name and reputation most, is the one that will strive to sell the article which will give the best satisfaction and thereby assist in maintaining that reputation.....

TOUCHING upon the above view of the case, the N. E. Homestead says that the average cost of 68 nitrogenous superphosphates as given by the Connecticut experiment station, Prof. S. W. Johnson, Director, is $34.55 per ton and the valuation $28.70, an advance of 20.30 per cent. on cost. In the same manner an advance of 16 10 per cent. over cost of materials is made by manufacturers on special crop manures. Compared with these figures the Mapes special crop manures, as reported by the experiment stations of Connecticut, Massachusetts, New York and Pennsylvania, net the manufacturers but 10.13 per cent. above cost. This profit has to pay all the costs in running the business.....

T. B. TERRY says, in the Ohio Farmer, that, almost without exception, the best corn-growers of Ohio say: "Work corn as deeply as possible at first; after that, not over two inches deep, ending up with even shallower cultivation, so as not to disturb the roots," numerous examples were given, at the institutes, where loss had come from deep tillage, particularly in a dry time, and where great success had come from shallow culture. This is in accordance with common sense, certainly, and if any reader has been in the habit of doing differently, he had better not be too sure he is right until he has experimented faithfully in the above way.....

THE NEW ENGLAND HOMESTEAD says good, vigorous, well-grown one-year-old asparagus plants are better for planting than older ones, just as a small tree is better than a large one for planting out. Capt. J. B Moore, one of the most successful asparagus growers, always preferred one-year-old plants for his own setting.....

LIME, says Mr. H. Stewart, in the Times, is one of the best preservatives for timber in existence. It neutralizes the acids in it and solidifies the albumen, thus preventing decay. It is the best material for preserving shingles and fence posts from decay, and also the sills of buildings and the walls and floors; it prevents wet rot and dry rot, and if painted over the iron work of plows it will keep them from rusting. It should be used as a bedding for the beams and floors of cellars when these are of wood, for it is destructive to all kinds of fungi, and even that pernicious fungus which causes the rot of potatoes, and many others are prevented by its use.....

FRESH lime will absorb one-third of its weight of water and will appear as a dry powder, commonly called air-slaked lime. This water it will absorb from the air as fast as it comes in contact with it, and hence a damp cellar may be dried very easily by putting a peck or more of lime in a box in it. In a few days the air will be dry and the lime will be damp and will have gained more than one-third in weight.....

WORD FOR WORD.

——BINGHAMTON REPUBLICAN "Queer about flowers, isn't it? They shoot before they have pistils."

——THE EPOCH: "Kentucky Constituent—How d'ye do, Senator? Can't you get me a clerkship under the new administration?

Senator—I'm afraid not, Major. The fact is, you look too seedy.

Kentucky Constituent—Then maybe I'd fit somewhere in the Agricultural Department."

——NEW YORK HERALD: "There is no profession which bears so great a responsibility or affords so many opportunities to serve the country as that of the really independent journalist."

——THE CENTURY: "Children are the coupons on the bonds of marriage"

——"White lies are the gentlemen ushers of the black ones."

——"Some people keep a friend as children have a toy bank into which they drop little coins now and again; and some day they draw out the whole of their savings at once"

——"It is only the unlucky who think fortune blind."

——ORANGE COUNTY FARMER: "Nothing daunted by its failure last year, the RURAL NEW-YORKER proposes to try again the task of raising potatoes at the rate of seven hundred bushels to the acre, by its trench system of culture. We hope success will crown its efforts. Even if failure again confront it, it will have the satisfaction of knowing it has done a good work and spread much valuable information among its readers. The Farmer has no petty jealousies in its make-up and can commend the good work of its contemporaries as heartily as its own."

THOMAS MEEHAN, in Garden and Forest: —"When in the boyhood of the writer, some fifty years ago, the pansy came to be some three-quarters of an inch in width, and the florists gave the varieties distinctive names, it was regarded as a wonderful achievement of modern skill. But an old work on horticulture in Britain, called '*Hortus Floridus*,' has recently been brought to light, issued two hundred years ago, in which are pictures of pansies just as large and fine The query is, had the florists of those early times agents in their employ with exaggerated picture-books, or were the pansies of those days as large and fine as those of our own time?"

——LIFE: "It is when the Young Idea first begins to shoot that a little learning is a dangerous thing"

Freight paid. *Guaranteed.* Hundreds in use. Circulars free. S. H. Garrett, Mansfield, O.

A QUERY.

WHAT "SUBSCRIBER" WOULD LIKE TO KNOW.

WE have recently received a letter from one of our well-known subscribers upon a subject which we prefer to publish for the perusal of our readers, anticipating that in so doing, some one will relieve us of the responsibility of answering "Subscriber's" questions. Here is the letter:

"*My Dear Editor*: For several years past I have been the recipient of several pamphlets issued from time to time by Messrs. H. H. Warner & Co., of Rochester, N. Y., which, in addition to containing an extensive treatise upon kidney disease, its origin, usual symptoms and growth, also includes numerous testimonials from parties whose fac-simile signatures are attached thereto, attesting the statement that they have been individually relieved by the use of Warner's Safe Cure, which is prepared by the above firm, for the use of persons so afflicted. Now, Mr. Editor, I would like to know if the statements made by those parties, who testify to the great good which Warner's Safe Cure has done them, can be relied upon? They seem honest enough from the way they read. "Warner's Safe Cure saved my life after the doctors had given me up," says John Doherty, 133 N. Main street, Concord, N. H. "I was given up to die with Bright's Disease of the kidneys. The doctors said they could do nothing for me. A friend advised me to take Warner's Safe Cure, and my family consider me as given back from the grave," says Mrs. Carrie A. Fry, of Wattena, Kan. Dr. L. B. Rice, of Hanover C. H., Va., says that Warner's Safe Cure cured him of Bright's Disease.

"Each pamphlet which I have received contains a hundred or more testimonials, and the same one does not appear in more than one pamphlet, so it seems that there are a good many who are being helped by that remedy.

It strikes me that there is a good deal of sense in the claim which those parties make that the doctors are treating too many persons for wrong causes, and that oftentimes, people are treated for consumption, brain, heart and nervous disorders, when they are suffering from kidney disease which should be treated, as they say, by the use of Warner's Safe Cure and as a result, when disease is first removed therefrom, that which is supposed to be disease in the lungs or other organs, will disappear. Many of my neighbors tell me that this remedy has done much good for them—more good than their doctors. If kidney disease is the real cause of so many other diseases why, Mr. Editor, don't the people who are afflicted with sickness, insist upon a more careful inquiry being made, in order that the true cause may be ascertained, and the proper treatment given?" "SUBSCRIBER."

"What! Corns and Bunions all gone?"
"Yes I am happy to say, through the merits of **Hanson's Magic Corn Salve,** I can now walk with ease."

HANSON'S MAGIC CORN SALVE.

If your druggist does not keep it, do not let him convince you that some imitation is just as good. Send by mail to **W. T. HANSON & CO., Schenectady, N. Y.** Every box is warranted to cure or money refunded.

PRICE 15 and 25 CENTS.

Farmers, CUT THIS OUT!
CHEAP PAINT FOR BARNS.

The secret of **Ready Mixed Paints.** Send me your address, enclose postage stamp and $2, and I will send you a printed formula (for your individual use only), for chemically preparing **Linseed Oil** and **Venetian Red Paint,** the *best wearing paint known* for Barns, out-buildings, shingle roofs, etc., mixed ready for use, at a cost of about 28 cents per gallon. With this formula you can mix paint any color you want. You save the manufacturer's and middle-men's profit on ready mixed paints. This formula will save you more than one half the expense every time you paint your buildings. A good investment. Warranted as represented. I have been in the paint business eight years—now retired. J. B. Barnard, Garrettsville, Portage Co., Ohio.

BEAUTIFUL WHITE PLYMOUTH ROCKS and WHITE WYANDOTTES. Eggs from choicest stock, $2 per 13; $5 per 40.
T. F. MILLER, Mattituck, N. Y.

THE late Dr. Austin Flint, professor in Bellevue Hospital Medical College, Fellow of the New York Academy of Medicine, member of the State medical societies of New York, Virginia, Rhode Island, Massachusetts, etc., says in speaking of advanced kidney disease (or Bright's): "Fatal termination is many times due to pericarditis (heart disease), apoplexy, difficult breathing, dropsy." The foregoing are but symptoms of diseases. That being the case there is nothing absurd in the claim made by the proprietors of Warner's Safe Cure that they prevent apoplexy and cure heart disease, etc., with Warner's Safe Cure. Why? Because it removes the cause of disease, and when the cause is removed the symptom called a disease is cured.

THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, MAY 4, 1889.

ARE there any special products that you would like noticed at greater length in our market reports? The R. N.-Y. wishes to prepare these reports so that they will be of the greatest value to its readers. We want to secure the latest and most helpful facts regarding the products in which our readers are deeply interested. Let us know what you want, and we will do our best to supply it.

They all seem to like our "Discussion" department. It is getting to be a genuine farmers' institute each week. The R. N.-Y. invites its readers to help out this department by sending short notes criticising or confirming anything that may appear in these columns.

THERE is no reason why newly introduced plants should be called somebody's "seedlings." There is a very good reason why they should not be called so, viz., they are not seedlings. If we plant a seed from the fruit (ball) of the potato, the plant *is* a seedling, simply because it comes from a seed. When we plant the tubers which grow from this seed, the plants are no longer seedlings, because they don't grow from seeds. The same is true of all other plants whatever.

"If our government cannot compel these corporations to serve the people economically, impartially and well, it will have to revoke their charters, refund their actual capital, and itself do the work they refuse to do economically and properly."—W. I. CHAMBERLAIN, page 300.

THE old, very old, question whether there are valid reasons why pale butter should not be colored so as to appear of a golden yellow is now being warmly discussed by many farm papers. The question is one that need not be discussed at all—every one can answer it for himself. Always assuming that the factitious appearance is given by harmless applications, we may ask, is it right to oil the hair, to shave, to color the beard or hair, to black one's boots, to paint one's house, except to preserve the wood? Is it condemnable that we should tidy-up when company comes and assume our prettiest ways? Ought we to clean up the grounds, rectify the margins, weed the flower beds and put on our best bib-and-tuckers on such occasions? Is all this the natural state or color of things? Oh! don't let's bother over splitting hairs. There is real reformatory work for farm papers to do. Let's do it.

"I can see no benefit, but injury instead, from the employment of tile to mark the position of the seed when planted. It will be better every way to use one or more short, light stakes for the purpose, since these will in no way interfere with the influences of light and moisture."—T. T. LYON, page 294.

Two years ago the Michigan Legislature passed a law taxing mortgages on property as well as the property they covered, thus imposing double taxation on mortgaged property. Just about that time there was a craze in several sections for legislation of this kind under the mistaken impression that it was a shrewd device for taxing capital. Experience, however, has shown that the holder of the mortgage merely raises the rate of interest enough to cover the tax, thus adding to the load of the already grievously burdened mortgagor; and the enforcement of the law has proved so costly and unsatisfactory that the House has just voted by a large majority to repeal it. Illinois has refused to pass several bills providing for the taxation of mortgages; Massachusetts declines to re-enact such laws, and wherever they are in force they should be promptly repealed in the interests of the poor mortgagors.

"As the mining interests are bringing millions into this State and Alabama for investment, so, 20 years hence, a large portion of seeds and plants will be grown in the South. But for excessive express charges we could even now grow and ship many plants at one-tenth of what Northern florists must charge to live."—A. Y. S., page 298.

MANY of our States are so large that no general description of climate, soil or other conditions will answer for the whole of them. Take Virginia, for example. People at the North and West speak of the climate and crops of Virginia as though these were similar all through the State. Here is what a subscriber in Virginia says about it:—

"In fact there is not a great deal of difference in point of climate between Southwest Virginia and Southern New York, except that the winters here are milder. Even the people of the extreme sections of the State may be as readily distinguished from one another in customs and dialect as the Yankee from the Westerner. They differ as much as the crops they grow upon their varying soils."

We do not realize what a great nation we have until we seriously think about it. We have every degree of climate and soil, we produce just about everything we need, and our people differ in size, appearance and speech about as much as can well be. Yet we are all alike at one point. We are all Americans, our labor all goes to build up and improve American homes and industries. Great thought, is it not?

"I suspect that the climatic changes in the heat and relative humidity of the air of our summers, wrought by the destruction of timber in the Eastern States, and the loss of our sea of prairie grass, and tens of thousands of swampy drainage centers at the West, have had more to do with our orchard troubles than the practice of root-grafting."—J. L. BUDD, page 294.

PHILIP D. ARMOUR is the most influential director of the Chicago, Milwaukee and St. Paul railroad, and the most important member of the Big Four dressed meat syndicate. It has just been discovered that the railroad, contrary to the Inter-State Commerce Law, has been making secret rebates on the transportation of dressed meat from Chicago. Very justly, there is a murmur of public indignation, which should become an outcry. It is evident that if Armour has not ordered this discrimination in favor of his own business, it has been made through his influence or with his approval. Directors of railroads are simply trustees of the property for the owners, and not for any one of them, and in this capacity each is under a moral obligation to manage the trust for the benefit of the stockholders at large, and not for his own advantage or that of his friends. How few however, put this principle into practice! How many of the great railroad fortunes have been made by wrecking the companies, the managers and directors robbing the stock-holders to add to their own unjustly acquired hoards! Isn't it time that the courts should punish such breaches of trust and of the law? And the more prominent the offender, the more impressive the lesson.

"It is to be hoped that each big boy and girl as well as each little one, will, on the coming Arbor Day, choose from the abundance of material, and lay a corner-stone on which will ultimately rise a living monument, more beautiful and graceful than the sculpture of ancient Greece, more wonderful than the pyramids of Egypt."—RUTH RAYMOND, page 307.

IT seems evident to the R. N.-Y. that there is to be, in the next five years, an immense development of the dairy business in this country. Many farmers have reached a point where "money" crops cost more than they bring in. In order to maintain the fertility of their fields, such farmers must either buy chemical fertilizers or keep more stock. The wonderful development of the dressed beef trade has practically driven the old business of steer feeding from average-sized farms. Farmers are beginning to believe firmly what scientific men have been preaching for years, that a pound of butter takes away from the farm less fertility than is taken in an equal weight of any other product. Creameries run on the cream-gathering system are coming into great favor. Make no mistake about it, the creamery system of butter making is destined to change the agriculture of a majority of the States—change it for the better, too. American dairymen must look up new markets. The most promising field lies to the South of us in Mexico, and the South American Republics. An association of business men has already been formed for the sole purpose of increasing American trade with these Southern countries. American dairymen must be represented in this association.

"Dealers know by experience that many farmers do not know plantain and other noxious seeds, or they would not continue to handle such seeds as one finds exposed for sale everywhere. I suggest that there should be an official inspection of all seeds put on the market, and that all foul or worthless seeds should be condemned."—A. J. A., page 298.

RURAL NEW-YORKER EXPERIMENTS FOR 1889.

AMONG the kinds of potatoes sent to the Rural Grounds for trial and already planted are the following: Seneca Beauty, Mrs. Foraker, Gov. Foraker, Hemstreet's No. 1, Starr's Beauty, Early Standard, Early Market, Badger State, Sunlit Star, Oneida Beauty, Lady of London, Boley's Northern Spy, Wide-Awake, Eyeless, Early Thoroughbred, Early White Ohio, Beauty of Hebron from Prince Edward's Island, Coy's No. 88 (third trial), Beauty of Beauties (second trial), Alaska, Jerrard's No. 2, and about 30 kinds not yet named. These all have been planted under the most favorable conditions; in fact, the conditions were, so far as can be judged, absolutely perfect. The only thing to be feared, the season being remarkably early, is frost in May. For the sixth or seventh year, trials with different quantities of fertilizers are being made from 440 pounds to 2,200 pounds to the acre. For the third year the endeavor to answer the question whether it is better to place the fertilizer under or over the seed is being made. For the third year, also, we have planted the seed-pieces all the way from two to 10 inches deep.

A little experiment that we shall watch with interest is this: Three barrels of the same size were first provided with ample drainage. They were then filled with sandy-loam enriched with potato fertilizer to within 14 inches of the top, and on this, in each barrel, a whole potato was placed, a different variety for each barrel. The potatoes were then covered two inches deep with the same kind of soil. As the sprouts appear above the soil, more will be added until the barrels are filled. After maturity the barrels will be carefully taken apart, and the soil washed away from the stems, roots and tubers, and photographs taken. The experiment may throw some light on the formation of tubers and the under ground development of the potato.

The usual number of new fruits, vegetables, etc., are being tried.

"It is not my experience that the application of manure or of fertilizers of any sort, will prevent the spotting, scabbing and cracking of apples subject to such defects; but without liberal manuring there is no solid success in orcharding; and a well-fed tree, even of a variety subject to the above diseases, will produce more merchantable fruit than a neglected one of the same variety."—T. H. HOSKINS, page 294.

GREAT PROJECTED EXPERIMENTS WITH DAIRY AND BEEF CATTLE.

THE New York State Agricultural Experiment Station, at Geneva, contemplates a series of valuable experiments with beef and dairy cattle, covering the entire range of milk, butter, cheese and beef production in the most efficient and economical way. It proposes to secure, free of all cost to the State for purchase, "the finest herd of blooded cattle in the world." The various associations representing the different breeds are expected to contribute gratuitously the choicest specimens of their favorites, and the desire of each association that its own breed should excel, is sure to make all eager to be very careful in their selections. Already a number of the best-blooded cattle in America have been presented to the State of New York by different breeders. The Holstein-Friesian Association has purchased and presented to the Station the finest heifer from each of the herds of Henry Stevens, D. B Whipple, Gerritt S. Miller and Smiths, Powell and Lamb, and a choice young steer from the herd of S. Burchard. Four fine Holderness calves from the Utica Holderness herd have reached the Station. Two Guernsey steers, two Guernsey heifers and one bull, selected from the finest herds of the breed, await orders from the Station for shipment. The Ayrshire Association has purchased four registered heifers and one bull calf from herds in four different States and will donate them to the Station. The Jersey and several other associations are now making selections with the same object in view, and when arrangements are completed there is no doubt that the finest herd of the best representatives of the various prominent breeds ever collected for experimental purposes, will be at the disposal of the Station. Will the results be proportionately valuable? It must be confessed that, with few if any exceptions, the results of such experiments on this side of the Atlantic have hitherto been of little practical value to the cattle owners of the country at large. With the ample means, improved appliances, lessons from other experiments of the same kind at home and abroad, together with no small amount of talent in the experimenters, it is to be hoped, nay, even expected, that the results of present experiments will prove more instructive and generally satisfactory than those of any of their predecessors.

"I measured my potato contest plot on April 13. The snow is not all gone yet so I could not measure very correctly. It is about 70 feet long and 30 feet wide. The bright new leaves of the pie plant were pricking up through the edge of a snow-bank to get a look at the sunlight. How would my Southern sisters like this prospect for raising a prize crop of potatoes?"—MRS. E. A. F., page 298.

BREVITIES.

How do you purpose to explain the growth of "a tree within a tree" as described on page 298?

How do our Southern readers agree with the remarks of J. P. A. on page 298 regarding seed corn from the North?

AN almond tree six years planted blooms this spring for the first at the R. G. It shows the mildness of the past winter.

READ the account of "An Original Potato Contest" on page 298. Such a thing would make things lively in your neighborhood.

WE are particularly desirous that those who have had any experience with onions as food for stock should tell us what they think of Mr. Whittemore's answer on page 296?

FOR salting cows the R. N.-Y. is using rock salt. The cattle lick the lump with evident satisfaction. This plan seems to us better than that of putting salt in the food. We have often noticed, at the South, the old-time "lick ball." This appeared to be a mixture of clay, salt and ashes, molded into a lump and placed on a convenient stump for cattle to lick.

THE California Experiment Station finds itself called upon with great frequency to make analyses of water. Many farmers want to know what the muddy water from the irrigating ditches contains. Owners of artesian and other wells want to know about the healthfulness of their water. Many owners of springs think they possess bonanzas in the shape of water for medicinal purposes.

THE R. N.-Y. has, ready for publication, one of the most thoughtful articles on agricultural colleges that it has ever read. This review, for it is a review of the work done by the colleges, and a general summing up of the returns they have made for the money expended on them, will be sure to create considerable discussion. The R. N.-Y. hopes that the friends of the colleges will read the article with great care.

AGRICULTURE develops. Here is an extract from a letter written by a farmer in a dairy district of N. Y. State where, five years ago, the silo was laughed at. "I hope by the use of the silo to be able to double our stock and increase the yield of our meadows. We will not have so much land seeded down, but will have more hay. We can afford to feed but little at the present prices, but trust to make the silage do the business, sending the hay baled to the metropolis"

EARLY planting is good. There is nothing that makes one feel better than to work ahead of one's work, so to speak. But when seeds are planted during a warm spell long before the natural season arrives, we must take the risk. Several market-gardeners near the R. G. planted Limas two weeks ago. Last Monday night, a sharp frost killed them and the work must be repeated The same frost injured the earliest-planted peas and potatoes; blighted the early magnolias and caused the hyacinths (in full bloom) to hang their lovely heads.

CLOSELY related to the sassafras, we have now the Spice-wood or Benjamin-bush in bloom, variously called by different botanists benzoin odoriferum, Laurus benzoin, Lindera benzoin, etc. It grows in low, wet places and one might readily mistake its yellow flowers for those of the dogwood—Cornus mass., the Cornelian cherry or several other kinds native of this country. The stems when bruised give out a powerful spicy odor agreeable to most people. It is a very hardy shrub and, where a varied collection is desired, should make one of the collection.

Miscellaneous.

NEW LEGISLATION NEEDED CONCERNING MONOPOLIES.

No. 5.

PRESIDENT W. I. CHAMBERLAIN.

In the last number we noticed that the only just ground on which our great carrying, lighting and communicating companies can justly hold their rights of way, public franchises and virtual monopolies, is that they may, and provided that they do, serve the public impartially, reasonably and well. But the public has been so lax in maintaining its own rights that the corporations have naturally grown arrogant, and restive under legal restraint. The Interstate Commerce Law was fiercely opposed and is still sullenly and only partially obeyed. There has been a fierce fight in Iowa over the legislation of last winter, which, to say the least, was not intended to be unjust to the railways,and which seemed needed to relieve our agriculture and manufacturers, almost impoverished, as the vast majority of the people believe, by freight rates that favor Eastern centers of commerce and manufacture, the mills of Minneapolis, the grain fields of Dakota and the ranches of the great West beyond us, to our own impoverishment in Iowa.

One principle seems to have escaped the notice of the people and to have been kept very quiet by the corporations, viz, that traffic increases directly with the increase of population and wealth along any given line and at its termini. But the cost of carrying, above "fixed charges" of road equipment and operating, varies inversely, or nearly so with the numbers or quantities carried; that is, the greater the population, the industries, the wealth along a line, the less the actual cost for carrying per ton or person. A street car line may lose money in a small city at a five-cent fare, but fairly "coin" money in a large one at the same fare. The money thus "coined," that is, all above a fair compensation for capital, skill, labor and enterprise, belongs not to the corporation but to the people, for they have created the cities, laid out the streets and increased the population and wealth; and the streets and highways used for intercommunication by these companies, belong to the people. The highways of commerce are one of the few classes of property held in common by the people, one of the few instances of communism that has survived under civilization and apparently must survive. The surplus money, therefore, which is "coined" by the use of these thoroughfares, above fair dividends on investment, should be left in the hands of the people by a gradual lowering of fares and rates and a gradual improvement in the quality of the service. Our street car and other public carrying and serving companies, as things are now, often serve the public wretchedly, at high rates, and at rich profit to themselves. All future charters at least should either be for much shorter time, or else should fix a sliding scale of rates and service graduated for and with increase in population. That this can be done is shown by our Post-Office system. Through this system our National Government has, for at least fifty years, served the public efficiently and well, at just about actual cost year by year, working constantly and steadily with increase of population and wealth towards *a maximum of efficiency and a minimum of cost*. Not fifty years ago it took two weeks and cost two shillings to get a letter from Boston or New York to Ohio or Indiana. Now it takes one day and costs two cents. It soon will cost us but one cent, and yet our Postal System will be self-sustaining as it has long been in most of the Northern States. Lightning trains exclusively of postal distributing cars, and steel arms reaching forth to catch mail sacks suspended in mid air, have almost reached the maximum of efficiency and speed; while the control of this vast postal monopoly "by the people and for the people" has also, all the time, in spite of changing administrations and political corruption, worked steadily towards a minimum of cost. Does any one believe that under our past laws any private corporation would have served the public in this matter so cheaply and so well? Compare the high prices charged by telephone companies, and the wretched service coupled with high rates charged by our telegraph companies. For three years our college in Iowa, with five telephone instruments in as many departments, all connecting directly with the telegraph office, has found the telegraph almost worthless, important messages often arriving or going so tardily as to lose their value and even cause much damage and inconvenience. But all public carriers of freight, passengers or communications, and all corporations given by law or charter a right of way with monopoly, or virtual monopoly, should be compelled by law or charter to do the same thing the government does, improve their service and reduce their rates with the growth of population and wealth, instead of rendering, as now sometimes, a minimum of service at a maximum of cost to a grumbling public. Let the public grumble to some purpose or else stop grumbling. Let the watchword be,

"A maximum of efficiency,
A minimum of cost!"

and let it ring through the land till all these corporations that form a part of the great circulatory system of our commerce, have heard and heeded it. If our great corporations choke the breath, and stop or check the coursing life-blood of commerce, the instinct of self-preservation will make our government throw off that grip even if it has to destroy its foe, private monopoly, and manage its own circulatory and respiratory systems. To drop all metaphor: if our government cannot compel these corporations to serve the people economically, impartially and well, it will have to revoke their charters, refund their actual capital, and itself do the work they refuse to do economically and properly. In Indiana the legislature passed laws reducing telephone rates. The companies threatened to withdraw from the State, and the legislature lost back-bone and grew weak-kneed. In an eastern city the council fixed rates; the telephone company refused service; the council ordered the streets and air cleared of all poles and wires; and the telephone company saw that it was check-mated. These companies forget that their franchises from the State are most valuable. In the game between the State and the monopolies it has itself created, there can be no doubt which will be check-mated if the game is played to the end with clear head and steady hand. But the state must not give away all its "pawns" at the start.

State Agricultural College, Ames, Iowa.

Dairy Husbandry.

MORE ABOUT TESTING MILK FOR BUTTER-FAT.

NO. II.

The more light shed on the composition of milk, the more intelligent manipulators of it become convinced that the proportions of fat and caseine to each other are quite uniform in their relations in the milk of common cows that have fair treatment as to food, drink and care. The chief variation—when there is any—is in the percentage of fat, and in its varying proportion with caseine in the course of one, two or three days at a time, and it is a curious and notable fact that when, for sudden cause, these temporary variations come, the average per week is substantially uniform. That is to say, if a cow suddenly withholds butter-fat in her milk so that it falls below the normal yield, she is quite sure within two or three days to swing it above the normal yield for a day or so. It would seem from this that there is no really great loss from sudden and temporary causes, that is not paid up later on. It would seem as if somewhere in the economy of the cow she stored up, in some place of safety, the valuable fat while her fright or other temporary cause lasts, and disgorged it bountifully afterwards, to restore the equilibrium. We are not able to explain the reason of this, it being among the unsolved questions about that wonderful machine—the cow.

But the fact of general uniformity of the proportion of fat to caseine in milk is so well established that, in measuring the commercial value of it, we may well take the most valuable element in it, and the one subject to most variation in percentage in proportion to the other commercial element. That element is the fat. We may with the more propriety do this, because it makes generally about 12½ times as much of the value of 100 pounds of milk as the caseine does, and the further fact that the caseine, being more uniform, and not worth more than two cents per pound, in any event, does not, we might almost safely say cannot, vary the value of itself in each 100 pounds of milk more than two cents ere the cow giving it has so proved her worthlessness as a dairy animal that she should be started on her way to the butcher's block, at short notice. The fat, then, constituting fully 93 per cent. of every dollar of value in milk, may justly be taken as the measure of the value of it for butter-making without a question; and for cheese-making there is no other practical and rapid method of measuring its value for that purpose than ascertaining the fat in it. No matter what those who do not see the point may prattle about the utility of some umpire to measure the per cent. of caseine in milk, yet it has not come to light, or need it come. The more men and nations know about milk, the sooner do they come to the conclusion that the butter-fat is a near enough criterion for measuring its value for any commercial purpose whatever.

No one can rationally doubt that it is the correct way to measure its value for butter-making; for all the other solids go for nothing in making butter; but they do go into the by-product of skimmed-milk that finds its way into the pocket of the producer, either through skim cheese, or in feeding it to animals. For cheese-making the three to four pounds of caseine in 100 pounds of common milk are worth from six to eight cents, and vary but little from two cents' difference from year's end to year's end, not enough to justify the expense of finding out how much the caseine does vary from day to day in cheese-making.

We come to the conclusion, then, that to define what shall be the total amount of solids to constitute it standard milk, is not only a useless endeavor, but in practice a futile one. The sugar of milk and the caseine are both so nearly of uniform proportion to the fat, when cows are in health and in normal condition, or they are lost in manufacturing, or if not lost in the cheese, are of so little commercial value that the practical man can't afford to hunt for them, and they must therefore be inferred in milk for domestic use, and the caseine must be inferred in cheese.

The fat, then, being the chief element, and the practical and just criterion by which to measure value, milk-testers that determine the per cent. of fat, are the only ones we need to concern ourselves about. This is the conclusion of the practical men, the voice of the *savants*, the uncomprehended truth for the old fogies to stumble over, and for the prattlers to allege, who darken counsel with unmeaning words, and suggest that a substance should be measured when there is no way practically to measure it, and if there were, it would be of no more use than a method to measure the bark on cord wood. That the fat measures the essential value of the milk, is the meaning of most chemical determinations; the meaning of the lactocrite, on which tens of thousands have been spent; the meaning of the test churn for either weighing or oil measure; and to come plump to the point, is the meaning and the mission, of the simple and effective method of testing milk for butter-fat, known as Prof. F. G. Short's saponifying and oil test, that has been so broadly indorsed as truth telling, by both the Wisconsin and New York State Experiment Stations. Not to advertise this non-patented article, that anybody may make and use, but to broadly discuss its application to the great dairy industry, will be the leading thought of the next paper. "WISCONSIN."

Market Notes.

TROPICAL FRUITS.

Oranges and lemons are in great profusion everywhere. From the mammoth wholesale houses, down to the Italian nobleman's push-cart, they are piled high in golden mounds. The largest and finest are sold "10 for a quarter," and from this they range to "25 for 25 cents." Bananas, red and yellow, ripe and luscious, are in full supply, and at prices that place them within the reach of all. Pomelos and lemons are plentiful and cheap. The bananas with which the Gothamites tickle their palates, come chiefly from the West Indies and Central America.

The crop has been particularly prolific this spring. The feature of the supply has been the fruit turned out from the plantations at Baracoa, in Cuba. The Cuban planters have developed a regular boom in the cultivation of the fruit, and are now making an ambitious bid for the patronage of the American market.

A cargo was landed in New York from Baracoa on Tuesday last that consisted of between 6,000 and 8,000 bunches, shipped as a sample of what the plantations could turn out. It was a very exceptional shipment,and created a genuine stir in the market. The fruit was reported to be of fine flavor, and was noticeable for its large size. Several times before banana shipments have been received from Baracoa, but they were nothing to compare in quality or quantity with last week's importation.

The shipments from Florida and Havana have both fallen off in the past fortnight, but the trade in Florida oranges is occupying a mighty large share of the attention of capitalists interested in fruit importation all the same. The Sicilian growers are managing to make a pretty lively time.

Strawberries, although not a tropical fruit, are plenty from Florida and Charleston, and are of very fair size and quality.

Vegetables of all seasonable kinds are in full supply. Old potatoes are plenty and ordinary grades are selling for about one dollar per barrel. Bermudas are becoming more plentiful, at lower prices. Onions are in full supply, and are selling at merely nominal prices. Very good cabbage, tomatoes, string beans, asparagus, etc., are offered.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

System and order are the only things in the world to make house-keeping a success or the reverse. No woman who does al her own work can make it run like clock-work all the time, because there are so many unexpected things; but she can at least so arrange it that the occupations fit one into another, and she can save many steps by so doing. When the work is all higgledy-piggledy—first one job and then another, without any idea of labor-saving—it is not strange if the worker is always tired and always at work. Lay out some systematic order of work, and then keep to it as far as possible.

* * *

The Rural has already spoken of systematic sweeping instead of having one great sweeping day, to sweep one room each day, bed rooms and all. It is not so hard to sweep a single bed-room, when doing up the chamber work, but it is hard to sweep three or four, while dusting is such a long and tedious operation that one room at a time is certainly sufficient.

* * *

The same rules may be observed in cleaning silver or other bright things. It is a great deal of work, when one is blessed with much table gear, to polish every thing at the same time. Far easier it is to rub half a dozen spoons or so each day, when washing dishes; it takes but little longer at the time, and expedites the work. We can't afford to neglect such little aids when there is so much to do, and but one pair of hands to do it.

* * *

We think that one of the hardest things to keep neat about the kitchen is the dish-cloth. It will get to look black and dingy, no matter how thoroughly it is rinsed after each dish-washing. Of course, after using, it should always be thoroughly washed with plenty of soap and hot water, and then hung out to dry. Use one cloth for crockery, and another for pots and kettles: they blacken the cloth very much, no matter how well washed they may be. The careful drying of the dish-cloth after each using is very necessary, for damp cloths of any kind, lying about the kitchen, certainly encourage water-bugs and roaches, as well as black-beetles and other insect abominations Keep the kitchen sweet and clean, and you have the first requisite for a wholesome house.

* * *

Cleanliness certainly is next to Godliness, but some women have a way of making their cleanliness so very oppressive that one would almost find dirt preferable. Thus Mrs. Gargery, in "Great Expectations," always cleaned house when she felt especially vixenish, and cleaned her mild and gentle husband completely off the premises. We don't believe in a person who makes her cleanliness a pretext for all sorts of domestic unpleasantness. When exact housekeeping is made a means of destroying the harmony of the home it looks as if the housekeeper thought more of her own way than of others' comfort. It may be housekeeping, but it is not home-keeping.

* * *

Could such a thing as a real *home* exist without a woman at its head? We don't think so—men may build houses and furnish them, but no mere man could, unassisted by a woman, establish a home. Women are the home-making sex, and sad it is when they lose sight of this fact. We always feel suspicious and doubtful of a woman who does not care for home and home life; there is something lacking. And it is noticeable that love for, and pride in a home, will keep a woman to the right when other influences fail. Let us encourage this home feeling, by all means, for it is one of the safeguards of the nation.

A QUAINT ORNAMENT.

OLIVE E. DANA.

ONE of our household has lately completed an ornament of which some of the RURAL readers may like to hear. The foundation is an earthen jug of quart size. It was first painted over, and allowed to dry. It then received a layer of putty, and immediately were pressed firmly into the putty all sorts of trinkets—tiny souvenirs, relics, keepsakes which had been gathered from out-of-the-way places in our house and given by friends for the purpose. Playthings saved from childhood, too tiny for any other use and maybe broken; also odd coins, a wee horse-shoe, fantastic buttons gleaned from the family button-box, a bit of chain, a wampum bracelet, old stencil plates, unused keys, shells, wee bottles, a queer pencil, tiny cones and discarded jewelry—all these and many other similar trifles helped to cover this jug, which bears all its contents on the outside. The literary member of the household gave a handful of worn out pens. One or two long-used thimbles gave added significance to the memorial of old days. The old clock which had long since refused to tick, gave its key, and souvenirs from the West gave a flavor of travel to this Maine medley. When it was well covered (and grains of corn helped fill the interstices) it was given some days in which to dry, undisturbed, and then received a coat of gilding. Its satisfied owner has bestowed the decoration of a bow of peacock blue, and, on a tiny stand in a conspicuous corner of the parlor, it receives a goodly share of attention and admiration.

INDEPENDENCE VS. SELFISHNESS.

J. H. G.

IS a woman who earns her own living independent? In some way it has come to be accepted that all a woman needs to do to become independent, is to acquire the ability to earn her own living. This is a mistake. She is under obligations to her parents and society, which are not satisfied by simply earning enough money to keep body and soul together. Independence means freedom from obligation, a condition which is, in the present condition of society, unattainable. I think one of the most radical defects in our modern system of education, is this striving to make men and women "independent." The whole drift of modern education is toward selfish egoism. It would elevate the individual at some one's else expense, without inculcating any deep sense of personal obligation to parents or society. It is a fact that no one can acquire sufficient education to be of any great practical value to the world without incurring obligations to parents and society, which a lifetime of usefulness would scarcely cancel. What we need is a deeper sense of individual responsibility. We need more of the spirit of Christ, the desire to go about doing good, helping and saving others. There are no conditions in life which require so much of this spirit as that of wife and mother. Max O'Rell talks of the want of gratitude and sense of obligation on the part of American women, but let us hope that he did not see the best side of American life, the country home life, the kind of life which is familiar to most of the RURAL'S readers; the kind of life which is made up of sacrifices and labor on the part of mothers, sisters and daughters. He speaks of the condition of women as he saw them in our cities, when he says:

"If an outsider be competent to form an opinion, I venture to say that the American woman does not render to man a tithe of the devotion she receives from him. The French wife repays a husbands's devotion by protecting his interests; an American one too often repays it by breaking into his capital. But Jonathan complains not. To him it is only seemly that 'beauty should go beautifully.' If one fortune goes, he sets to work to make another, and the sweat of his brow is soon crystallizing once more upon the neck and arms of his beloved womankind in the form of diamonds."

Commenting upon this criticism of American women, the Christian Union says that this question has been discussed before, and it is time for American women to seriously consider it. It says that hardly a defalcation is discovered that is not traceable to social ambitions on the part of the women of the family. Almost every breach of trust is connected with family social ambitions. And the very ones who tempt, actively or passively, drift or sail on till destruction comes, without question.

A wise physician recently said: "I tell you I have to see it. There are men whose only relation to wife and children is that of banker. When they die they are mourned as the bankers, the ones who made the incomes secure; their death means a percentage of danger to income." Women shrink from such arraignment, resent it indignantly, and many justly resent it. Yet too many American women do deserve it. Life is organized on too complicated a plan for the average income. The display at home and abroad shows the margin between income and outgo is too narrow. This is so evident that the social economist finds the family life of America threatened, and gathers statistics to prove that the higher the social grade the more the number of marriages decrease, and attributes this to the fact that the cost of supporting a family grows greater every year, and this increase is in the form of luxuries chiefly for women. Surely it is a serious subject and one worth the thought of all. The woman of limited income has her share in this reform. Every effort to excel in display, whether at a cost of one dollar or one thousand, is one more burden for some one to carry, and usually that some one is the man, who makes a double effort to meet the new demand and leave a margin of capital. Nor does the burden rest there. New standards of luxury are created for the children, who in turn refuse to establish homes on narrow incomes, because display, not happiness of the highest order, has become the object in too many families."

ONE WOMAN'S MEMORY.

OLIVE E. DANA.

THEY have just celebrated the 70th birthday of James Russell Lowell. Good work he has done as author, reformer, critic, and statesman, and very many who care nothing for his essays or his diplomacy or his oratory, enshrine his verse. But noble as are both his prose and poetry it seems to me there is in it all no other passage quite so beautiful as the one which is his portrait of the wife of his youth—"My Love." Others—friends of the poet—have told of her nobility of character and the sweetness of her disposition. The memory still lingers like a perfume around the old college-town where some of her brief years were spent. But this is the fairest and clearest picture this lover-husband painted and it stands for all to see. Was ever true womanliness better delineated?

"She doeth little kindnesses,
Which most leave undone or despise;
For naught that sets one heart at ease,
And giveth happiness or peace
Is low esteemed in her eyes.

"She hath no scorn of common things
And though she seems of other birth,
Round us her heart entwines and clings,
And patiently she folds her wings
To tread the humble paths of earth.

"Blessing she is: God made her so
And deeds of week-day holiness
Fall from her noiseless as the snow
Nor hath she ever chanced to know
That aught were easier than to bless."

CONFESSIONS OF A COUNTRY GIRL.

NO. VIII.

PATTY GARTON.

LIKE all girls, I think sometimes of such things as sweet-hearts and lovers—we all do, don't we? Do you know, I think that we country girls would often be the better for a little of the city etiquette we are apt to sneer at, especially as regards our association with young men. I do believe in frank friendship with young men, but it often degenerates into a hoydenish freedom which certainly rubs off the first bloom. Oh yes!—I know what you are thinking—you don't want people to say you put on airs, and hold yourself above other people. And perhaps—this is *very* confidential—you may think that a girl who holds herself up, and permits no freedom, will not receive those many little attentions we all desire. But I hold a different view—a girl who respects herself will be respected by others, and honestly, a man who is good for anything may laugh and talk and joke with an undignified hoyden; but when he chooses a wife she is pretty sure to be the opposite.

Few men care to marry a woman who allows the same freedom to every man she meets. Now, one thing I don't believe in is very much the fashion in country districts—that is, for girls to receive masculine visitors alone in the evening, often young men completely unknown to their parents. In many cases the parents never think of going into the parlor at all—"Jennie has company," and she must not be disturbed. It is not right—the mother should know just who comes to the house and associates with her daughters, nor should she leave the young people entirely alone. Just the same, girls should not be allowed constantly to go to all sorts of amusements escorted by a young man, without proper guidance. Take care of your daughters, mothers—it is no light thing to lose their girlish freshness of mind, and their innocence in their mothers' charge.

GOLDEN GRAINS.

HOLMES says that he has often observed that vulgar persons, and public audiences of inferior collective intelligence, have this in common: the least thing draws off their minds, when you are speaking to them.....

SORROW is not an accident, occurring now and then, says Robertson. It is the woof which is woven into the warp of life, and he who has not discerned the divine sacredness of sorrow, and the profound meaning which is concealed in pain, has yet to learn what life is. The cross, manifested as the necessity of the highest life, alone interprets it.....

HAMERTON says that a life without suffering would be like a picture without shade. The pets of Nature, who do not know what suffering is, cannot realize it, have always a certain rawness, like foolish landsmen who laugh at the terrors of the ocean because they have neither experience enough to know what those terrors are, nor brain enough to imagine them.....

IT is true that at no time in the history of this country did true Christian manhood weigh more, and a merely nominal church membership less, than now in the estimate of the business world.....

DID you ever see a child who would not return a smile? There may be a few such children, but they are the exception not the rule. The child face is a mirror in which is reflected the face of him who looks into it, as its mind gives back the image of the one who is training it. Those in charge of children should not forget this.....

BEECHER had the happy faculty of saying much in a little, for example, he says in regard to work, that there is no calling that is not made better by brains. No matter what a man's work is, he is a better man for having a thorough mind-drilling.....

IT is not work that kills men, it is worry. Work is healthful, worry is rust upon the blade. Fear secretes acids, but love and trust are sweet juices.....

CHARACTER like porcelain-ware, must be painted before it is glazed. There can be no change of color after it is burned in.....

EMERSON reminds us how cunningly Nature hides every wrinkle of her inconceivable antiquity under roses and violets and morning dew!—.....

THE church is your house, as hosts in God's behalf: and you are glad to have visitors attend its services. Then show them the pleasure you really feel at their presence. As host, introduce yourself; and make the visitors acquainted with others, so that they may feel that they are welcome. Invite them to come again. Do not give them occasion, from your manner, to think that your congregation is made up of a cold or exclusive set. A church is not a club, where all but those who belong to certain circles must expect to be snubbed, if they presume to intrude.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

SOME HINTS ABOUT HOME DRESSMAKING.

GIRLS, I want to talk to you a little about home dressmaking. I mean country girls, but, of course, anybody else is at liberty to read it. Some of you live far away from the town, and perhaps the village where you go to meeting can boast of only one or two dressmakers. (And they may not be much to brag about.) These as a matter of course, are monopolized by the most wealthy families, so the farmers' girls are left to struggle with their own gowns.

Now, you may be first-class needle-women, may know how to do plain sewing beautifully yet be unable to make your dresses so that they will give you any satisfaction at all. (I have experienced this state of affairs myself, so I know.) With a little teaching you might be able to do a great deal better, so I shall try to give you a few points.

The most important thing of all is the waist. No matter how nicely the skirt may hang, your dress will not look nice if the basque does not fit. If this is the first one you are to make for yourself, *buy a pattern*. Where can you get it? Anywhere. All you have to do is to mail 25 cents and inclose a stamp for reply, to New York, Philadelphia, or any large city where the great pattern-makers have offices. They will reply if you live in Arizona just as promptly as if you live in a neighboring town. To be sure, it will take you longer to get the pattern, but it will be mailed to you promptly. In ordering, give *bust measure* and tell just what you want in as few words as possible. (You can address The Butterick Publishing Co., N. Y., or Madame Demorest, 17 East 14th St., N. Y. City. Butterick's patterns allow for seams. Demorest's do not.

The *half* of each pattern is given, so it is necessary to have your dress goods double. Be careful always to have the two *right sides* of the goods face each other; if you are not careful you may cut two pieces alike for one side of the basque, or make both sleeves for the same arm.

The first thing to be done is to lay the pattern on the *lining*, so that the grain runs lengthwise of the pattern. Never cut the pattern cross-wise, as the lining will then pull out of shape. Be careful to cut each notch *exactly* as you find it on the edges of the pattern. If you do this with care, you will know exactly how to join the seams together by fastening one notch to the one on the corresponding seam. After you have your lining cut out, baste it together carefully and fit it on, *seams out*. You will find that you may have to take it in a little at one place, or let it out a little at another; but if you have given the correct bust measure, you won't have very much trouble. Let some one help you by pinning the places where altering is necessary. Then take it off and put it on with *seams in*. If it fits, mark carefully with a colored pencil or chalk the places where you basted it when it fitted you correctly.

Next rip out the basting threads. Lay your dress material on a smooth table; lay the lining on it, seeing that you have the grain *lengthwise*. When you have laid the parts of the lining on so as to cut with as little waste as possible, baste or pin the pieces down, and cut carefully. Baste each piece of the dress material to the corresponding piece of the lining, then baste the basque all together. If care be taken, the result will be quite satisfactory. After you have stitched all the seams up neatly, open them out and press with a warm iron. Then overhand the raw edges. You can buy bones already covered. These are very easily sewed in. Put a bone on each dart, and on the seams under the arms—never put any on the curved back seams. If you like, you may put one down the middle of the back.

In making a skirt, cut your lining first. You can buy cambric for this purpose for five cents per yard. Measure off the desired length for the front. Make the sides the same, but the back must be somewhat longer. If reeds are to be worn, you must allow several inches in length behind; if simply a bustle, you may allow an inch-and-a half, or two inches. Double your front breadth and cut it bias, sloping very *gradually* from the bottom to the waist line. Next lay down the two pieces meant for the side gores. They should be cut bias on one side only, in the same manner as the front breadth. If the skirt is for a slight person, or if the lining material is wide, one breadth doubled over and torn down the center will do for both side gores. The back breadth is perfectly straight. Slope the top a little from the middle of the front breadth over the stomach to the back breadth. You may arrange your dress material over this foundation to suit the fancy. For an ordinary-sized person the bottom of the skirt should be two yards wide. If for a tall person, from 2¼ to 2½ yards wide is best. (I'm speaking of grown people's skirts—not girls'). Sew the *straight* side of the side breadths to the *bias* of the front breadth. (NEVER sew two bias seams together—if you do you will have a point on each side of the skirt.) Of course, the back breadth is straight, so fasten these straight seams to the bias of the side pieces.

Skirt braids now come in side or box plaits. They wear much longer than the plain, straight braid and look very much better.

While dressmaking, always have a hot iron convenient, for it is, you know, "the botch-

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria.

er's best friend." Press all seams, except on silk goods. Some people have gowns made of lovely materials, yet look absolutely dowdy, because they fail to do this very thing.

DORA HARVEY VROOMAN.

WHAT ROCKS STRAND BEGINNERS IN HOUSEKEEPING?

JUDGING from observation and confidential chats, I should say that the first is ignorance, which looms up in an unselfish mother's love for her dear children. It is only by persistent teasing that the little daughter is permitted to wash and wipe the dishes, even for amusement, and when she might do it well, Mamma picks up the scattered ones, together with the iron-ware, and cleans them herself, thereby teaching the child to be careless and unmindful of the lesser matters. Perhaps when she is a dozen years old she is allowed to make a cake; but is not taught to scrape all the dough into the baking tin, and enough is scraped into the pail to make one or two nice patty-pan cakes. But it is work the child likes in making the pastry, and she soon becomes an adept in that line though a very wasteful one. But how is it about the bread? Not one girl in a dozen can make a decent loaf when she is 16 years old, no matter what her circumstances may be, and at that age nearly every Miss considers herself fit to be a bride. In this locality nine out of a dozen are married very close to their 16th birthday. What wonder that the young housekeepers are soon discouraged and give up in despair! The mother has done all the work instead of putting the daughter into the harness by her side.

"Mamie goes to school, and has so many studies that I know she must be worn out when it comes night, so I do not ask her to help me," says a fond mother. And Mamie comes home, throws her books down, catches up a novel and flees to the hammock, or perchance strolls off down the street with her mates. And the already tired mother becomes more and more tired, as she goes on with her self-imposed duties, creating for Mamie the rock of inexperience that will grow to a mountain of sorrow and discord when she goes to housekeeping on her own account.

I often wonder how experienced mothers can be so thoughtlessly *unkind* to their daughters when they know that it is not an uncommon occurrence for very young girls to take the reins of government into their own hands, and not a few women encourage their little daughters into making early marriages, and yet never give them any real experience in the ways of domestic economy.

"Let the girls have a good time now while they are young and care-free; they'll have hard times enough at best," says the over-indulgent mother.

Most assuredly the hard times will come when such a girl marries, no matter whether the husband be rich or poor; for ignorance, carelessness and inexperience would strand a veritable angel if thrown upon the sea of domestic economy without an oar or rudder. All the cooking schools in the world will not save an amateur, from being "oft in sorrow and oft in woe;" for one cannot acquire that perfect judgment and self-reliance in a few weeks or months that years of constant practice will give.

And there are so many times when it becomes a necessity to have a mind of one's own; there are so many ways to make a little go so far that to make a happy and successful home, a young girl needs to be well-learned in kitchen lore, even though "she is goin' to teach school so soon as she can get a 'stificate'" A portion of every day from the age of 10 to 15 years should be spent about the home-work, till Mamie or Jennie can be left to keep the house and do it well, even to doing the marketing and making her own garments and keeping them in good repair. Then, if she elopes with a dude or a farmer's son, poor management, as far as the home-work is concerned, need not be laid to her charge. Instead of being stranded on the rocks, she could sail calmly over the deep waters of domestic bliss.

MAY MAPLE.

NOTES.

THE Empire dress is worn in all its classical simplicity by young ladies, married and unmarried, for afternoon and dinner toilets.

* * *

EMBROIDERY patterns in applique, wreaths and detached bouquets over cloth, cashmere and silk fabrics are the hight of fashion for dress trimmings.

* * *

FLOUNCES are coming in again. Many of the new designs for spring and summer show them in great abundance.

* * *

MANY of the new Spring wraps have wing sleeves as did the winter ones, extending from the shoulder to the bottom of the skirt. But there is nothing so durable and serviceable as the close-fitting walking jackets, some of which show embroidered vests in Persian patterns.

* * *

THE redingote is still in great vogue. One never wearies of black, while the eye becomes tired of so much green, purple and blue. A redingote of rich black material, showing here and there a bit of colored lining, is both pretty and stylish.

* * *

LACE is to be in great favor the coming spring. It is used for trimmings on dresses and wraps, while the lace hat is to be more fashionable than ever.

D. H. V.

A PLEA FOR CHARITY SWEETHEART.

FOR my part I do not like the criticisms and disparagements which are flung at Charity, and I am glad that they have not silenced her and that she is able to speak for herself. Ever since she has made herself known I have had a good deal of sympathy for the motherless girl, who, quite likely, is motherless because the precious wife and homekeeper starved to death for lack of the loving care, the thoughtful help and appreciation, the culture and refinement of surroundings that should have been hers. By culture I do not mean that which is pronounced "cultchah," or that which pertains to wealth, leisure, or high position, but to the cleanliness, care and neatness, the eternal fitness of things which belong to the surroundings of every being, however poor and humble and laborious his or her life may be; and there are more women and children who are hungry and thirsty from lack of love and appreciation and from lack of these simple surroundings than from lack of food and drink for their bodies; more wives, mothers and homekeepers that die of this starvation than of lack of bodily comforts, whose greatest burden is not the daily labor which they perform, the daily sacrifices which they suffer for the husband and children, but the indifference, ingratitude and selfishness of those for whom they toil and endure.

The trouble seems to be that Charity, standing, as she does, in the place of mother and home-keeper, has dared to speak out and tell the truth about things which wives have suffered in silence, and timid women and selfish men are frightened at the revelations which she has made: the women for fear her lot and theirs may be made the worse, and the men for fear other women may be emboldened to speak for themselves and their power as slave-holders and task-masters may be lessened. As to the former, I think every true husband, father and son will rejoice that she has spoken that the scales may fall from their eyes and that they may be prevented from repeating the past in the future; for men are very, very blind in regard to these things. And as to the latter, no reformation, not even the abolition of slavery, was brought about until some one had spoken and revealed the wrongs that were to be righted, the sufferings of those who were held in bondage and oppression.

So let her speak on, and if she does not reform "A Man" or G. H. S., she *may* reform some other man.

News of the Week.

HOME NEWS.

SATURDAY, April 27, 1889.

OKLAHOMA is a very irregular, somewhat triangular-shaped tract of country containing 1,887,800 acres, or 11,800 quarter-sections, in the heart of the Indian Territory. The apex of the angle is at the south near Purcell, and a little north of this, on the line of the Santa Fé railroad, is Guthrie, and still further north at intervals are Oklahoma, Edmonds and Alfred; while Kingfisher is off the road to the west on the Cimarron river. The base of the "triangle," to the north, double as broad as the main body of the the territory, stretches along the southern line of the Cherokee Strip or Outlet, which is about 70 miles wide, and separates Oklahoma from Kansas. According to the latest accounts, a large part of the land is excellent; some of it ordinary and about one-third unfit for arable purposes..... Just before noon on Monday vast masses of people, variously estimated at from 30,000 to 100,000, were impatiently waiting along the borders of the Territory until, at noon, the signal should be given by the military authorities permitting them to enter. The crowd was greatest at the north, coming from every State and Territory to the "promised land," though there were a great many at the south also, coming chiefly from Texas and the other Gulf States. Many had also found their way into the neighboring Indian Territory to the east and west, so as to be ready to rush in at once and stake out their claims. Hundreds were also in the Territory hiding for the same purpose, while over 500 United States deputy marshals, consisting chiefly of land-grabbers, speculators and agents of syndicates and capitalists, had obtained their positions merely to be at the town sites beforehand so as to grab the best lots before the general scramble began. A large number of railroad hands vied with them in greed..... ..On the arrival of noon where the restraining soldiers were present and doubtless much before where they were not, the inrush began. Fast horses had been got ready, draft horses and others unhitched from the "prairie schooners," and madly dashed riders on in all directions to pick out the best locations, the biggest rush being, of course, made for the town sites, the most eligible parts of which were found to be already gobbled up by the bogus United States officials and railroadmen. After the wild scramble of horsemen, venicles of all sorts drawn by oxen and all kinds of non-speedy horses swept or crept inward. Meanwhile the railroad, which runs north and south through the easterly part of the country, was running section trains 15 minutes apart, and if joined they would have made many miles of continous train crammed inside, crowded on the roofs, jammed on the steps, and packed from the cow-catcher to the end. Never was such a scene in this or any other country. The territory which was supposed to be uninhabited except by officials at noon, had in a few nours a population of tens of thousands. Guthrie, a stretch of uninviting prairie at 12 o'clock, was a town with a population of 15,000, streets, a newspaper office, a bank, lots of stores, etc., etc., at 4, when a meeting was called to elect town officers. Much the same at the other town sites. All over the country all sorts of people were madly at work staking out claims or marking them in other ways, or hunting for them, or preparing to defend them. Rifles and revolvers were as indispensable as shirts or boots. Night brought no rest to a vast number, and the turmoil has continued ever since. There have been a scere or more murders due to disputes about claims, within reach of the telegraph, and God only knows how many in remoter places. Several deaths have occurred from over-exertion, and half a dozen or so have been driven crazy. Thousands couldn't get a chance, and others are bitterly disappointed with the character of their sections. While steady streams are still meandering in, other streams of larger volume are flowing out..... Much of the overflow is settling in the neighboring parts of the Indian Territory, especially in the Cherokee Strip and the other parts of what would have been Oklahoma Territory hadn't Congress killed the Springer bill creating it. It would have included the present Oklahoma, 1,887,800 acres; the Strip or Outlet, 6,022,244 acres and No Man's Land. 3,672,640 acres—a total of 11,582,674 acres. Reports say it would take nearly the whole of the United States Army to drive the desperate squatters out of their new quarters. Much of this land is finer than any in the territory just thrown open, and it is thought the Government must soon throw most, if not all, of this open also. Terrible destitution is already reported among many of the newcomers. Hundreds just managed to get there, with nothing left for support or to make a crop, and water is scarce in wide sections and provisions are unattainable. Think of water at 10 cents a glass even in Guthrie, and 25 cents for two small loaves! Out in the country, away from the railroads, things must be much worse in a region that has never known the plow, and from which all the cattle kings and syndicates have cleared out every head of stock..... Detroit is bound to have a grand International Fair and Exposition costing half a million dollars, $148,000 of which have already been invested in a splendid site near the city. The buildings will be the "largest in the world," costing $250,000 and covering 12 to 14 acres.... A mine of rock salt, pure and clear, has been discovered, 675 feet down, at Kingman, Kansas .. .. Negotiations for the establishment of that gigantic Anglo-American Salt Trust still continue and are likely to be successful very soon. A capital of $10,000,000 is reported to be already secured and much more is said to be within reach, if it is ever needed.....Postmaster Pearson of this City, who held the place under Arthur and Cleveland, has just died at the age of 45, from overwork—highly esteemed by all as the best officer who ever held the position..... .. The Minnesota State Legislature has passed a capital punishment law similar in some respects to the New York law. Under its provisions the prisoner is to be kept in solitary confinement and see no one but his family, his lawyers and his spiritual advisers. He is to be executed before sunrise, and may invite three persons to be present. The sheriff invites six persons besides the surgeon. It is made a misdemeanor for any newspaper to publish anything more about the execution than the mere fact..... Slaughter at grade crossings is just as frequent as ever. Wednesday last, John Wade, 62; his wife, 59, and J. M. Linderman, 14, were killed at Newport, Del., by an engine on the P. W. and B. R. R. No watchman or safety-gate, though hundreds cross the track each day, and 75 trains have chances to kill them.. ....One death from a virulent type of yellow fever at Tampa, Fla., last Tuesday—an unusually early case. Federal and State authorities are taking prompt precautions against any and all outbreaks. Camp Perry, near Jacksonville, can be made ready as an asylum once more for refugees in 24 hours. Danger greatest this year where fever was least prevalent last, as elsewhere most of the people have had it.....Just as the machinery constructors, in convention at Detroit, Mich., had nearly resolved to abandon the Knights of Labor, General Master Workman Powderly arrived there "opportunely" on a lecturing tour, Wednesday, and after some hard work got the convention to agree unanimously to remain in the Order..... ..President Harrison has issued a proclamation making April 30, a legal holiday in celebration of the Centennary of Washington's inauguration as first President of the Republic. As Congress was sitting in this city at the time, the ceremony took place here, and is to be commemorated by the grandest maritime, military and civic parades and festivities ever witnessed on this continent. Over 80,000 civilians will be in line on May 1, taking over 10 hours to pass a given point. On April 29 a grand maritime parade of men-of-war and merchant vessels will attract multitudes to the harbor. On April 30, about 50,000 troops will parade. Hundreds of thousands of of visitors are expected from all parts of the country, but, of course, especially from the adjacent States. All public and private accommodations will be taxed to the utmost to lodge and entertain them. Stands capable of seating a million are already erected along the line of march. The President and his Cabinet will take part in the celebration. There will be balls, banquets, fire-works any amount of bunting and buncombe, and for three or more days there will be the most hilarous, vociferous crowds and the most pompous pageantry and general uproar that ever startled this Western hemisphere. Even wealthy people living along the route of the parade, are letting the windows of their houses, many of which now command $500, and prices are rising..... A very pleasant event occurred recently at the hay-press works of Geo. Ertel & Co., Quincy, Ill., when Mr. Geo. Ertel was presented by his employees with a handsome gold-headed cane, suitably engraved..... Quebec is to have a $10,000,000 cantilever railroad and passenger bridge across the St. Lawrence.....All the Vanderbilt roads east of Chicago will abandon a large part of their Sunday freight trains beginning May 1..... ..The biggest fire in this city for years swept along the bank of the North River a week ago, destroying more than $3,000,000 worth of property, including two large grain elevators, together with vast stores of lard, flour and the like: 15,000 bags of Timothy seed were destroyed and 8,000 bags of clover seed. This was old, long-carried stock, and for some time it has had a depressing effect on the market, so seed merchants are not bemoaning the loss.. .....Both branches of the Minnesota Legislature have passed a bill making drunkenness a crime, and it now awaits the Governor's signature. The penalties are, for first offense, a fine of not less than $10 or more than $40, or imprisonment for not less than 10 or more than 40 days; second offense $40 to $50 fine, or 30 to 60 days' imprisonment; third offense 60 to 90 days' imprisonment..... .... New Mexico, nothern Texas and southern Kansas expect to gain considerable population by means of the Oklahoma boom. It's thought that many of the disappointed and disgruntled boomers will seek settlement in one of the neighboring States. A dozen agents of the Maxwell Land Grant syndicate are now busily canvassing the discontented people, expatiating on the advantages of their employers' place.....The Canadian Parliament has passed the Weedon bill enlarging the scope of the extradition treaty with this country, so as to render the Dominion an unsafe place for "American" boodlers and other rascals. Those north of the line now, however, are safe, as the retroactive provision of the bill has been cut out. .... The Pennsylvania Senate has defeated a bill against railroad grade crossings..... The Delaware House has defeated a bill providing for voting after the Australian fashion by a vote of 14 to 7—the Republicans all voting for it, and all the Democrats against it...An important railroad forfeiture bill has been stolen by Minnesota lobbyists just at the close of the legislative season, which, of course, acts the same as would a defeat of the measure. This is by no means an uncommon trick of such gentry... ..... The Illinois Senate has passed an Australian Election law, and the House put through a stringent Anti-Trust bill by an overwhelming majority..... Massachusetss has just defeated the prohibitory amendment to the constitution by about 50,000 majority. Including cider in its provisions gained the opposition of thousands of farmers the price of whose apple crops would be lowered by it, and farmers were expected to be its chief supporters. The same cause defeated a similar measure in New Hampshire a few weeks ago and is likely to do the same in Pennsylvania in a week or two.....

Valuable Testimony.

Those who are skilled in the nice adjustment of evidence will see why we value the following. They will also discover why we refrain from imposing further introduction or adding more than our usual suggestion as to brochure and address.

Hon. P. H. Jacobs, the well-known chemist, editor of the *Poultry Keeper*, *Farmers' Magazine*, and Agricultural Department of *The Philadelphia Record*, says.

"I have examined carefully the Compound Oxygen manufactured by Drs. Starkey & Palen; also their mode of *treatmeat* by *inhalation*, and have noted the great benefit to those who have used it among my personal friends. I cheerfully say that it offers better promises of curing such diseases as consumption, bronchitis, asthma, catarrh, dyspepsia, nervous prostration, rheumatism, neuralgia and all other complaints of a chronic nature, than any other treatment that has come to my notice. That it will give to the exhausted system renewed and permanent vitality is beyond a doubt."

The brochure to which we refer contains the history of Compound Oxygen and a record of cures in many interesting cases. This, with our quarterly review, *Health and Life*, will be forwarded free of charge to any one addressing Drs. Starkey & Palen, 1529 Arch street, Philadelphia, Pa; or 120 Sutter street, San Francisco, Cal.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, April 27, 1889.

ACCORDING to the latest reports from different points especially from the West, the crop conditions of the country are favorable. All the Northwest, West and Southwest are rejoicing at the good effects of the copious rains of last week. The cool weather has also given the grain a good chance to root, and the return of warm weather must cause a very rapid growth of spring-sown grain. The condition of winter wheat continues exceedingly good. During the last three weeks it has made very rapid growth, and harvest seems indicated at least 14 days earlier than last season. The amounts of wheat in farmers' hands are reduced to a very low per cent. The flour trade seems dull; stocks everywhere are very large, but no demand. The spring wheat seeding was completed last week. Oats have greatly improved during the last week. The rains came at the time when most needed. Grass has taken a wonderful start all over the West, and what promised to be a short crop 14 days ago gives evidence of being a good one. Pastures and meadows have sufficient feed for stock. Farmers have made good progress plowing for corn, and planting has commenced. The ground, however, is too cold for planting in the northern portions of the corn belt. Too much rain in Kansas and Missouri has delayed planting there, but should the remainder of April prove as favorable for farming operations as the spring has been thus far, we shall see early in May fully 50 per cent. of the corn in the ground..... The wheat deficit in the Australian colonies of New South Wales, Queensland and Tasmania is fully 8,750,000 bushels. Victoria, South Australia and New Zealand have an available surplus of 9,500,000 bushels. Shipments to Europe and the demands of South Africa and the South Sea Islands will, however, eat up this surplus, it is believed, and California, with her large wheat crop, expects to be called on to meet the requirements of the colonies..... ..... The official roster of the Patrons of Husbandry in Massachusetts shows that there are in that State 140 subordinate granges with a membership of 8,000—the highest the State has ever had..... The New York Assembly has passed Representative Erwin's bill establishing four dairy schools in this State, and appropriating $4,000 therefor..... ...The Secretary of the Home and Foreign Produce Exchange of London, England, has notified the Secretary of the Chicago Produce Exchange that American dairy products are in danger of being excluded from English markets under an act of Parliament on account of adulteration. He says that it is of the utmost importance to the future of the trade that American cheese and dairy products continue above suspicion and that the matter calls for prompt action. The Secretary of the Chicago Exchange has forwarded copies of this letter, together with other facts on the prevalence of dairy adulterations, to the legislatures of various States, and efforts will be made to secure the passage of bills in all Western and Northwestern States for the prevention of fraud in the manufacture and sale of adulterated dairy products..... Last Monday St. Louis dropped the antiquated and unfair method of selling poultry by count instead of by weight. Even the Mound City advances.....English hop-growers complain that California and Washington are flooding their home markets with a very inferior grade of hops which give them no profit while breaking down the English markets. ..... New potatoes have been selling at $10 per barrel in St. Louis and Chicago, and new tomatoes at $10 to $12 per bushel .. ..The Anti-Binder Twine Trust agitation is still flourishing at the West, and bids fair to amount to something..... An excellent selection—that of Prof. G. E Morrow, Champaign, Ill., to represent the Agricultural Department at the Jubilee Show of the Royal Agricultural Society of England to be held during the summer. He is also commissioned to visit other European countries and to study the live stock interests of the Old World for the benefit of the New..... .....The charter of the "Royal" was granted March 26, 1840. The Queen has accepted the Presidency of the Society this year. ..... Secretary Rusk has made the following New Jersey veterinary appointments to take effect on May 1. Dr. W. B. Miller, of Camden, and Dr. W. H. Cooper, of Salem to be inspectors of the Bureau of Animal Industry, the former at $1,600 a year, and the latter at $1,400, with traveling expenses, of course..... The New York State fair will henceforth be permanently located just outside Syracuse on commodious grounds, formerly a part of Smiths, Powell and Lamb's Lakeside stock farm, which have been donated by the city at a cost of $30,000..... English farmers and farm journals are justly berating the Privy Council for permitting the free landing of cattle from the Netherlands, which have for years been scourged with frequent and disastrous outbreaks of contagious pleuro-pneumonia. Isn't it time for Americans once more to raise their voices against the unfair embargo imposed on cattle from this country?..... The Illinois House has passed a bill making it a finable offense to sell adulterated or impure lard without a label stating specifically its character and quality.....The American Langshan Club will soon issue a new catalogue. A. A. Halladay, Secretary, Bellows Falls, Vermont.....At the Paris Exhibition Messrs. Vilmorin Andrieux & Co., the noted French seed house, will make a very extensive exhibit of seeds and agricultural products. They also wish to announce that they will be pleased to have such of their many American customers as visit the exhibition to inspect their large trial grounds and seed farms... ..... Florida orange growers complain bitterly of lack of proper transportation for their product, by which they have lost thousands owing to the rotting of the fruit before shipment or during culpably slow transportation. The fruit-growers cannot stand such treatment from the transportaton companies, and are trying to devise some better way of marketing their fruit. Associations are formed all over the orange-growing section, and a convention will be called before long to work out a plan for marketing the fruit different from the present .....James T. Riddle of the Western Reserve Stock Farm of Ravenna, Ohio, has just paid $2,500 to F. D. Stout of Dubuque, Iowa, for the eight-day-old bay colt Cortez, by Nutwood, dam Georgiana by George Wilkes, second and third dams by Mambrino Patchen, fourth dam by Mambrino Chief.....A bill is before the New York legislature providing that cheese made from milk from which any part of the cream has been taken, shall be branded "Skim Cheese."..... .....There's a good deal of talk about the establishment of a Plug Tobacco Trust; but one or two large firms aren't in it; and it can't do much harm without them.....

LIVE STOCK MARKETS.

NEW YORK, SATURDAY, April 27, 1889.

BEEVES.—Prices ranged from $3.50 to $4 70 for light common to choice heavy steers, but no extra cattle were shown. Fat oxen sold at $3 50@$4 20; bulls at $2 65@$3 40, and cows and heifers at $2 15@$3 25, with two or three head retailed at $3 50@$3 75.

MILCH COWS.—Receipts for the week thus far 136 head. A slow trade is reported at $25 to $45 per head.

CALVES.—Market depressed, and while strictly Prime and Choice heavy Veals sold up to about previous figures, all other grades of live Calves were ½c. to ½c. lower, and over 1,000 head were reported unsold.

Buttermilk Calves sold at 2½@3c. per lb; Mixed lots at 3½@3¾c; Veals at 4@5½c, and a few selected at 5¾@5¾c.

SHEEP AND LAMBS.—Demand fair, but at lower prices, both Sheep and Yearlings selling at a decline of 15c. to 25c. per 100 lb. The pens had not been cleared at a late hour. Some choice unshorn stock offered, but a good many rather thin clipped Sheep on sale. Spring Lambs were wanted at about previous quotations.

Sales—Clipped Ohio Sheep, 81 lb., at $4 50 per 100 lbs; State do, 91 lbs, at $4 62½; do do, 95 lbs. at $5 62½; Clipped Ohio Yearlings, 71¼ lbs, at $5 62½; Unshorn State do (Culls), 60 lbs, at $6; Clipped State Yearlings, 62 lb, at $5 50, do 56 lb, at $5 50; Unshorn do. 78 lb, at $6 75; Spring Lambs at $6 50 each.

HOGS.—Feeling a trifle easier, and Ordinary to Good Hogs may be quoted at $5@$5 30 per 100 lb. Sales—State Hogs, 212 lb, at $5 20 per 100 lb.

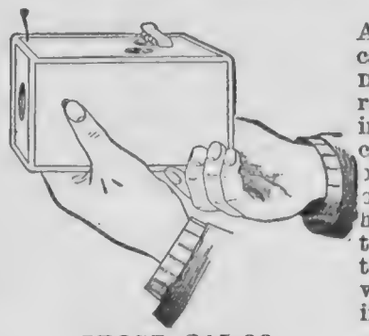
The Kodak.



PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be reloaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker

PROF. WM H. THOMPSON, M. D., University of New York, New York city, says: "More adults are carried off in this country by chronic kidney disease than by any other one malady except consumption." This shows that Dr. Thompson considers kidney disease a frightful malady. He also says: "Bright's disease has no symptoms of its own, but has the symptoms of every other disease." The reason why Warner's Safe Cure cures so many different diseases is that by curing symptoms, which are called diseases, it strikes at the roots of disease itself.

Newtown Double Geared, Level Tread Horse Powers.
AND THRESHERS AND CLEANERS ARE THE BEST.

We also manufacture Self-Dump Rakes, Corn Shellers, Farm Rollers, etc. Send for Circulars and Price Lists. A. BLAKER & CO., Newtown, Bucks Co., Pa

Literary.

OUR FIRST FARMERS' INSTITUTE.

BY WM. ROSS.

CHAPTER III.

SEVERAL days after the above colloquy took place, Bill walked into Judge Forester's office.

"Brother Bark," said the Judge, "suppose you write up to Columbus about that institute. I haven't time; I have the campaign to look after, and have to be away from home a good deal, and I can't attend to it very well."

"Oh, pshaw!" replied Bill; "they don't know anything about me up there. I have no influence, and Bonham would think I was some visionary crank, or something, and like as not pay no attention to it. You are in an influential position, politically and socially, and your name would carry influence, and you had better write. Besides, I don't want to get mixed up in this thing. It will take time and trouble, and I didn't begin it and somebody else may finish it."

"Oh, well, you just write, and sign my name to it," said the Judge. "Here is paper and envelop, and you do the writing and put my name to it and it will be all right."

"All right," said Bill, "I'll do that much, any time, to accommodate you, brother Forester."

Bill sat down and wrote:

"Woodside, Excellent County, 11, 1, '88.
MR. L. N. BONHAM,

Dear Sir: We have never had a farmers' institute in this county. Can you furnish speakers for one the coming winter?

G. FORESTER."

A few days later the Judge handed Bill a letter, saying; "I see it will require an answer, and you just answer and sign my name, and it will be all right."

Bill opened the letter and read; "We can furnish you one and possibly two speakers. At what point in the county do you wish to hold the institute? Are you sure you can get a good audience? Yours, etc.,

L. N. BONHAM."

Bill replied as follows:

"Mr. L. N. BONHAM,
Dear Sir:

We want to hold the institute at Woodside. It is our county-seat, has good railroad facilities, and I think there are *no doubts* about getting up a good audience.

Yours Truly
G. FORESTER."

When Bill came to the audience part, he stopped to think. He had talked institute to perhaps a half-dozen of his fellow farmers and they said they would come, he intended to be there himself, he was sure his friend Mr. Edwards, would be there, and as Mr. Edwards had been talking institute for six weeks, or more, he might succeed in getting a dozen or so more interested sufficiently to come, and they would all be good auditors, and inasmuch as Mr. Bonham had not introduced the numerical feature, Bill thought any number of good auditors would make a good audience. So he finished the letter and underscored the words *no doubts*.

In a day or two, Mr. Edwards and Mr. Bark met in town.

"I see we've got the promise of a lecturer for the institute," said Edwards.

"Yes," replied Bark, "and maybe two. They want a good audience and you want to be working it up pretty lively. They generally begin holding institutes, I think, in December, and if your institute happens to get on the list for an early date, it may come before you get ready."

"I have been a talking to a good many" said Edwards, "an' they nearly all say they 'll come if they can, and they think it's a good thing. J. B. P. agreed to open the fruit subject, C.D. 'll talk on Cereal Crops, but I hain't found a man that 'll take horses yet. There 'll have to be some money raised, there 'll be some expense, and I don't want to have to take up a collection at the institute. How do you think we 'd better do this now?"

"I think," said Bark "you had bettter call a meeting, and get an organization of some kind, so you will have a central working force. Then each one will know what to do, and know what his responsibilities are."

"How'll we get notice to the people?" asked Edwards. "We hain't got no money to pay for advertising, and the papers 'll want pay for it; won't they?"

"No, not if you don't put your name to it," replied Bark. "The papers will publish it as a local, and it will cost nothing."

"When had we better set to have the meetin'?" asked Jack.

"As soon as possible," Bill replied. "You can get it in the papers this week, and you can have the meeting next Saturday, at 10 o'clock, so the people coming from a distance can get here, and have time to get home again."

"That would be a good idee," said Jack. "But I don't know much about this. Can you write the notices and git them into the papers? You can do this better than I can."

Bill consented and wrote a local, notifying the farmers to meet at the Court House the next Saturday at 10 o'clock to make preliminary arrangements for holding a farmers' institute during the coming winter, and gave a copy to each of the four papers. Bill became somewhat interested, was "warmed up" as they express it at meeting sometimes, as he saw he had been helping to get his friends into the scrape, by what he had done, and he went to the meeting to help them out. The large Common Pleas Court Room, where the institute since met, was warmed, "swept and garnished" for the occasion. The aforesaid local notice had apparently increased the interest in the institute at least 50 per cent. There were Jack and Bill and a new man named Finley Quiets. They could see farmers on the streets, and they had solicited them to come to the meeting, "but they all with one accord began to make excuses." Mr. Quiets was a good acquisition. He was a considerably younger man than either of the others, and had a very happy faculty of accomplishing his work in a very quiet way. In his reputation he stood "A No. 1," and the confidence of the people in him was unbounded. The three warmed themselves with county coal till long after the hour of meeting had passed. They now realized that they had a terrible quandary to discuss. There were, probably, 3,000 farmers that ought to be as much concerned about institutes as they, but 2,997 of them were nonchalant. They discussed for two hours the dilemma in a desultory way.

"I don't believe it's any use," said Jack. "The farmers are not agoin' to take an interest in this matter, and I'm afeared it will be a failure. I b'lieve we'd better give it up."

"I don't know," replied Mr. Quiets, smiling; "it looks a good deal discouraging, that's a fact, but I don't see why we can't have an institute as well as other people."

Bill Bark thought of the power of printers' ink which he knew he could use, and his old-time determination revived in him, and his indifference all vanished.

He replied to Mr. Quiets: "The way to have an institute is to just have it. If we leave and do nothing to-day, we'll probably never have an institute. When will it be any better?"

"But how can we have it if the people won't take no interest?" said Jack. "We'll have some expenses to pay and I'm afeard it won't succeed."

"I have no fears about the people." said Bark. "We have a considerable time yet before the institute will meet, probably, and we can get enough interested to come and make a respectable audience."

"What is your plan, Mr. Bark, to get this thing started?" asked Mr. Quiets.

"Let us form ourselves into a temporary organization," replied Bark; "then appoint some committees and go to work. We'll not let on but we had a good meeting in here, and we'll call another meeting to make a permanent organization, and hear reports of committees, etc."

To this, all assented, and there was a very quiet election held; no boodle used, no wire pulling, no scratching tickets. The candidates all got office. Each one was a committee of one to tell the people the glorious news that Woodside was going to have an institute. Bill Bark was chairman of the Committee on Programme; Jack Edwards and Finley Quiets and three others were appointed a Committee of Arrangements. The meeting then adjourned to meet in one week. Bill wrote as big a local notice as he thought the editors would bear, in accordance with the edict of the convention, and gave a copy to each of the papers, and hoped there would be a good attendance. He also wrote an item stating that the Institute Committee had promised one or two speakers for an institute at Woodside the coming winter. These notices appeared in all the papers the next week as items of local news.

CATALOGUES, ETC., RECEIVED.

WHY NOT PLANT A GROVE?—This is the title of Bulletin No. 45 sent out from the Michigan Experiment Station, Agricultural College Post Office, Michigan. Dr. W. J. Beal states that he has prepared this little pamphlet with a view to awakening interest in forestry and also to give elementary hints on planting and managing young forest trees. Dr. Beal gives his essay in the form of a dialogue, putting himself in the character of a traveler who in passing a substantial farm house, in one of the older-settled counties of Michigan, pauses to converse with the house owner. A short conversation brings out the fact that the farmer has noticed that since the woods were cut down, the snow has drifted excessively, leaving the wheat fields with many bare spots and with some deep drifts. He has also noticed that since he cut down a grove that formerly stood between his house and the prevailing winds, the storms of winter have increased in volume, that his barns are colder and that the stock suffer more and eat more food. These points are just what the traveler wanted to bring out and he proceeds to show how the needed grove can be put back in its place. He urges the farmer to procure small trees, giving the names of two firms that will send such trees by mail. Then he gives some very useful hints about cultivating such trees. He says the roots of such little trees will live in the open sun and dry air just about as long as black bass would live out of water. They must be well planted at once and kept well cultivated. The little dialogue contains some excellent hints that many farmers need.

AYRSHIRE CATTLE BREEDERS.—The report of the 14th annual meeting of the Ayrshire Breeders' Association is sent by Secretary C. M. Winslow. The pamphlet contains the routine work of the meeting as well as the papers that were read. It is evident that the friends of Ayrshire cattle are enthusiastic and hopeful. They claim, as of old, that their cow is the best dairy animal in the world for "ordinary" care and conditions, while she will show the effects of good treatment quicker than any other breed.

FIELD EXPERIMENTS WITH CORN.—Bulletin No.4 from the Illinois Experiment Station, Champaign, Ill., is a somewhat voluminous report of 140 pages. The experiments were quite complete and the results are given at length. We shall refer to this publication again.

SUGAR CANE.—Bulletin No. 20 of the Sugar Experiment Station at Kenner, La., sent by Director Wm. C. Stubbs. This pamphlet is of value to the sugar grower directly, and indirectly to the general public who are all deeply interested in procuring cheaper sugar. The sugar bill of this country is as much a national disgrace as is the butter bill of England. We ought to make our sugar here.

ARBOR DAY PLANTING IN EASTERN STATES.—This is the title of a circular sent out by B. E. Fernow, Chief of the Forestry Division of the United States Department of Agriculture. It is designed to serve as a brief and simple list of instructions for school officials who desire to celebrate Arbor Day in a proper manner. Among the topics considered are the following: Time of planting, treatment before transplanting, method in planting a tree, watering, after care and choice of kinds. It seems to the R. N.-Y. that this is a very valuable little publication. A few carping critics try to make sport of this bulletin, because, they say, it gives only such information as every person able to plant a tree ought to know without being told. Well! well! ! What a world this would be if we all knew as much as some of these wise men! The R. N.-Y. approves of Arbor Day, not only because it believes the trees are needed, but because the beautiful ceremonies connected with the celebration are sure to bring to our boys and girls the best of thoughts and influences. And in connection with these remarks we want to publish the following thoughts which were prepared by one of our New York subscribers:

ARBOR DAY.

When our forefathers planted their homes in the primeval forest, the first work was to clear land on which to erect the rude cabin, and to raise grain and vegetables for sustenance. As there were no mills in the vicinity, or a market for timber, the most expedient way of disposing of the surplus, after logs for building and fuel had been reserved, was by fire. The ruthless destruction of a work which it took centuries to perfect has been inherited by their children, to whom it is not a necessity or an advantage, but a positive detriment. Granted that coal and gas are better fuel; that stone and brick are much more durable, while even paper now holds a place among building materials; yet the general effect that a total destruction of forests has upon the country has been for years considered a serious subject. And well may the Empire State be appalled at the devastation to which she is doomed should the Adirondack forests be razed. He who is surrounded by brick walls will tell you that could he only transport to his city home the magnificent grove of oaks, whose grateful shade he sought when a boy, it would give him more comfort and happiness than wealth can purchase.

Possibly Nebraska, that State of treeless plains, builded better than she knew when she established Arbor Day. Her notes of joy and enthusiasm were borne back to the Alleghenies, and the echoes reverberating aroused sister States to a similar observance: and now every year, thousands of animated children in the East and West, are each doing their little, which is, in the aggregate, a great deal, to redeem the errors of the past. There are so many beautiful native trees that great work can be done with little or no expense, save the trouble, (or pleasure) of transplanting.

Perhaps, all things considered, no tree is more desirable than the maple. It is of comparatively rapid growth, symmetrical, furnishes dense shade and is seldom molested by insects; while its beautiful tints in autumn more than compensate for the death of the flowers.

The Silver maple is easily grown, but is more objectionable on cultivated ground, as breaking the roots causes innumerable sprouts to spring up. Beech, dog-wood, sycamore, and tulip are easily procured in most localities. Some willows are graceful and well adapted to moist ground. The boy who has an eye for business may prefer one of the nut-bearing varieties, Even the little five-year old, "too little" to plant a tree, may drop a nut into the ground, and—what possibilities, from it! The chestnut is lovely when in bloom, its long catkins swaying in the breeze, while the prospect of an abundance of nuts in winter is no small incentive to a little labor. Then there are the evergreens, which, like true friends, remain always bright and pleasant, unchanged by storm and tempest. The American Arbor-vitæ is excellent for hedges, and the Hemlock Spruce is unsurpassed. The latter is also handsome when grown singly, its graceful drapery forming a pleasing contrast to the stiff, precise garb of its Norway cousin.

Equally desirable is the larch or tamarack, while the White pine and many more of our native trees are worthy of cultivation, and are sold by florists at a good, round price.

It is to be hoped that each *big* boy and girl as well as each little one, will, on the coming Arbor Day, choose from the abundance of material, and lay a corner-stone on which will ultimately rise a living monument, more beautiful and graceful than the sculpture of ancient Greece, more wonderful than the pyramids of Egypt.

RUTH RAYMOND.

FODDER CORN AND FODDER CANE.—This is the title of Bulletin No. 2, of the Maryland Experiment Station. Major Alvord, the Director of the Station, states in this bulletin:

"The condition of the worn lands of Maryland and adjacent States has led to a general recognition of the value of keeping more livestock on the farm, particularly to increase the supplies of home-made manures. If the animals can be so managed as to pay all costs and leave the manure they make as the profit, it may be considered good farming."

Then he goes on to say that one great problem before Maryland farmers is how to produce an abundant supply of forage on an economical basis. Assuming that Indian corn or sorghum will give a greater weight of fodder per acre than will any other plant, he gives the details of some experiments conducted with a view to determining the best methods of planting and cultivating these plants, with a view to making the best possible fodder from them. Those who are interested in the details of the experiments must send and get the bulletin. (It is mailed from Agricultural College Post Office, Maryland.) It is enough for us to record that Major Alvord concludes that corn or cane gives the greatest quantity of fodder, green or dry, when planted in drills far enough apart to permit easy and sufficient cultivation. Thick, broadcast seeding of corn gave a smaller yield of poorer quality, the product of an acre of sowed corn having a food value about one-half as great as that from the same acre in drills. To get the most food value on an acre of corn, it should not be cut until the plants begin to show signs of drying and the kernels begin to glaze. These are points that the R. N.-Y. has made clear a dozen times before, but as thousands of farmers do not seem to believe them, it is well to keep them before the public.

THE USES OF ASSOCIATION BY AND AMONG AGRICULTURISTS.—This is an address delivered by Mr. J. M. Hubbard of Middletown, Conn., before the Massachusetts Board of Agriculture. We regard this as an admirable essay. We wish it might be widely read and studied. Farmers need to be organized: without organization they lose power—social, business, intellectual, political power. It appears to be the object of this essay to point out this loss and to show how the loss might be changed to gain. The R. N.-Y. would like to have every one of its readers think over the ideas presented in this pamphlet. The following extracts are to be commended:

"My thought of the future of agriculture never makes the farmer's life one of ease and luxury. It never dispenses with the homely virtues of industry and economy. But it does bring to the farmer just recognition and compensation. I want the land upon which he works to recognize him as its master, and yield to him from its store-house ample returns for his toil. The land will recognize its master when he comes. When farmers fairly conquer the land they may rule it, but never until then. I want this compensation and recognition to come also from the community in which the farmer lives; and I believe this, too, will come when fairly conquered. When, therefore, I assume that the farmer of to-day is without the compensation and recognition he ought to receive, I do so for the purpose of stirring him to action, and not in the way of weak complaint against any other class. Agriculture must fight its own battles, and conquer and hold what is of right its own. And it must use in this strife the agencies which are calculated to win, It must use the power of association. It must not be deterred by the inevitable risk, or by the necessary cost, or by trivial criticism of details of organization. It must go forward, even at the cost of some mistakes, some losses, some defeats. It is a campaign, and perhaps a long one, for which the forces of agriculture have enlisted; but who doubts that it will issue in victory? Not he who is in his place and doing his work."

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

FISH IN A NON-NAVIGABLE STREAM.

J. B. McC., Greene County, Pa.—I live on a non-navigable creek. Parties on the creek own to the middle of it. Is there any law to prevent me from setting nets in the stream for the purpose of catching fish, if the party on the opposite side of it is willing that I should build a fish dam to prevent the fish from passing up the stream. The creek has never been stocked with fish. The fish are generally taken with nets. They come principally from the rivers to which they return in autumn.

ANS.—This statement of the case is not at all clear. With regard to streams not navigable, that run by the side of a man's farm, the owner has a title to the center of the stream, or rather of the current. If the same person be owner of the land on both sides, he owns the whole stream as far as his land extends on both sides of it; but no proprietor of land on a water-course, either above or below another, has a right unreasonably to divert it from flowing in its usual course into the latter's premises, or to obstruct it in passing from them, or to corrupt or destroy it, or to render it less valuable in any way. While therefore our inquirer has a right to set fish nets in his own half of the stream at any time, and in any part of it with the consent of the owner of the land on the opposite side of it, it is doubtful whether he has a right to build a dam or by any other artificial means absolutely to prevent fish from ascending the stream; for if it naturally affords good fishing higher up, by artificially preventing the fish from ascending it, it is obvious that it would be rendered less valuable to those owning land bordering on it higher up its course. It should be borne in mind that the game laws of Pennsylvania allow the killing of the following fish only within the given dates: Salmon and speckled trout from April 1, to August 1; lake trout, from January 1, to October 1; black, green, yellow, willow, rock, Lake Erie, and grass bass, pike, pickerel, and wall-eye pike or Susquehanna salmon, from June 1, to January 1.

PEERLESS DYES Are the BEST. SOLD BY DRUGGISTS.

BRUTE HUMANITY.

ONCE in the city of Vienna, there was a dread of hydrophobia, and orders were given to massacre all the dogs which were found unclaimed or uncollared in the city or suburbs. Men were employed for this purpose, and they generally carried a short stick, which they flung at the poor prescribed animal with such certain aim as either to kill, or maim it mortally, at one blow.

It happened one day that, close to the edge of the river, near the Ferdinand's-Brucke, one of these men flung his stick at a wretched dog, but with such bad aim that it fell into the river. The poor animal, following his instinct, or his teaching, immediately plunged in, redeemed the stick, and laid it at the feet of its owner, who, snatching it up, dashed out the creature's brains.

Which was the brute?

We may surmise what the Athenians would have done to such a man from the fact that they banished the Judge of the Areopagus, because he flung away the bird which sought shelter in his bosom.

There are men in whom is no spark of gratitude or generosity. There are others who appreciate benefits received and are happy in making grateful acknowledgement.

Rev. J. W. Asheman, one of the most eloquent divines of Detroit, Mich., writes March 3d, 1888: "In 1884 I visited Chatham, Ont., to lecture and preach. I was in agonizing pain (the result of kidney disorders), and unable to dine with my host. I explained to Judge Woods what was the matter. He asked me if I was too prejudiced by my medical education to try Warner's Safe Cure, adding: 'Although I have never tried it, I can take you to a gentleman whom it has helped wonderfully.'

"I used 25 bottles of Warner's Safe Cure and was in better health than for twenty-five years. I have everything to lose and nothing to gain by making this statement, save the approval of a good conscience."

There are tens of thousands of people in this country who have gained the approval of a good conscience in a like manner, and are not too bigoted to do good.

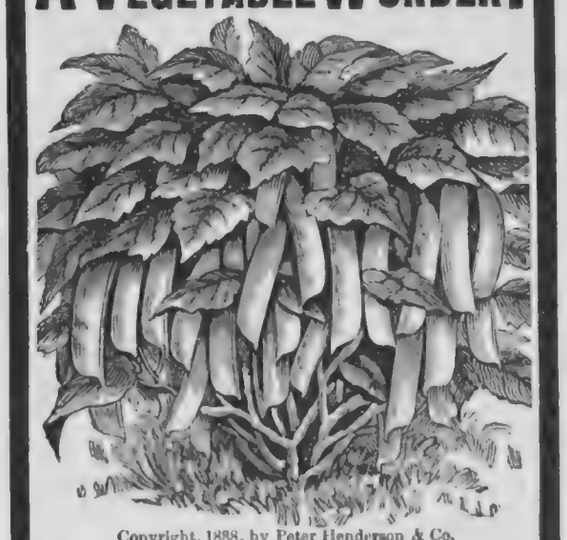
A VEGETABLE WONDER!



Copyright, 1888, by Peter Henderson & Co.

HENDERSON'S NEW BUSH LIMA BEAN.

Can and Should be Grown in every Garden on the Continent.

Of all the *Novelties* in *Garden Products* ever sent out, there is nothing so entirely distinct and valuable as this *New Vegetable.* The old Lima Bean can only be grown on poles, while the *NEW BUSH LIMA* grows and is cultivated exactly like the common bush or snap bean (growing only 18 inches high), and from the time of its bearing in July, produces in abundance delicious Lima Beans throughout the entire season until frost. It has, besides, an additional value, in that it is *two weeks earlier* than any other Lima Bean, being fit for the table in from forty to fifty days from time of planting.

Price (by mail) 25 cents per packet, 5 packets for $1.00, 12 packets for $2.00 (12 packets sufficient for an ordinary-sized family for the season). Directions for growing on each packet. Remittances can be sent either by Post Office Order, Postal Note or Stamps.

$100.00 in Cash Prizes for single plants bearing greatest number of pods. For conditions see Manual offered below.

Every purchaser of *Henderson's Bush Lima Bean* will be sent, *without charge,* our MANUAL OF EVERYTHING FOR THE GARDEN, a book of 140 pages, size, 9 x 11, containing 3 colored plates (the price of which is 25 cents), *on the distinct understanding,* however, that those ordering will say in what paper they saw this advertisement.

Horseman.

HEAD OF A WELL-BRED HORSE

SOME two years ago the R. N. Y. gave pictures of two widely different types of cattle. One picture represented a Short-horn heifer—probably one of the most beautiful animals in the country. This was designed to show what skill and care, coupled with scientific breeding, might accomplish. The other picture gave the head of a poor, old scrub cow, bruised, battered and neglected.

It was a very powerful object-lesson, showing that kindness and care in the handling of cattle pay, as the fact was never shown before. Now the R. N.-Y. repeats its former lesson, only taking two types of horses this time. The picture shown at Fig. 111 is drawn from life. Our artist tried to find the most intelligent-looking animal possible. He has chosen a coach horse that does daily service on Fifth Avenue in this city. This horse is half Clydesdale and half French Coach and is magnificently formed in every respect. His face is almost human in its intelligence. He may well stand as the representative of intelligent breeding and faithful care. Next week we shall show another picture—that of a poor, broken-down wretch of a horse, driven by inhuman treatment and carelessness to a ghost of his former self. It will make a powerful contrast; it will teach a mighty lesson, and may be the means of ending some of the cruel neglect that shows itself far too frequently on our streets.

It is one of the keenest enjoyments of the appreciative man to own and care for an intelligent and sensitive horse. It is one of the most aggravating and discouraging phases of farm life to be obliged to work with a "lunk-head," a poor, dispirited, wretched beast that has been cowed and maltreated until he has lost all respect for himself. For horses can lose their relf-respect, though good usage and kindness will bring some of it back again. A good horse or a vicious horse will reflect, in its temper and behavior, many of the characteristics of its owner.

HEAD OF A WELL-BRED HORSE. Fig. 111

Rural Topics.

A FARMER'S FARM NOTES.

OLD-TIME VETERINARY DELUSIONS.—It is surprising that so many farmers who ought to know better, stick to the old notion that when the end of a cow's tail is soft it ought to be cut open. Some time ago a farmer came to see my stock, and on going behind the cows took hold of their tails, and said they were soft and ought to be slit open. I told him I guessed they would be all right when they were older. He came to a Guernsey bull which is called a fine animal, and taking hold of his tail, said: "That is a handsome bull; but if his tail had been slit open a year ago, he would have been twice as large." Said I: "How old do you think he is?" He said: "A year and a half." I could hardly keep from laughing, and said: "He is just nine months old." You never saw a cheaper-looking man than he was, and he had nothing more to say about soft tails. A few days after this, I was in a neighbor's barn. He and his son were there and I told them what this man had said. He said the man was right and that their tails ought to be cut, and the son went along to their cows, and taking up the tail of one of them found it soft. He said the blood ought to be let out, and took his knife and slit it open. Since then I was in the same barn and the man told me they had a cow that had garget, and was giving bloody milk. They had cut a hole in her breast and put a piece of garget root under the skin, and the cow's breast was badly swollen.

FASTENINGS FOR COWS IN THE STABLE.—A few years ago I gave up the pole and chain for tying cows, and put them in stanchions, and like them very much. I know the cows do not have a chance to move their heads very much, but if they are bedded and kept as clean as they should be, I think they are as comfortable as when tied by chain and not receiving any better care than most of the farmers give their cows. I have an old-style barn, but have fixed it up so that the manure never freezes, except perhaps when it is very windy and the mercury goes down to 15 or 20 degrees below zero. Then the manure which is hoed back from the cows about 8:30 in the evening will be slightly crusted when I look in to see that all is right in the morning. The cows and bull are carded every day, summer and winter, from head to heels, and kept dry and clean. They are fed three times, and watered twice a day, and on pleasant days they stay in the yard an hour or so.

CHURNING BUTTER.—I see by the RURAL that some persons have trouble in churning, and have hard work to get any butter. My cows are Guernsey and Jersey and are fed good hay and three quarts of meal and two quarts of bran daily, and have salt nearly very day. The milk is set in shallow pans where the temperature is from 55 to 65 degrees. I skim when the milk has turned sour. The cream is kept down cellar in a room made for that purpose until just before churning, and then warmed to 64 degrees. I do not churn longer than five to eight minutes. I use a Blanchard churn and Reid butter-worker. I never use any butter color, and the butter sells for a good price.

HEN MANURE AN OVERRATED FERTILIZER.—There seems to be a great difference in opinion in regard to the value of hen manure as a fertilizer. Some say that a barrel of it is as good as a barrel of any fertilizer, and others say a barrel is enough to top-dress an acre of grass land. I have tried it on different crops, and have received very little benefit from it. Last season I planted three rows of fodder corn, using hen manure mixed with its bulk of loam, and three rows with twice as much manure, and the hog manure gave a good deal better results than the hen manure.

R. N. H.

Horticultural.

Night-Soil for Vegetables

IS IT SAFE TO USE?

WHY SHOULD IT PRODUCE RANK, COARSE VEGETABLES?

AN INTERESTING TOPIC.

MANY market gardeners report that their customers object to fruits and vegetables raised from night-soil or other rank manures. Among the many curious questions sent to us are the following:

1. *Would a plant manured with night-soil show an analysis different from that of another manured with a cleaner manure like a chemical fertilizer?*

2. *Why should night-soil, urine, or similar manures produce a coarser, less palatable vegetable than the fertilizer?*

3. *Are fruits and vegetables produced from manures containing disease germs or disgusting substances as healthy or as fit for food as those raised from chemicals?*

The frequency with which these questions are asked, has lead the R. N.-Y. to investigate the matter. The questions were sent to the parties whose answers will follow.

FROM PROF. S. W. JOHNSON.

1. Other things being equal no!

2. Because they are injudiciously applied. If used in excessive quantity they produce rank, coarse growth. If applied as a top-dressing to spinach or lettuce, they make these nasty externally and perhaps internally until rain-water and time destroy their ill-flavor. The vilest manures have been constantly employed in all countries, time out of mind, to produce the sweetest and cleanest of vegetables; but after the manurings they must have time to grow and develop their own flavor. Even varnish doesn't improve furniture until it gets dry!

3. Disgusting flavors may perhaps enter plants and for a short time be perceptible in them; but they evidently cannot remain long without change and disappearance. Disease germs certainly enter plants; for example, those of the potato rot and onion and rye smut, and these render the plants unfit for food; but whether in any case the germs of animal diseases, some of which (cattle plague) persist for a long time in the soil, can enter plants and through them infect animals, is so far as I am aware, an unsettled question.

FROM PROF. F. H. STORER.

The notion that vegetables manured with night-soil may taste badly has often been debated in all the civilized lands. No doubt there is, on this account, a certain amount of risk in using night-soil, unless care and good judgment are exercised to prevent the mechanical contact of the manure with the vegetables at inappropriate periods of growth. But there is a vast fund of experience to prove that no unpleasantness need attach to plants which have been skillfully grown with the help of human excrements. In so far as mere unpleasant flavor is concerned, that can doubtless be avoided by using the night-soil in not too large a quantity, and at early periods of growth. If need were, the trouble could be obviated by working the manure into the soil pretty thoroughly. But as regards the germs of disease—which is a far more important question than the other—it must be said that the subject has not as yet been adequately studied. Nobody knows precisely how long the several kinds of disease germs might survive in moderately manured garden soils, though it is probable enough that most of them would soon perish there, either from lack of food, or want of comfort, or by being devoured by organisms natural to the soil. In any event, the risk to health from this source would probably be but small; for, even if it be admitted that some kinds of disease germs could continue to live for months in the garden soil, the chances of their becoming attached to the vegetables growing in this soil could hardly be very great, provided the night-soil were applied to the land properly; that is to say, if the times when it was applied were suitable and the methods of distributing it were good. It is to be remembered, withal, that most vegetables are cooked before they are eaten and that the process of cooking would destroy the "germs."

It is not at all probable that analysis could detect any difference between plants manured with night-soil and others manured (as heavily) with chemical fertilizers similar to those which night-soil contains; though, as a matter of course, any plant which has been "forced" by means of large supplies of rich manure will "show its feeding." It is notorious that night-soil and urine, when applied copiously, do cause plants to grow rank and coarse—like the smart-weed, at the edge of a barn yard pool—because they contain certain soluble nitrogenous substances which constitute a highly acceptable food for plants; and it is as true of plants as it is of animals that care must always be taken, in feeding them, not to allow free access to large stores of rich food. Too much of a good thing is an evil to be avoided. In early times, the rankness of fresh barn-yard manure greatly troubled the wheat growers of Europe, and it is one of the merits of the artificial fertilizers that by applying them in moderate doses to certain crops in a rotation the full benefit of farm-yard manure may be gained and the rank growth of grain be avoided. Hence, too, the frequent use of artificials in conjunction with not very heavy dressings of dung. Barring the question of disease germs, which appears to be a purely hypothetical one, experience and scientific observation alike teach that the supposed objections to night-soil may be wholly avoided by using this manure with circumspection and knowledge.

FROM DR. PETER COLLIER.

I am aware that objections are made to vegetables grown on soil which has been fertilized with night-soil and other rank manures, I believe that, so far as this arises from any thing but mere sentiment, it may be explained by the rank growth generally secured under such conditions with perhaps less firm texture and deficient flavor, so that it is due rather to the lack of desirable qualities than to the presence of those undesirable. But there is abundant evidence to prove that, when properly used, nothing is better as a fertilizer. I do not believe that chemical analysis would indicate any difference between vegetables grown by the use of night-soil and those grown by the use of other fertilizers; but there might be a difference which chemical analysis could not detect, although I have no idea that such a difference would be found

A "disease germ" is a very small thing, but so large, nevertheless, that a camel would as easily go through the eye of a needle as could a "disease germ" enter into the rootlets of a plant.

"Disgusting substances" could, I have little doubt, find their way into a plant by means of the roots, but if they should do so, I have still less doubt that they would be oxidized or otherwise destroyed within the plant, which, as we know, has the ability by some process concerning which little or nothing is known, to elaborate within itself in certain plants the most grateful odors, as the rose, and in others the most intolerable stenches, as the Stink-horn.

FROM HENRY STEWART.

No doubt the fertilizers used have a considerable effect upon the character of the plants grown. This effect is well known in the case of sugar beets, upon which potash has an injurious result, making the reduction of the sugar impossible from the so-called intractable potash salts contained in the juice. In the case of tobacco also, a bad flavor is produced by coarse stable manure, and a bad burning quality by the use of fertilizers containing lime, magnesia, or chlorine. Tobacco fertilized with chloride of potassium takes up from the soil 40 times as much chlorine as when sulphate of potassium is used, so that it is an established fact that various manures may have an effect upon the constitution of plants, that would be readily shown by chemical analysis.

Now as to night-soil: I don't know of any exact chemical investigations which have been made for the purpose of testing the results of this manure upon the composition of plants; but I do know something practically of the apparent results upon many crops grown by its use from experience dating back 40 years.

My first knowledge was in regard to the growth of onions in the large market gardens adjacent to London and Paris when I lived in these cities as a student two score years ago. The drainage of these cities was very imperfect at that time, and hundreds of loads of night-soil were removed by the vegetable farmers every night. This night removal gave to this waste product its common name of night-soil. It was a specific manure for the onion crop which was grown year after year upon the same land, and fields of 40 acres or more were common a few miles out of the cities. Certainly the onions were of the most excellent quality—mild, sweet and succulent. The famous Italian onions are mostly grown in the same way, but with irrigation on account of the drier climate. Since then I have had personal experience among the melon growers of New Jersey near to New York City, all of whom make an annual gathering of the night-soil from the usual cesspools as the basis for a compost for his special crop. Every melon grower now knows of the Hackensack musk-melon. And this melon deserves all the praise it has gained for its tenderness, sweetness, succulence and peculiar, delicate aroma. There is no doubt that this manure is the secret of its good quality. I have grown peas, cabbages, carrots, tomatoes and radishes with this manure for my own use and have long ago got over the sentimental repugnance to it as a fertilizer. This manure does not produce a coarse, rank, unpalatable vegetable. On the contrary, its product is tender, succulent and sweet, and radishes and lettuce grown with it are of the very best quality, as I have reason to know from last year's experience.

The last question opens up an interesting chemical consideration. What is meant by disgusting? Disgust is a matter of sentiment. A farmers's manure heap is disgusting to those persons who are not used to its odor. I have been more disgusted with the rank odor of patchouli, used to excess as a perfume by ladies in social gatherings, than I have ever been with the smell of a barn or barn-yard. A very popular perfume is made from cows' dung and the manure of a well fed healthy cow is by no means disgusting as to its odor, until it decomposes. A rotten egg will easily disgust a refined person who will very readily drink, without any objection, a mineral water which has the very same sulphuretted hydrogen gas escaping from it.

"Disease" germs need special conditions for their growth. The poison of a rattlesnake is injurious if taken into a person's stomach. "Gamy" venison, that is, the meat kept until decomposition has begun, which is disgusting to some and pleasing to others, is by no means unwholesome to the stomach; and if a person inserted some of the fluid of it into a wound it would almost certainly kill him. And so there is no danger at all from the use of putrescent manures to the healthfulness of plants used for food that may be grown from them. China, with its enormous population, subsists mostly upon vegetables grown with night-soil. The most thickly populated country in the world, Belgium, is mainly supported by the use of night-soil for the abundant crops grown there, and it is quite common to see the gardeners and farmers collecting from house to house the refuse of the families carefully saved for sale, in suitable vessels, just as in some American villages the housewives save the ashes and bones for sale, and after dusk or at day-break an odoriferous traffic is carried on in this way in most of the Belgian towns and villages. With all these facts, there should certainly be no valid objection to the disposal of human wastes where they will do the most good, just as we dispose of the wastes of other, and less well-fed animals.

SUNBEAM WALKING CULTIVATOR. See page 323. Fig. 112.

Miscellaneous.

NEW LEGISLATION NEEDED CONCERNING MONOPOLIES.

No. 6.

PRES. W. I. CHAMBERLAIN.

CONTRACT AND ASSOCIATION.—Out of the right of life by labor grow as corollaries the rights of contract and association, only however for proper and lawful ends. They give greatly increased power either for good or evil. When used for evil ends their right name is conspiracy. These rights need sharp limitation by law, since they lead quite naturally toward monopoly. Indeed out of each of them have already grown great abuses. For example, out of contracts for grain, provisions and stocks for actual delivery, have grown the frightful evils of stock and grain gambling on "futures," greatly increased in possible volume by the system of "margins," while the manipulating of "corners" is not only like using loaded dice or concealed cards against one's fellow gamblers, but works great damage to the public at large. That "Old Hutch" of Chicago should in a month take over a million dollars out of the pockets or deposits of his fellow-gamblers might not perhaps alarm us so much did not transactions like his great September wheat "corner" disturb commerce and injure the whole country. Similar doings in 1879 sent the price of wheat for months above the European export demand, made England seek and develop wheat elsewhere, and nearly ruined our export wheat demand for years.

Similar gambling in stocks has wrecked many a railway financially. Such transactions injure the many to the vast enrichment of the unscrupulous few.

POOLS AND TRUSTS.—Associations, too, called "pools" and "trusts" have in recent years and months been found to diminish the production and increase the price of all the main essentials of life; the manufactured products that give us food, clothing, homes, furniture, utensils, fuel and light. Their nature and methods are fairly well understood. They form a gigantic corporation "that gobbles up" existing companies, controls the world's supply or the country's supply of some product or of the necessary machinery for manufacture. Take a few illustrations. The Oatmeal Trust pays several mills in Iowa $20,000 each, I am informed, to stop their mills or sell none of their product inside the United States. Some of us—no, *all of us*—pay those sums and enrich the trust besides. How? Well, to-day the farmer gets from 16 to 18 cents per bushel here for oats, one-half to nine-sixteenths of a cent per pound for oats, and pays five *cents per pound* for "rolled oats" or "rolled avena" or "oat meal." By the old laws water-power mills could only take one-tenth of the grist in toll. In the case of oats, under the "trust," the mills *take nine-tenths* and the farmer gets back almost exactly *one-tenth* of his grist! Is not this a burning outrage on its face?

The Copper Trust in France put copper at $400 per ton instead of $150 to $200. The stock of the trust was lately worth 900 cents on the dollar. It now seems likely to collapse. It bled the dear public too savagely.

Take another case; a "trust" to control twine for binding is now (March 16) trying to raise the price of twine from 12 cents to about 18 cents. The farmers' organizations all over the West are agreeing not to buy the twine at an advance above last year's prices.

The recent investigation before the Senate committee gave alarming proof of the effects of "trusts" in stopping mines, mills and manufactories, throwing men out of employment, severely injuring localities and greatly advancing prices of commodities to the damage of society and the enrichment of the unscrupulous few. By this raising of prices above their normal level these "trusts" tax the public "without representation," destroy

fair competition, disturb the normal relation between demand and supply, and seem almost to overthrow the laws of political economy based on a careful study of the facts of the past. Clearly society and Government, its representative, have the highest of all rights, the very right of self-preservation to place sharp limitations on "trusts" and prevent their cornering and controlling the people's supply of food and other essentials, and prime conveniences of life. Nor ought Government to compel the people to resist "trusts" by boycotting; combination by counter-combination; plots by counter-plots. The Government should *itself* deal with these harmful trusts as *conspiracies*, unlawful combinations, seeking by secret means the damage of society. If the Government leaves such matters to private adjustment, it neglects its own proper function of protecting society, and inaugurates intestine war between opposing factions. If this comes "they that take the sword shall perish by the sword."

Discussion, light, and calm investigation should be encouraged. With it our legislation is likely to be just towards the people—producers and consumers—and not unjust towards lawful combinations. Without such discussion and such light, the danger is great and manifest, viz., that the people blindly and numbly feeling the real injustice inflicted on them by railways, combinations, pools and trusts, shall rise in the wrath of communism, grasp the pillars of society, bow themselves in their might like the Hebrew Sampson, and bring down the entire structure of society upon themselves and the Philistines in common ruin.

That heaven may save us from such dire calamity is the prayer of all true patriots. Heaven will save us, if at all, only by the free and calm discussion of the philosophic and ethical principles involved, a determination to know the right and do it. Unless we are thus saved our Republic will perish like the Republics of the past. For the dangers that beset us from combinations of unscrupulous wealth on the one side, and communism on the other are the greatest that now threaten us.

State Agricultural College, Ames, Ia.

Various.

SOME HITCHES.

THE Engineering and Building Record recently published the illustrations shown at Fig. 113. A good deal of time and a good deal of property may often be saved by the ability to fasten a rope quickly and securely. Believing that some of the hitches here described may be new to our readers, we have reproduced the cut. In all the figures, S represents the standing end of the rope and F the free end. Fig. 1 is a simple round turn where the rope encircles the object once. A half hitch Fig. 2, is made by taking a round turn about the standing part, and then passing the free end through the bight. Usually two or three half hitches are used together, as at Fig. 3, and form a very secure fastening. When the strain is intermittent, the free end should be stopped, so as not to slip out of place when not strained. The half-hitch is very easily made, can be fastened on a taut line, and will hold on small objects. A clove hitch Fig. 4, is made with a round turn, and one half-hitch backwards, and will roll if the object can turn. A becket hitch, Fig. 5, is two half hitches made backwards, and is much used for fastening the end of a fall line to the becket of a pulley block. It will not undo, and the free end does not require lashing. This hitch is apt to jam, so that the line must be cut to remove it from the block. A blackwall hitch, Fig. 6, is used for fastening a rope that is to be under strain, to a hook: the standing part jams the free end and holds it securely. A timber hitch, Fig. 7, is easily made, holds well and cannot jam. It is much used for handling timber, but is not safe when used alone unless thoroughly made. A timber hitch and a half hitch, Fig. 8, are used for hauling timber, etc., endways. A roller hitch, Fig. 9, permits the object hauled to roll along freely in the rope. Fig. 10 is a harness hitch. Fig. 11 is a marlin spike hitch. Fig. 12 is a fisherman's bend; it is easily made, and very secure. Fig. 13 is a convenient hitch to use for taking strain from one end of a rope; A A, for shifting luff tackles, etc.

Sheep Husbandry.

A SHEEP BARN.

FOR 50 sheep I built a barn like that shown at Fig. 114, 22x50 feet. The lower story is open to the south and east. The wall is four feet high on the north side, the lower story is 7½ feet high, the second story is high enough to hold all the hay wanted. Two tubes with ladder sides extend from the bottom of the feed troughs to the top of the hay mow, (three by four feet). There are oval holes for each sheep, about six inches wide and eight inches long. The bottom of each hole is four inches from the floor of the feed trough. The latter is from 12 to 16 inches above the floor of the building, according to the size of sheep or lambs. The holes through which the sheep are to feed are about 20 inches from center to center. The space between the two troughs should be about four feet, or enough to allow one to walk through comfortably and feed sheep from inside. The rack or boards are just high enough to keep sheep from jumping over. There is a good passage of five or six feet at each end of the building to allow the sheep to pass freely without jamming together. With this plan the flock can be readily divided by temporary cross wickets or the gates. Any one who has attempted to feed a flock of hungry sheep with grain, or has come in contact with a cross ram will appreciate this plan of feeding. Very little feed will be wasted and the sheep will not crowd each other. The building can be extended so as to make it large enough for any number of sheep. If the ground is not very dry, a floor should be laid.

Farm Topics.

SOME COGITATIONS.

FRED GRUNDY.

FORETELLING THE WEATHER.—"Is the Signal Service a signal failure?" is asked on page 55. I rather think it is—to the person who looks directly overhead for his weather. In this locality we receive the "indications" for the current 24 hours at 10 A. M. By that time we know what the weather is, and is likely to be until night. But we want to know what it will be to-morrow. If we know how to read the Signal Service "indications," and understand the visible indications, we can, by comparing the two, tell almost to a certainty what it will be. This is how it is done: Nine-tenths of our weather comes from some point between N. W. and S. W. We note from which of these directions the cirrus clouds are moving, and whether fast or slowly; then we know the drift of the upper current of air. If this is from the N. W., we know that to-day's weather in Iowa, Nebraska and Dakota will be ours to-morrow, with possibly some slight changes, and we read what that weather is in the "indications" for those States. If the cirrus clouds are moving from the S. W., we look for the "indications" in Missouri, Kansas and Arkansas. If there is a storm in progress in any of those States, we shall get it, or part of it, within 24 hours. If it is fair in those States with W. or N. W. winds, and there are no local showers in sight, we can safely slash away at the meadow until night. But if it should be rainy out there, or if there are "local rains" with S. or S. E. winds, we had better move cautiously and finish up as we go along. Our rainy weather in summer almost invariably comes from some point between W. and S. and those are the points to watch. Our cold weather in autumn, winter and spring comes from some point between W. and N. and we watch the "indications" for the States out that way. A very few rains come from the S.; none come from the E., except such local showers as are developed in sight. I think the weather is a very fascinating study, and with the aid of the Signal Service and a little practice, any keen-eyed person may become quite expert as a weather prophet.

PREPARING FOR THE CENSUS.—In a late number of the RURAL some one suggests that farmers should prepare for the census to be taken next year. The suggestion is a good one. I took the census of this township in 1880, and of the 158 farmers that I interviewed not more than 10 were prepared to give anything like correct answers to half the questions relating to their vocation. They "guessed" this, and "thought" that, and "supposed" the other. If I hadn't been perfectly familiar with farming operations, my report would have been of little value. By asking an infinite number of questions I could get very near the facts. In the village, business men were prepared to give all required facts and figures right from their books, and I experienced little difficulty in gathering all the information the schedules called for. It really is surprising how little some farmers know about their own business.

OH, FOR BETTER CHEESE!—Governor Hoard, as quoted on page 73, gives the cheesemen a well-deserved pop on their thick skulls. I like good cheese better than meat, but I want to know that it is good before paying three prices for it. When cheesemen learn to supply the home market with cheese that is cheese, and not putty or tallow, the demand will quadruple in a very short time. People buy meat because they know it is real meat. They don't buy cheese because they don't know what it is made of, and they don't care to turn their stomachs into analyzing machines. Let's have some real cheese for the sake of variety.

AWAY WITH THE PRIVY VAULT.—The RURAL has condemned the privy vault. It is wise. The vault is the meanest and most utterly execrable and pestiferous make-shift that was ever devised. It is an abomination that is found on nearly every farm and village lot in the country. Common sense, common decency and the least regard for health demand that it should be abolished. I use a tight drawer arranged to slide under the seat from the back of the building. A plentiful supply of road dust is gathered at the proper season and stored for use. When the drawer is to be emptied a stay chain is hooked into a strong staple projecting from the front, a horse is hitched on and it is drawn out to the field or manure heap. It can be emptied and returned to its place in five minutes, and the labor is nothing.

SALARIES IN THE TOWNS AND WAGES IN THE COUNTRY.—I see in a local paper that my young friend B has "accepted a position" with X Z & Co., a hardware firm doing business in a neighboring town. I also *hear* from a neighbor that D, another young friend, has "hired out" to a farmer in an adjoining township. I learn that B receives $22 per month and boards himself, and D receives $18 per month and board. B has "accepted a position," which fact is chronicled in the local paper, and commented upon by his friends who regard him as a lucky fellow, with a brilliant future open to him. D has merely "hired out," which fact is not chronicled anywhere, or commented upon by more than a dozen people, all told. No brilliant future is open to him; he is not a lucky fellow; he delves among the dirt! If he places $100 in the bank at the end of eight months, and his wages are raised to $20, nobody will make any fuss about it. If at the end of two years he has $300 to his credit, he will be looked upon as a sober, steady hand. If B's salary is raised to $30 at the end of eight months, congratulations will pour upon him. If at the end of two years he still retains his position, and is out of debt, he will be regarded as a very promising young business man and his salary may be increased to $50, out of which he can, if economical, save $10 per month.

Young man, if you want to be *somebody* go to town and "accept a position." If you want to lay up something substantial for the future, go to the country and "hire out."

Christian County, Illinois.

Field Crops.

MELON GROWING IN INDIANA.

J. A. FOOTE.

Melon growing in Indiana formerly and today; favorite varieties; cultivation; planting; Nutmeg melons; starting the seed and after culture; profits in melons.

IN a few sections of Indiana melon growing is a considerable industry. Across the southern part where the soil and shipping facilities are favorable, it is carried on, and particularly in the "pocket" which is the southwestern corner of the State, and from there up the Wabash to Terre Haute and somewhat beyond. The place named was my home for many years and I am conversant with the business there. For many years past several hundred car loads of water-melons and Nutmeg melons have been shipped from there each year. It was famous for water-melons over 30 years ago, for a strip of sandy land, one to three miles wide, runs along the river through the county. At that time the Yellow Mountain Sprout was the principal one grown. I grew them myself, but 20 years ago the red-fleshed sorts superseded them, and now none of them is to be found. It occurs to me

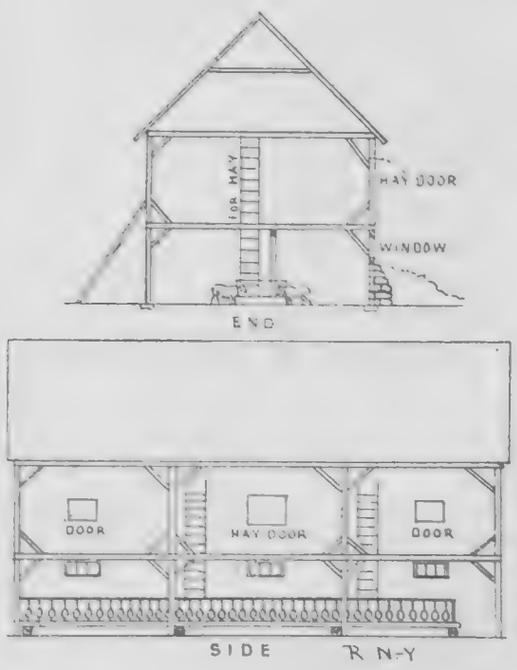

Fig. 114.

here to say that seedsmen do not control the varieties grown as much as they imagine—not as much as the market. For instance, many good varieties of water-melons have been introduced in the past 10 or 15 years; but Kolb's Gem was well in the market before the seed was offered, and has almost displaced everything else as a shipping melon, my impression being that nine-tenths of those grown in

the South and West are of that sort. At Terre Haute one other variety is considerably grown for the home market and shipping short distances, it being too tender to go far. It is the Dark-skin Icing, the best melon in quality grown, in my estimation. Its exceedingly crisp, tender flesh and sweet and delicate flavor make a delicious refreshment on a hot August day, one that seemingly could never be improved on.

Cultivation is done on a large scale, the patches being from five up to 40 acres, and the method involves no more labor than for a corn crop. Soil that will bring a fair crop of corn—say 50 bushels to the acre—will make a fair crop of melons. If this is not available, light manuring is resorted to, and about the first of May planting is begun in hills from eight to nine feet distant each way. Often full or partial replanting is required so that a start is not got until the last of the month. The hills are only slightly elevated on this sandy soil, and I have known some who planted in the furrow, counting that the crumbling of the soil fills up about the plant and aids materially in bothering the striped bug. Good seed frequently fails in cold, wet seasons, and with cut-worms and striped bugs it is no easy task to secure a stand. When this is secured the cultivation is as easy as that of corn—simply a constant stirring of the soil, which is left in a level condition, so that the cost, when the crop is ready for pulling, is only a trifle more than it would have been for the same area of corn.

It is only a few years since that the supply of Nutmeg melons was very limited. It grew with the demand, or perhaps an increasing supply created a demand, until now it is an extensive crop. They are grown also as field crops, and the cultivation differs from that of water-melons only in their being planted closer—say five to six feet apart. Of late, however, there is a difference in starting the plants. What was done on a small scale is now done on a large one—that is, the seed is started in hot-beds. In the first part of April seeds are planted in square quart fruit-boxes and placed in the hot-bed. Two of the most vigorous plants are allowed to grow, and about the time when seeds are usually planted in the open ground, these are transplanted to the field, the cut of a knife taking off the box and leaving the roots undisturbed. That this involves labor when done for the 10 or 20 acres is evident, but that it pays is proven, for the earliest returns are much the greatest.

As to varieties, the Hackensack has been most grown, including the Terre Haute Nutmeg, a sub-variety of that sort, much larger, sweeter and more productive, but not so regular in shape. The Extra Early Hackensack is now taking the place of the regular Hackensack. The past season that new melon, the Osage, has been also largely grown. This is a variety with a deep green skin, not lobed as the Nutmegs, and with an orange or salmon flesh, very thick meat of sweet and delicious flavor. Here is another instance of a melon taking the lead before the seed was offered by seedsmen. It was the leading melon in Chicago in 1887, as well as during last year, bringing 50 to 100 per cent. more than other melons.

Profits a few years ago were large, watermelons bringing from $50 to $100 per acre, and nutmegs up to $150; but these figures have dwindled owing to the over supply and especially to the shipments from the South. By the time the Indiana melons come in, the market has been full of Southern melons for a month, and no longer can fancy prices be got for the earliest ones. If we add to this, as was the case during last season, a cool summer, the price drops below a paying rate and melons are unprofitable. Probably, taking a series of years, this has been and will be as profitable as ordinary farm crops or more so.

Farm Economy.

COST OF ENSILAGE MACHINERY.

SUBSCRIBER, WESTFIELD, MASS.—What do the power and machinery needed to fill a silo cost?

ANS.—Here are estimates given us by some of the farmers who attended the recent Ensilage Congress, at Cleveland, Ohio.

FROM F. C. CURTIS.

I have used a 160-ton silo three seasons, and filled it the last two years with machinery the list prices of which are, for a four-horse power with all extras, $75; plain, $60; a Smalley No. 12 cutter with iron jack, $85; carrier 14 feet or under, $25 A good two-horse tread power—$120—would do the work about as well, costing a little more for belting, and as no jack would be required this rig would cost but little more than the four-horse down power. It will cut a ton of large Southern corn in about 20 minutes. I use two truck (low) wagons with 16 feet hay racks. One man cuts in the field; one man is with the team and one aids in loading. This one aids in cutting when not loading. The cutting machine is placed on a strong table about as high as the wagon rigging, alongside of which the load is drawn. The horses are taken off and attached to the other wagon for another load which is brought in, soon after the other load has been run through the cutter, by two men, who run the unloaded wagon out of the way, and oil up ready for the next load. We average two loads of about a ton each in one hour. The machinery named is from the Smalley Works, Manitowoc, Wisconsin.

FROM E. J. SMALLEY.

The cost will depend very much upon the size and hight of the silo. In a general way, the size of the machine is measured by the capacity of the silo. A man putting up from 50 to 100 tons would not require as large or expensive a machine as the man who puts in from 300 to 600 tons. Then again, the hight determines the length of the carrier so one can readily see that it is impossible to determine the cost till the manufacturer is posted on the hight and capacity of the silo to be built or that has already been built. For instance, I have just sent home orders for three No. 14 cutters for Genesee County, New York. J. C. Walker's carrier is 24 feet long; W. W. Britt's carrier is 16 feet long; N. H. Green's carrier is 46 feet long. Smith Sanburn of Orleans County has just sent in an order for a carrier 24 feet long, while Ora Lee of the same county has given an order for one 30 feet long.

Then again different parties have preferences for different powers. While some, especially the Germans, prefer a sweep or lever power, others will purchase only a tread power because in stormy weather they can cut their dry fodder in their barns. In Northern Wisconsin dry fodder cutting is looked upon as of as much importance as building silos and feeding from them, and in Manitowoc County every man having more than 20 acres of land has a power and cutter at his barn and cuts all his feed for horses and cattle, and all those having silos feed dry fodder once a day. Many who have silos mix one-fifth of dry cut fodder with the silage, claiming the cut dry fodder absorbs all the acidity in the silage.

Niagara County, N. Y.

FROM J. H. BRECK.

I use 18-horse steam power with a boiler of large capacity that was put in my barn when I used to steam feed. I have used several cutters but now I use the Silver & Deming Manufacturing Company's 24 inch cutter made at Salem, Ohio. It is a very strong, powerful machine with which I have cut two tons of fodder in 13 minutes with no extra hurry. One can use tread powers, sweep powers or steam. I cut one year with steamer for a thrashing machine, the owner furnishing a man to run it. A second-hand engine and boiler can be bought for from $150 to $500—say $250 to $300 for a good one. Buy a cutter with a large throat. Such a one is the cheapest in the long run, because when one starts to fill a silo or silos with the produce of 10 to 20 acres of corn that will average 20 tons per acre and more, he will find that a cutter that will cut a large amount in a short time is what he wants. My engine and boiler cost $400, cutter and carrier $160.

Cuyahoga County, Ohio.

FROM M. C. DANFORTH.

I use a No. 11 A Ross cutter made at Springfield, Ohio, and the power is a small grinding power and mill combined called the Victor made at Canton, Ohio. It is easily worked by two horses. I cut last season three large loads estimated at 3,000 to 3,500 pounds each in 40 minutes. I attempt to fill my silos with ordinary farm help. We go in the field and cut and haul three or four loads to the machine, then cut it into the silo. We cut from 10 to 15 loads per day. My cutter was listed at $45; the power at $60. They were bought several years ago. The same goods ought to cost less now.

Summit County, Ohio.

FROM L. R. FOSTER.

I use the Tornado cutter manufactured at Canton, Ohio. I think it is the best machine for cutting corn fodder, especially silage. The power I use for cutting dry fodder in winter is the Buckeye four-horse power, which costs $45. I hired a man and engine last year to fill our pits; for pits not more than 16 to 18 feet deep, the power is sufficient. My pits are 25 feet deep. My elevator is 30 by 25 feet. So I used more power. My machinery cost $160. The cost will be regulated by the amount of carriers used. I have 55 feet, the price is 50 cents per foot.

Summit County, Ohio.

FROM G. E. RICE.

I have a two horse tread power made at Albany, N. Y. which cost $180. I used a No. 14, A Ross cutter with a 20-foot carrier: cost $100 It costs about 50 to 75 cents per ton of 50 cubic feet to take the corn from the field and put it in the silo. One set of machinery will answer for four neighbors as well as for one. Before I bought my tread power I hired a portable engine and man at $3 per day. There are many good cutters in the market, the Ohio, made by Silver & Deming, Salem, Ohio, is first-class.

Trumbull County, Ohio.

FROM O. T. BANTES.

I have a No. 14 Ross cutter made at Springfield, Ohio. This and a 22-foot carrier cost $100 nearly two years ago. My silo is nearly 16 feet high. By placing the cutter on a platform about two feet high, it will deliver the feed into the door of the gable. For power I have a sweep made by the Forest City Machine Works, at a cost of $50. The power is not sufficient to run the cutter to its full capacity. We run through about 15 tons per day with two horses on the sweep. The cutter has a capacity of 25 or 30 tons per day. I would not advise any one to invest in sweep power. I think a two-horse tread would furnish nearly double the power, but it would cost more if purchased new.

Cuyahoga County, Ohio.

FROM HENRY TALCOTT.

I always hire a man with a traction engine used with a thrashing machine at $4.00 per day, and use a No. 12 Tornado feed cutter that cost $40; a 24-foot carrier that cost $32. The cutter cuts and splits the largest stalks into little fine shreds, and stock will eat every particle. I never saw such perfect work with any other machine, and it cuts different lengths. The same firm makes larger and smaller sizes—Nos. 8, 10, 12, 15, and 18. I can cut 40 tons per day.

Ashtabula County, Ohio.

FROM NEWTON RICE.

I have used an engine and horse power both sweep and tread; but I much prefer the two-horse tread power, made at Garrettsville, Ohio: cost about $100. A No. 14 Ross cutter made at Springfield, Ohio, can cut with this rig 30 to 40 tons per day one inch long. There is a considerable difference in different makes of tread powers as to the amount of power one can get from them. It is very important to have the pulleys on the power and cutter of the right size so as to get the most power from them. I cut silage for 12½ cents per ton for my neighbors, they putting the corn on the table. The cutter and belting cost me $65.

Portage County, Ohio.

FROM W. A. WHEELER.

I use the Smalley cutter No. 12, No. 14 would do better. For power I used an eight-horse engine: I paid $2 per day. It cost me 35 cents per ton to draw, cut, and fill the corn into the silo. The Ross cutter is a good machine; so is the Ohio, manufactured at Salem, Ohio. An eight-horse sweep power would do good work, but tread powers are too slow.

Lake County, Ohio.

FROM W. H. STRONG.

I use a three-horse power Shipman coal oil engine. I use crude oil, which has to be warmed to work well. The engine cost $300. It runs a No. 13 Ross cutter with a 20 foot elevator. This cutter cost $78. In filling my silo we averaged 18 tons per day. Cut one-half inch lengths.

Lucas County, Ohio.

FROM S. A. REED.

After using both steam and horse-power, I would not advise any one to use a horse-power if an engine can be hired for a reasonable rate, which is $3 to $4 per day, with one man. When buying a cutter, be sure to get one that is large enough, as the extra power required will not cost any more than if running a small cutter. I shall buy a Silver & Deming cutter of large size for my use.

Oberlin, Ohio.

FROM A. S. EMERY.

I have a 10-horse power engine that cost $150. My 17 A Ross cutter, with 16 feet carrier, cost $132 delivered at station here. I would not buy power again as I can hire power with man for $2.50 per day, when thrashing is over, thus saving care of engine, etc.

Cleveland, Ohio.

Market Notes.

IT would be a first-class object-lesson for any farmer who contemplates shipping his produce to visit the markets of New York, or of any other large city, and learn the requirements of the markets, best methods of packing, manner of selling produce, etc.

Many farmers seem to think that commission merchants are all swindlers. While there are undoubtedly some dishonest persons in this as well as in all other branches of trade, the writer is inclined to the belief, after careful inquiry and observation, that the majority are as honest as the rest of mankind. A few facts, gathered here and there, may serve to illustrate. There are usually two sides to every question; these facts are from the commission merchants' note-books:

Last fall, a farmer in Michigan shipped to a commission merchant here, a car-load of apples. They might have been sold for one dollar per barrel, but the shipper ordered them stored and held for higher prices. This was done, the merchant paying the freight and storage amounting to about $80. After holding the apples until spring, what were left brought just $40. The merchant is out about $40, besides his own labor. Another shipper sent a lot of dried apples which were of such poor quality that it was impossible to secure an offer for them. Another lot of apples were sent when the market was so glutted that the price secured for them was just enough to pay for the frieght, commission and barrels. Another shipper sent on a lot of bones, marked "chickens," which, as a matter of course, sold at very unsatisfactory prices.

It is to the interest of the commission merchant to secure the best prices possible. Shippers should be particular to grade and pack their goods properly, ship only the best, in neat, attractive packages, not ship when the market is overstocked, and there will be better satisfaction, and less grumbling all around.

Everywhere.

RURAL SPECIAL REPORTS.

New York.

NEWARK, Wayne County, April 24th.—Since April 3d we have had no rain, wheat and grass are very much in need of some, wheat is looking well, peppermint wintered fairly well; about the usual amount will be set this year. If there will be any change, more oats and less barley will be put in this spring. Although the price of potatoes to-day is but 13 to 18 cents per bushel, there will be fully as many planted as last year. Onions also will have about the usual acreage. No prediction can be made regarding fruits, as yet. Prices: wheat, $1; corn 45 cents; oats, 32 cents; peppermint oil, $2.15; potatoes, 18 cents; butter, 18 cents; eggs, 11 cents. W. H. K.

Pennsylvania.

LIGHT STREET, Columbia County, April 23.—Wheat in this section is somewhat spotted from being drowned out in low places. Spring has been early and prospects are good for fruit; but we have just had frosts that made ice, so we cannot tell what effect it will have on fruit blooms. Bees are in splendid condition. There has been no winter loss and all are strong and healthy. H. H. B.

ANSWERS TO CORRESPONDENTS.

RUPTURED STOMACH IN A STALLION.

J. P. M., Nelson, Ohio.—My Norman-Percheron stallion appeared well and in good health up to the evening of February 12th. Next morning the first indications of sickness were noticed when he refused to eat more than one-half his feed, which consisted of two quarts of corn and oats chopped and two quarts of oats given regularly twice a day. He appeared dull during the day and still refused to eat or drink. The following morning he appeared worse. He would lie down and then get up, changing from one position to another. A dark semi-fluid mixed with

oat hulls and small pieces of hay and straw of from one-quarter to one-half inch in length kept continually flowing from the nostrils. This flow varied, being sometimes heavy and sometimes light. Its odor was very offensive. He had a staggering gait and seemed ready to drop when attempting to walk. He appeared to be in no perceptible pain. His breathing was good and clear, but a rumbling sound was noticeable throughout the bowels, and there were tremblings and twitchings about the breast. The following day he became more restless and his general appearance was worse. The next morning he was in very great pain, lying down about half the time and groaning so as to be heard quite a distance. A part of the time his breathing was quite good. He made several strange movements as if trying to vomit. The symptoms remained about the same, only growing worse until nine o'clock at night, when he died. What was the disease and what should have been the treatment?

ANSWERED BY DR. F. L. KILBORNE.

In my opinion the horse died of rupture of the stomach. While the symptoms are not those that commonly follow an extensive rupture of that organ, in which case death usually results in a few hours, they are the symptoms of a form of rupture that occasionally occurs, in which the stomach is only partially or slightly ruptured. With ruptures of this kind the horse may live two or three days. A careful autopsy ought to have been made on the animal. There is no treatment for ruptured stomach. The lesion is fatal. When the animal is in great pain, the suffering may be relieved by hypodermic injections of morphine. All medicines by the mouth usually aggravate the symptoms. Since rupture of the stomach is almost invariably fatal the attention must be directed to preventive measures rather than treatment. The lesion occurs most frequently in the heavy draft horses and in all classes usually is the result of faults in diet or management. It is very liable to occur when the stomach has been overloaded with food upon which it is unable to act. Fermentation results, gases are formed which distend and finally rupture the stomach. Other common causes that may be mentioned are, a too sudden change of feed; drinking a considerable quantity of cold water on a full stomach, and severe labor after a full meal. The walls of the stomach may become weakened by chronic indigestion or other imflammation so that they are more easily ruptured. In fact any gastric derangement renders the horse more liable to a ruptured stomach because more susceptible to the various causes that tend to produce the lesion.

TO PREVENT A COW FROM SUCKING HERSELF.

L. R. H., Dighton, Kan.—1. I noticed that the brush on the tails of some of my heifers was twisted. On examination I found a soft place about two inches from the end of the tail, which gave the appearance of being unjointed. Does this indicate disease, and if so what? 2. What will break a cow of sucking herself?

ANS.—1. It is of common occurrence, and does not indicate disease. 2. One of the simplest and most effectual methods employed to prevent a cow from sucking herself, is a block worn on the nose. For this purpose take a block four by six inches and one-half to five-eighths inch thick, of basswood or other light, tough wood. Near one edge bore two 1½-inch auger holes, so that they will overlap about one-half inch, and cut within about three-eighths inch of the edge. Then cut an opening five-eighths to three-fourths inch across, according to the size of the animal's nose, through to the edge of the block. Carefully round all the corners so that they will not make the nose sore. Drive two wire nails to prevent splitting. To attach the block, hook one point in one side of the septum of the nose, and crowd the septum through into the opening, so that the block will hang on the nasal septum. This will prevent the cow from reaching her teats with her mouth, but will not interfere with eating. Should the block be lost or broken apply another.

CUTTING "SEED" POTATOES.

C. S. H., Holabird, Dak.—When is the best time to cut seed potatoes? Should it be done immediately before planting or some days before? How do large and skillful potato growers cut the "seed?"

ANS.—The R. N.-Y. has experimented somewhat; the N. Y. Agricultural E. S. has also made quite thorough experiments in this matter of determining how long before planting the seed should be cut. Our opinion is that nothing is gained by cutting the seed any considerable length of time before planting. As soon as a potato is cut and exposed to the light and air, the cut part begins to shrivel and soon to dry up or decay. This is avoided by means of the soil moisture. If potatoes are cut more than a day or so before they are planted, it is probably well to roll them in plaster which, in some degree, will lessen evaporation. The smaller the pieces in which the seed potatoes are to be cut, the more we should object to cutting them long before they are to be planted. The R. N.-Y. does not hesitate to advise its inquirer that nothing is lost by planting freshly-cut seed.

Miscellaneous.

J. H. M., Huntsville, Texas.—On page 232 in answer to L. E. H., regarding a sterile cow, the RURAL says: "Then let the cow be served immediately by a common or grade bull—not by a thoroughbred." Under the circumstances, why should not the cow be served by a thoroughbred bull?

ANS.—Because owing to the more vigorous powers of procreation usually possessed by a good common or grade bull, as compared with a thoroughbred, there is more certainty of securing a fruitful service, if the cow is not really sterile.

DISCUSSION.

COLLAPSE OF THE GREAT MEAT SYNDICATE, AND BEEF INSPECTION LEGISLATION.

T. H. T., SIOUX CITY, IOWA.—In the RURAL of April 20, an editorial tells of the collapse of the American Meat Company, and Armour is blamed for the checking of this new monopoly. In this I think the RURAL is mistaken; for I believe that the popular feeling against these meat companies, as evinced by the growing interest in the passage of the State Inspection Bills, as adopted by the St. Louis Beef and Pork Convention, has cooled the ardor of the meat ring, for they know that the farmer, the King of this Nation, is against them. Armour, as a monopolist, seeing what was for his best interests, no doubt advised the stopping of any more investments that would tend to centralize the beef trade, and I think that, instead, he will now build small killing houses wherever the State passes the Inspection Bill. This new mode of monopolizing the meat trade will be very hard to control and the result will be the forcing of the meat trade into the hands of the many who will have their agents in various parts of the country contracting their beef, or cattle rather, weeks ahead of delivery, thus making a more safe and reasonable basis on which farmers, feeders and consumers can depend. Then the profit will be more evenly divided between the grower and feeder, the butcher and the consumer, legitimate operators who should, without the action of any monopolists, co-operate for the mutual benefit of all. New York should pass the Inspection Bill such as Minnesota and other States have. For the first time has the farmer discovered a method by which the meat monopolists can be controlled. I say "the farmer," for this is true. No butcher should receive the credit of this wonderful move. It is the farmer and no one else who originated it. The beef ring desires that the local butcher should be considered the originator of this movement, thinking by these means to make it unpopular; but his attempt will not succeed; for it is not the local butcher but the farmer who demands State inspection.

R. N.-Y. Although the popular feeling is very decidedly against monopolies of all sorts, yet it was certainly, as a general thing, in favor of the establishment of the "American Meat Company." The reason for this is on the surface. The "Big Four" now hold a monopoly odious and oppressive alike to the producers and consumers. Within the period of their reign they have depressed the price of beef cattle so much in the East as well as in the West that there is only an infinitesimal margin of profit to reward the producers. Absolutely controlling the two greatest cattle markets in the country—those of Chicago and Kansas City—and partly controlling the other Western live stock markets, Western stockmen are forced to sell to them at their own figures. If they refuse to do so at Kansas City, and carry their stock to St. Louis or Chicago, they are there met by the agents of the same parties, who have been advised of the transactions at Kansas City, and the unfortunate recalcitrants find, at the end of their journey, that, taking into account the freight charges and other expenses between the two places, they must accept for their cattle considerably less than was offered to them on the Kansas line. Recent Congressional investigations have shown that the stockmen of the West have lost millions of dollars through the unscrupulous machinations of this giant monopoly. It is also destroying altogether or greatly injuring home markets by supplying dressed meat from Kansas City or even Chicago as far west as Colorado cheaper than meat can be profitably furnished by local butchers who pay a fair price for their stock, although the syndicate's meat may come from animals raised in Colorado, and have paid freights both ways. The enormous profits of the monopolists enable them to do this for a time, so as to break down the local dealers, and then they can put up prices high enough to make large profits besides making up for what they failed to gain during the period of depression.

They pursue the same policy in the East with regard to the dressed meat trade. The enormous savings they now make at the slaughtering centers, owing to the low prices which they pay for cattle; the great economical improvements made of late years in the methods and appliances for slaughtering, and the utilization of every particle of "offal" much of which formerly went to waste, would enable them to sell meat to consumers at an extremely low figure; but they offer it at prices only a trifle lower than those of local butchers—just enough lower to break down the latter; but even this decrease is sufficient to depress the prices of home-raised stock to such an extent as to render the raising of butchers' cattle in the East hardly profitable save under exceptional conditions. For these and some minor reasons, the Big Four monopoly, which buys over half the cattle offered in Kansas City and two-thirds of those offered in Chicago, has incurred a great deal of odium among the general public, and especially among stock raisers.

The public therefore was disposed to look upon the new enterprise less as an addition to the monopolies from which it is suffering than as a hopeful rival of the odious Big Four. Rivalry is death to monopoly when rivalry is of a brisk, healthy and powerful character. The new enterprise promised close competition in the near future within a wide area, with a strong tendency to constant increase. Moreover, the success of one undertaking of the kind would be a strong incitement to the organization of others, just as the success of the Southern Cotton-Seed Oil Company, started a little over a year ago, is just putting into the field a number of the other rivals of the hateful Cotton-Seed Oil Trust. Armour, as a clear-headed, extremely skillful business man, saw all this, and, very properly from his own stand-point, used all his influence, not, of course, personally—for he was then in Europe—but through his agents to smother the threatening rival, like a baby, at the hour of its birth.

With regard to the "Beef Inspection Bills" which have, within the last few months, been introduced into the legislatures of many States, they are all substantially, if not verbally, of the same character, being all formulated on the basis agreed upon by the joint committees of the conventions of butchers and cattle-growers, held last winter at St. Louis. The main object of all is to protect the butchers and cattle owners of each State from the disastrous competition with the Big Four, though, equally of course, due regard is paid to the health of beef consumers, liable to be endangered by the possibly deleterious nature of the dressed meat supplied by the monopolists. So far as heard from, the bills have been passed by the legislatures of New Mexico, Colorado, Kansas, Missouri and Minnesota, and rejected by those of Ohio and Pennsylvania; while they are still before those of New York and several other States. Judging from past experience, the proposed legislation will probably meet with success in those States in which the raising of beef cattle is a dominant industry and where the population of the country is more numerous or influential than that of the towns; while it is likely to meet with defeat in those States where these conditions do not exist. What the Big Four will do in States where inspection of beef cattle is provided for by law at the places at which they are slaughtered, remains to be seen; but, judging by the latest advices from Minnesota, it is not unlikely that they will establish slaughter-houses at various points within the borders of these States, where such depots would be likely to pay.

CHEMICAL FERTILIZERS IN OHIO.

T. B. TERRY, SUMMIT COUNTY, OHIO.—Some weeks ago the RURAL had a "symposium" on the value of chemical fertilizers for Western farmers. In Ohio we have considerable land that is quite level and very rich. Then again, we have land that is gently rolling, but clayey and not considered very fertile. Also in part of the State, the country is very rolling, or hilly, and the soil when brought under the plow is now exhausted of its fertility to such an extent that it does not bring paying crops. Now at the institutes we hear almost nothing about chemical fertilizers when in counties where the soil is of the first kind. In fact plenty of the farmers do not yet save their home-made manure with any care at all. Tile draining is the all-important subject with them. Fertilizers would seldom show where they were put, and less often pay on such soils. On lands of the second kind fertilizers are more used, and more than half of the farmers who express their opinions at our institutes think they pay. The more clayey the land the better the results, as a rule. I have heard of numerous instances, and seen some, where on such soils fertilizers were the making of the wheat crop. On a strip where none was used the wheat was a failure. This was in a poor year for wheat—when it winter-killed badly. On lighter soils in the same locality, fertilizers usually seemed to do no good whatever.

In the Southeast part of Ohio, where we could walk for days just up and down hill, almost without finding a level acre, commercial fertilizers seem to have usually paid well for a time. But we cannot help doubting the wisdom of plowing such lands and cropping them any more than is necessary for reseeding purposes. To sum up all that I have seen and heard in regard to use of fertilizers, I would advise every farmer to test the matter on his own farm and know what he is doing, in the first place. It is the fashion to use fertilizers in some parts of our State, and very many follow the crowd, and doubtless often to their loss. I know some high authorities have taught that chemicals are just as truly plant food as stable manure. Theoretically this is so. Practically there is a hitch somewhere. I have seen fertilizers make a good crop (there being a total failure where none were put), and within two miles a first-class complete fertilizer, freely applied, showed no result whatever. Good stable manure would have shown where it was put, and if for any reason it did not do so in the first crop it would surely in the following ones. Do not leave a little strip without fertilizers and guess at the difference in yield. Make your experiments by the acre and give the scales and half-bushel a fair chance to tell the story. I have seen two fields of wheat side by side, one looking far better than the other; but the other turned out the most grain.

In the second place, if fertilizers brought enough extra crop to pay on my farm, I would not get into the habit of depending on them too much. I would rather use them to get a good grain crop and a heavy stand of clover, on our poorer soils—to give me a start—and then depend on the clover and the careful saving of all home manures as much as possible. I would recognize the fact that I had to compete with thousands of farmers who had rich farms, and who paid out nothing for fertilizers, and that if I wanted to live as well as they, I couldn't give a large slice from every crop, to outsiders. Probably no ordinary farmer in Ohio, ever put on to an acre of land at one time in the shape of fertilizers as much real fertility as is contained in an acre of heavy clover roots. Should he attempt to cover his farm with chemical fertilizers, at any such rate, he would probably "not only have to mortgage it, but the sheriff would foreclose the mortgage and some one else would have a rich farm." But if he only uses a little fertilizer to give him a wheat crop and a heavy growth of clover, he gets his soil filled with fertility almost without cost, and can have a rich farm himself, particularly if he pay close attention to the saving of home made manure.

From the above can, perhaps, be gathered a hint why commercial fertilizers do not pay on my farm. After several years of careful experimenting I would not pay the freight on a car of fertilizers for all the good it would do. Three tons or more of clover roots per acre (dry weight, turned under once in three years, with what manure we can make, is heavy feeding. To buy what these clover roots contain would cost me hundreds of dollars a year on my little farm.

Now I state only what I know when I say that the farmers in the sections of Ohio where fertilizers are most used, almost universally waste more or less of the home-made manure under or around their barns. This loss in very many cases amounts to one-half or more. What sort of business management is this? So carried away do some get as to say that they can hardly afford to draw out their stable manure. Of course, when feeling in this way they will pay little or no attention to the saving of the liquid or most valuable part. What would they think of a dairyman who should milk his cows, set the milk, throw away the cream, save the skim-milk, and then buy his butter? But that is essentially what they are doing when they let the cream of their manure go to waste and then buy fertilizers.

DO I KNOW WHAT I'M TALKING ABOUT?

L. T. P., INDIANOLA, ILL.—While painting at the home of a wealthy farmer, he said:

"What will you paint about an acre of shingled roof for?"

Said I "it is not a desirable job; I'd as soon paint an acre of sod ground." For paper on which to figure the cost I stripped the wrapper from a copy of an agricultural paper. At the same time I remarked:

"That is a good paper."

Said he "if you think so, just tell the village postmaster to put it in your box. I don't want it to come here any more."

"Why did you subscribe for a paper you don't like?" asked I.

"I was up to the fat-stock show and I just gave a fellow a dollar to get rid of him and his paper. It has too much to say about the tariff." While he was telling me this I looked in the paper and the first lines that met the eye told of two years' satisfaction from painting the shingled roofs of the Michigan Experiment Station, with crude petroleum at a cost of nine cents per gallon. I got that paper into my pocket for fear he would see it, and said:

"I'll paint the roof for $1.50 a square (10 by 10 feet).

Said he, "heave ahead, I'll board you and your horses." To make a long story short, that one copy of a farm journal made me $112 on that job, and I've worked it many times since. But the tariff talk physiced him. If he had read it "for revenue only" and a knowledge of his business, it would have been money in his pocket. Has it ever occurred to you that mechanics regard their trade journals as sacred? How about the farmer and his trade journal? Has it ever occurred to any one that mechanics keep secret any trick or money-making device of the trade? How about the average farmer? We have fields here that have been in corn culture since the war steadily every year—only 24 years. Just hint rotation of crops and you'll be told to "shut up." I'm watching a few farms as a naturalist watches a cocoon,. to see just how long corn will grow profitably year after year on a sucked-out soil.

EFFECTS OF LIMING ON CABBAGE, POTATOES AND GRASS.

A. J., LINCOLN PARK, N. J.—In July last, I plowed up a rich strawberry patch, first applying a good dressing of manure; after plowing, I applied a good coat of lime; put fertilizers in the hills; then set out with cabbage plants, having taken the plants out of a bed where four to six seeds had been sown in hills. The whole patch produced the worst club-rooted cabbage I ever had. There wasn't a good head in the whole plot; while on other patches close by that I did not lime, and the soil of which was not so rich, I had splendid, large cabbages: not a club-root to be seen. I had not grown cabbage on the patch for nine years. Can it be the lime that caused the trouble? Henderson and others recommend lime for cabbage. Four years ago I planted four lands of potatoes. On two I applied lime; on the other two, none. Where I applied the lime I had scabby potatoes; on the other lands they were smooth. One of my neighbors had the same experience. My land is low, flat—a dark, sandy loam, well surface-drained. I can grow good crops; but the land naturally runs to horse sorrell. Early in the fall of 1887 I seeded down two acres with Timothy. At the time of seeding I applied 24 tons of New York horse manure. The ground had previously been well manured for cabbage and potatoes. The grass came up thick and grew finely that fall; in the spring of 1888 it started out well, but after growing to a hight of six to eight inches, the ends of the blades turned yellow, and the crop did not grow much more, although last season was a good one for hay. There was a considerable amount of horse sorrel in it. I had the same experience two or three times before. The cause is a mystery to me, for I can generally grow heavy crops of grass. Can it be that the land needs lime for grass; and could the lime cause the club-root in cabbage.

"FLOUR OF SULPHUR" *vs.* "FLOWERS OF SULPHUR."

L. B. F., MARLBORO, N. Y.—In a recent number of the RURAL NEW-YORKER mention is made of "flour of sulphur, more commonly known as "flowers of sulphur." This may not be intended to mean that the term "flowers" is incorrect, though some readers may so interpret it. There seems to be a wide-spread and not unnatural misapprehension concerning these expressions. The word "flour" describes the finely divided sulphur so perfectly that many people regard the term "flowers of sulphur" as a vulgar error. It is quite certain, however, that "flowers of sulphur" is at least historically correct; and the same expression is found in other languages than English. The Latin name of the substance is "*flos sulphuris*;" the French is "*fleurs de soufre*;" the German, "*Schwefelplumen*;" all of which means literally "flowers of sulphur." "Flour of sulphur" would be "*farina sulpharis*" in Latin "*farina de soufre*" in French and "*Schwefelmehl*" in German, expressions which the writer, at least, has never met. Similarly the term "efflorescents" is applied to crystals such as those of blue vitriol which crumble to a fine powder on exposure to the air. The adoption of the term flour in place of flowers of sulphur is an error similar to that involved in the present spelling of the words "causeway" and "sovereign" which are so spelled because of the existence of the English words "ways" and "reign" with which they have really nothing to do, being derived from the French words "*chausée*" and "*souverain*." Of course, the word "flour" is itself derived from flower, so that it is of little consequence which is applied to this form of sulphur, but it seems desirable to assure those who continue to call it "flowers of sulphur" that they are not thereby committing a vulgar error, but are using the correct name of the substance.

FRUITS AND FRUIT CATALOGUE.

P. H. R., DOWNIEVILLE, CAL.—Very many suggestions were made to my mind by the RURAL's late Fruit Special. What made it more particularly interesting to me is the fact that I have lately become possessed of a beautifully situated, but totally unimproved place in the lower Sierra mountains, and I am desirous of filling it with fruits of the best quality, and everything good or beautiful. Let me suggest that had the writers who contributed so much to the value of that special number, mentioned the peculiarities of climate as well as soil, necessary to the perfect production of fruits of which they wrote, what they said would have been of much more practical value—to me at any rate. Another point which remained unnoted was in regard to irrigation, whether all required the same amount of moisture in the soil. When I saw the caption of the article and the array of contributors, I felt as if that number would be worth $500 to me. Now I feel as though I should be compelled to lay out that amount extra, to make sure of getting the things best suited to my location. To make matters worse, I have lately examined one of the catalogues mentioned in the RURAL as coming from a firm "everywhere respected," and I find by comparing the last one with those one or two years old, that one "cut" serves to illustrate both the Crescent and Atlantic strawberries; another serves for Bubach and Jewell; while another "cut" *cut in two*, serves for the Ancient Briton blackberry and Lucretia dewberry.

PLANTING TREES FROM THE NORTH OR SOUTH.

"W," TYRONE, PA.—An old question in tree culture which still stands unsettled is whether one should prefer for planting, trees grown further North or further South. I received some young trees, (mostly peach) from a nursery in Huntsville, Alabama, where they had apparently just been dug from open ground, while here, at their arrival, the soil is frozen firmly 30 inches deep, and covered by 20 inches of snow, while the air is nearly at a frozen temperature. But they came in good condition from the close box in which they had been carried, and are now in sand in a cool cellar ready for the prime advantage of being set out just as soon as the soil opens and dries to admit of it. Looking at their bright, fully ripened wood, and their peculiarly numerous buds or short-jointedness, the old question came into my mind. It seems that in the South, where the season of growth is long and that of rest short, more buds are formed and better formed than in the far North, where growth, when it does commence, goes on with a rush, and the internodes or spaces between joints are longer, more slender, and less firm, owing to the hurry of the work, also fewer in number, owing to the shorter season.

ROAD WISDOM.

P. K. S., PRATTSBURG, N. Y.—"Brevities" deems it, in the RURAL of April 23, "unfortunate that the time for doing spring's work, and working roads," conflict. Do they? Should not the road work commence as soon as the frost is out of the ground while the land is too soft and wet to be plowed for crops? The tops of the knolls can then be easily plowed and the stones picked out and drawn, with those in the track and by the road-sides, to low places to build sluices and grade up the low places and be covered with the dirt from the knolls. More thought ought to be mixed with the work on the roads. I saw a "path-master" spend half a day with a team digging out a round stone from the beaten track at the foot of a knoll, and then he drew it to the side of the road to scare teams, when a little thought and half the work would have partly graded down the knoll and covered the stone beyond resurrection. Some farmers begin dragging a hill side, at the foot, and drag across and up as if they were plowing it with a side-hill plow. Is that the best way? If not, why not?

D. A. S., UNCASVILLE, CONN.—Starr's Beauty potato is a sport from the Early Rose, and is of nearly the same shape, but the color is more of a blush, and the vine leaves are more crimpy. I think it is a little earlier, and a much better yielder, as there are not half the number of small ones in the hill. I have planted it two years. Last season I planted on the same piece of ground, Early Maine, Early Sunrise, Early Rose, Empire State and the Starr, and the last were by far the best. They are not as mealy in the fall as the Rose, but more like Burbank's seedlings. This is my experience with *nothing* but Stockbridge potato fertilizer, last year, on land which had been in grass over 12 years, and the grass had run out.

What Others Say.

BASIC SLAG AS MANURE.—The London Agricultural Gazette alluded to a paper read by some distinguished specialist on basic slag as a manure. In it he entered into carefully-considered details relating to its manufacture and composition. He pointed out that this manure not only varies very greatly in its composition, the percentage of phosphoric acid ranging from 10 to 20, that of lime from 40 to 60, that of ferrous oxide from eight to 10, and that of manganous oxide from four to five, but the presence of considerable proportions of oxides of iron and manganese he represented as a great draw-back to the benefit which otherwise might be expected from the use of basic slag. He referred to a number of patented processes for freeing the manure from these objectionable oxides and producing a more soluble fertilizer, and until one of these methods has been proved successful, he said he could not advise farmers to give up superphosphate in favor of basic slag. He specially warned them against mixtures of slag and superphosphate. The best sample of this slag he believes to be precipitated phosphate, containing close on 70 per cent. of lime, without anything injurious in it, and in all respects a good article. The process by which this manure is prepared is the invention of Scheibler, a German chemist, and a considerable trade in the preparation is done on the Continent, German buyers taking all the basic slag they find available in this country. After all, then, the desired conversion of basic slag, as far as safety in its use is concerned, appears to have been accomplished.

SKIM-MILK AS A FOOD FOR HOGS.—Prof. Henry says, in the Breeder's Gazette, that 1,000 pounds of average milk contain:

	POUNDS.
Caseine	32
Fat	36
Milk sugar	45
Mineral matter	7

Removing the cream in skimming takes away all of the fat except three or four pounds, but the caseine, milk sugar and mineral matter are practically all left in the skim-milk, together with the residue of fat. Nature designed milk for the young calf, and it contains elements for the growing of the hide, hair, bones, and muscles as well as fat, so that the animal can be developed symmetrically. In removing the fat, we have taken out the principal constituent of the milk, which goes to make the fat of the body, but have removed little or none of the muscle and bone-forming elements. It is evident, then, that although we may have thought skim-milk a very poor article of food, since to our own taste cream seems the best part of it, it is in reality very nutritious, and may be made very valuable on the farm for feeding purposes if properly managed. To get the best results from it we must remember what is left in the skim-milk after the removal of the cream, and endeavor to supply the lacking part so as to bring it back to something like its original composition. In skim-milk are the elements for the bones and muscles of our farm animals, but there is a lack of fat and energy food. Indian corn supplies this for the least money, and so combinations of Indian corn and skim-milk will be found to afford a most economical ration for young pigs, shotes, and breeding stock where good bone and muscle are essential to the highest results.

A NEWLY-DROPPED CALF.—Prof. Robertson, according to the Farmers' Review, says that the calf born between September 1, and December 1, is the best to raise. It gets a good start before winter, winters well, and in the spring grows finely. A cow should lick a calf for at least half an hour when it is first dropped; this will set the heart to working properly, start digestion and put the whole system in proper operation. A calf, either bull or heifer, should show a good escutcheon. In a cow, other points may be seen from which to judge; the teats should be set wide apart and stand out like four legs on a properly made stool. The shape of a calf may be largely changed by feeding. If kept fat it will develop a rounded body, while if fed so as to heep healthy and growing, it may be molded into the desired form for a dairy animal. It should have its mother's milk the first three or four days, as it is designed by nature to set the calf's system in proper condition. After it is a week old it should have sweet, skimmed milk, and be fed dry, ground oats. Eating the ground oats dry produces saliva to aid digestion, insures a healthy system and stimulates growth and good habits. After it is from one to three months old, it may be fed to develop its digestive organs. It should then have plenty of very digestible food of a kind that will aid in forming bone and muscle and add to its general growth—not of a kind that will develop fat. Thus a large deep belly will be developed, a desirable feature for a dairy cow.

WIDE-AWAKE ITEMS.

MR. BOWKER says that any one who will guarantee the concern with which he is connected, a net profit of two dollars per ton of fertilizers on the output of his factory for 10 years, may have any surplus which accrues above the amount.....

Two dollars a ton on a $40 fertilizer would be a five-per-cent. profit. On a $20 fertilizer it would be a 10-per-cent. profit.....

DR. HOSKINS says, in Garden and Forest, that he has for several years been interested in a little native plant found, according to Mr. Pringle, in few localities in Vermont—the Strawberry Blite—Blitum capitatum. Spinach will not winter in his grounds, but the Blite does not mind the cold, however severe; and as it starts into growth the moment the snow departs, it makes as early greens as the dandelion, and to his taste quite as good as spinach. The Blite is a pretty persistent weed, so far as reproduction from seed goes; and the seeds are almost as small and quite as numerous as those of purslane, yet it is easily killed with the hoe. The brilliant crimson color of its pulpy but insipid fruit, with its abundance, makes the Blite a pretty plant in the flower-garden, when well grown, and, we may add, these brilliantly colored fruits last for a long time.....

MRS. KEDZIE, in the Industrialist, Kansas, reports that she buried some butter in a jar last May, eight feet deep in the ground, and has but lately dug it up, and found that while it had "aged" it was still as far from rancidity as when first buried. The color was still the same as when first made. Still it was not quite as palatable, for table butter, but for other uses it is believed, by her, to be quite as good as the fresh-made. Hoard's Dairyman guesses, that it would prefer to submerge it in pure brine, and keep it in a cool cellar..

THE R. N.-Y. is not certain as to the yielding powers of Boley's Northern Spy potato. Its shape will condemn it.....

AND the same may be said of Monroe County Prize.....

PROF. W. J. GREEN, of the Ohio Agricultural Experiment Station, says (in the Ohio Farmer) that the Early Oxford potato is not widely known, but it gives indications of being the most productive variety of the Early Rose class.....

THE OHIO JUNIOR gave lower yields in nearly all cases at the above Station than any other early variety, except the Early Ohio, the two being about equal in productiveness. As compared with Early Oxford, it stands 106 to 200 in three trials, or little more than half in point of productiveness. Empire State and Summit stand at the head of the list and are about equal in prolificacy. Taking the evidence of these trials, Mr. Green ranks some of the standard varieties in the following order as to productiveness: Empire State, Summit, Early Oxford, Pearl of Savoy, Potentate, Puritan, Lee's Favorite, Early Rose, Charles Downing, Early Standard. Early Albino, Early Ohio, Ohio Junior.....

THE following appeared in the R. N-Y. of recent date:

"Mr. C. S. Cooper thinks well of the Patagonians. He is an experienced poultry raiser. His eggs were received from the same source as were the RURAL'S eggs. These, as our readers know, gave us a grand mixture." To this Mr. Cooper replies:

"Your notice of my Patagonians may mislead the reader. From the eggs procured from Samuel Wilson I did not get one pure-

bred chicken. I killed them all for the table. The stock I am breeding from were bought from N. B. White, Norwood, Mass. .....

PURE RICH MILK diluted with 20 per cent. of water will indicate by the lactometer test precisely the same as the standard quality of milk, says the dairy authority, Henry Stewart. Skimmed milk with 10 per cent. of water will indicate by this same test precisely the same as pure rich milk unadulterated, while the richest strippings will indicate a poorer quality than skimmed milk with 20 per cent. of water when tested by the delusive method of the lactometer. It is very clear, then, that this instrument in the hands of an official who does not understand its character, is worse than useless, and may be made the means of the gravest injustice and injury to an honest dairyman, while a dishonest man may actually use it to cover up and conceal a large adulteration. For it is quite easy for such a person to add salt or soda to the milk and an emulsion colored so as to give the viscidity and appearance of pure rich milk, and so pass off skimmed milk upon the public without detection by this illusive test of the lactometer.....

A LACTOMETER is no "lactometer" at all; it can no more measure the quality of milk than a barometer can. Its use is to ascertain the specific gravity of fluids, and as skimmed milk is heavier than pure milk, and the richer the milk is in cream the lighter it is, it is easily seen how unjust and misleading this instrument may be when applied as a test of the quality of milk.....

THE UNIVERSITY OF ILLINOIS EXPERIMENT STATION last year planted corn from one to six inches in depth. The largest yield was from the row planted one inch deep; the next largest from the row planted three inches deep and the least from the row six inches deep. The best depth to plant, so the bulletin says, will depend largely upon the temperature, moisture, and mechanical conditions of the seed-bed at the time of planting—three conditions which are, probably, rarely exactly similar in two different places or seasons. In the above experiment, these conditions were all favorable to the early growth of the corn plant; and in such a case the depth of planting, between one and four inches, would make but little difference.....

THE above station found by one series of experiments that shallow cultivation for corn gave better results than no cultivation and that no cultivation was better than deep cultivation.....

PROF. MORROW says that great as are the difficulties of obtaining satisfactory results with small plats, there are even greater difficulties with large plats. It is much easier to obtain like conditions of soil with 80 one-fortieth-acre plats than with 80 plats of an acre each. The expense of testing the requisite number of varieties in other directions than that of the yield per acre would, of course, be great on large plats and probably not commensurate with the results.....

JUDGING of a single experiment made by the Mississippi A. E. S, it would appear that salt fed to cows increases the flow of milk.....

ANOTHER TRIAL shows that a gain of 244 pounds of milk was made with five cows in two weeks, or 2½ pounds a day, when milked by a thorough milker as compared with the results of the same work done by a careless, indifferent farm hand.....

AN IOWA DECISION invalidates all notes given for Boheman oats.....

PROF. A. J. COOK, as reported in the Farmers' Review, knowing the decided preference of the curculio for the plum, advocates the planting of plum trees in the apple orchard. The curculios will collect upon these trees and can be destroyed much more easily than if scattered over the whole orchard. The best method of destroying the curculio seems to be to spray the tree very thoroughly with a mixture of one pound of London-purple to 200 gallons of water; although if the object be simply to drive the curculio away a mixture of one pint of carbolic acid with 50 pounds of plaster, thrown over the tree, seems to be quite effective. The first spraying should be done just as the blossoms are falling, and should be repeated twice at intervals of about 10 days. The importance of not spraying until the blossoms had fallen, because of poisoning the honey bees, was emphasized in the address.....

BREED AND FEED to a cow, as Prof. Robertson puts it, are like two wings to a bird—one alone is of little use. The simile might well be applied to partial fertilizers when put on land that needs a full ration.....

SEC'Y FITCH, as reported in the N. E Farmer says that the cost of milk on the farm is not less than three cents, the cost of selling is about two cents, leaving three cents of the amount paid by the Boston consumer to be divided as profit. Of this the contractor takes one cent, the peddler two cents, and the farmer gets what is left,—nothing.....

Cows can be kept continually on silage without pasture, says Mr. Gould in the Ohio Farmer. In his recent trip to New York he met Mr. Rodgers, of Binghamton, who has 95 cows that have not seen any pasture for five years. They eat silage and about three pounds of clover-hay per day for 365 days in the year. The cows were certainly fine ones, and when one by chance drops out of the dairy she is soon made fat enough on silage and bran, for the butcher.....

DIRECT.

——FARM, FIELD AND STOCKMAN: "It occurred to me several years ago that soiling cattle from the green crops that grew upon the land could be done with less expense than to pasture the herd. Of course, many will think that this is a poor way of keeping cows, and we often hear the stereotyped objection, 'They ought to have some exercise.' I am satisfied from my own experience, and it has been proved by repeated experiments, that animals that chew their cud do not require exercise other than the exercise of chewing."

——HUSBANDMAN: "When the price of onions falls below 20 cents per bushel it will pay to feed them to stock."

——BREEDER'S GAZETTE: "A good cow gives not less than 5,000 pounds of milk annually, from which there are taken out, say, 250 pounds of butter, all of the remainder being either skim-milk or buttermilk. Valuing this at 25 cents per 100 pounds, we have about $12 to represent the value of this by-product, a sum which should stand to the credit of the cow. The dairy farmer should make pig-raising and hog-feeding an adjunct to his business, and will find no small part of his profits come from this line, if it is managed intelligently."

——COLMAN'S RURAL WORLD: "Why every man praises his fellow to his face and condemns him to his back, is more than we can tell."

——PUCK: "About the N. Y. Board of Aldermen nobody has any delusions. It is mainly composed of irresponsible men of no character—many of them liquor-dealers They buy their places with money and patronage, and they themselves, for the most part, may be bought singly like cabbages or in bunches like radishes."

——DR. JAMES LAW: "I strongly advocate preventing in some way the damage done by horns."

——PROF. GEO. H. COOK: "Some varieties of wheat will yield five, 10 or even 20 bushels an acre more than others."

——W. H. BOWKER: "Fertilizer firms can not manufacture anything equal to stable manure. It should, however, be applied in its crude state, because the farmer cannot afford to compost it.'

——SUPPOSING that a ton of stable manure contains about 25 pounds of actual plant food, we cannot afford to haul the 1,975 pounds very far for the 25 pounds of actual plant food. In this estimate the value of the manure to the soil mechanically is not considered.

Horsford's Acid Phosphate

Makes Delicious Lemonade.

A teaspoonful added to a glass of hot or cold water, and sweetened to the taste, will be found refreshing and invigorating.—*Adv.*

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has this latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

100 Doses One Dollar

JOHNSON'S ANODYNE LINIMENT ESTABLISHED 1810.

For Internal and External Use.

Stops Pain, Cramps, Inflammation in body or limb, like magic. Cures Croup, Asthma, Colds, Catarrh, Cholera Morbus, Diarrhœa, Rheumatism, Neuralgia, Lameback, Stiff Joints and Strains. Full particulars free. Price 35 cts. post-paid. I. S. JOHNSON & CO., Boston, Mass.

HOW "TIPPECANOE" HARRISON WAS SAVED.

THE battle of Tippecanoe was fought November 5th, 1811, in Indiana, on the banks of Tippecanoe River, on the site of the present village of Battle Ground, between the Americans under General Harrison, and the Indians under the Prophet, Tecumseh's brother.

After the famous battle until the end of his days General Harrison, grandfather of President Benjamin Harrison, was known by the loving sobriquet of "Tippecanoe."

Following his brilliant achievements in arms, now more than three-quarters of a century ago, General Harrison, together with many of his troops, was stricken with disease contracted through lack of proper food, and exposure to the miasma of that section of Indiana, and for a time his life was despaired of. Several of his command lay for weeks suffering the horrors of disease upon the banks of the Tippecanoe River, which rises in a lake of the same name in the northern part of the State, flows southwest 200 miles and empties into the Wabash, nine miles above Lafayette. General Harrison's troops were threatened with decimation, and the skill of the army surgeons was employed in vain to combat a more terrible and deadly enemy than even the hostile aborigines under Tecumseh's brother.

But relief came at last.

General Harrison very sensibly concluded that residents of the neighborhood—nay, the Indians themselves—knew nature's specific for the disease which had prostrated him and many of his command, and instantly set on foot inquiries with a view to ascertaining and applying the remedies. They were speedily found and put to test, and worked like a charm. Under their use the stricken soldiers were promptly restored to their wonted good health and vigor.

The medicines were preparations of simple roots and herbs, based upon very old-fashioned but effective and natural formulæ. Their intrinsic merits have been known and utilized for generations among people living in remote and malarial sections of the country.

Many of these invaluable formulæ have within the last two years come into possession of Hon. H. H. Warner, president of the Rochester Chamber of Commerce, owner of the largest proprietary medicine manufactory in the world, and whose Safe Remedies have conferred a lasting boon upon mankind, being recognized as standard medicines throughout the civilized globe.

In 1887, Mr. Warner, after careful experimenting and trial put upon the market Warner's Log Cabin Remedies, based upon the formulæ which have cured thousands of debilitated sufferers, not only on the banks of the "Tippecanoe," as above related, but everywhere where introduced.

These Log Cabin preparations are designed for an entirely different order of diseases from those to which the Safe Remedies are applied. They are Warner's Log Cabin Sarsaparilla, Warner's Log Cabin Cough and Consumption Remedy, and Warner's Log Cabin Hops and Buchu Remedy. Suffering flees before them as a pestilence flees before the purifying breath of heaven, and they are sold everywhere.

IF YOU WANT **Best Farm Boiler** EVER MADE

For Cooking Feed for Stock, Heating Milk or Water in Dairies, Small Cheese Factories; for Bath-Rooms, Laundries, Scalding Hogs, Etc., address J. K. PURINTON & CO., Des Moines, Iowa.

WM. ROBERTS, M. D. Physician to the Manchester, Eng., Infirmary and Lunatic Hospital, Professor of Medicine in Owen's College, in speaking of kidney disease, says: "One-third die of uremic (uric acid), poisoning. A considerable number of dropsy. One-fifth from secondary pneumonia, pericarditis (inflammation of the heart sac), or pleurisy, exhaustion, indigestion, or the complications of apoplexy, hardening of the liver, bowel ulcers, etc." The foregoing are only a few of the common symptoms of advanced kidney disease, and this explains why Warner's Safe Cure cures so many different symptoms, called diseases, and why it has such popularity. Ask your friends and neighbors about it.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, MAY 11, 1889.

THE price of New York and Brooklyn manure has been steadily going lower for several years. This is accounted for by the fact that the quantity of chemical fertilizers used is increasing every year.

The Osage was the leading musk-melon in Chicago in 1887, *as well as during last year, bringing* 50 *to* 100 *per cent. more than other melons.*—See MR. FOOTE'S article on melon growing, page 312.

President Chamberlain's anti-monopoly articles have seemed to the R. N.-Y. forcibly interesting and they ought to do good· they ought to set people to thinking and to acting. The article this week is the last of the series.

"IF square, hard work shall make my work a success here, my friends will not regret their efforts to get me into the place." So writes the earnest, conscientious Assistant Secretary of Agriculture, Edwin Willits, the late President of the Michigan Agricultural College. Success to you, Mr. Willits, and to Secretary Rusk. We need good, true men in your positions; we need them badly.

MR. T. C. ROBINSON, of Ontario, Canada, writes as follows:—

"I have nothing but good to say of the RURAL. It preaches just the sort of Gospel of Agriculture that I need. I would rather pay $10 a year than be without it. It is worth more to me than all other agricultural and horticultural papers published in your vast empire, combined—so far as I have seen, and I have tasted all the cream."

TEN years or more ago the R. N.-Y. raised many different kinds of so-called cow peas. This crop has been commended for silage purposes. As stated at the time, our cows and horses refused to eat the vines and leaves. Cow-pea hay in the South has a value, as we all know, and the R. N.-Y. stated the fact with hesitation. Now, Professor Shelton, of the Kansas Experiment Station, says, in a late bulletin, "Our cattle refused to eat this forage, either green or cured." Doubtless, as with Prickley Comfrey, farm animals may be educated up to relishing this fodder.

THERE are several varieties of the Purple barberry that hold their purple color during the summer just as well as does the Pissard's plum, and for color of foliage and shapeliness of bush alone, we should prefer the barberry A large proportion of Purple barberry seedlings will have purple leaves. A R. N.-Y. seedling bears leaves as purple in midsummer as in early spring. But Pissard's plum bears plums—small, of a peculiar flavor, it is true—but plums that are relished by some when eaten raw and by all when canned or stewed. Now this plum is the nearest to curculio-proof of any variety ever raised by the R. N.-Y. In fact, it is the only variety we have ever raised that matures its fruit unless the jarring method is resorted to.

Bishop Potter: "The growth of wealth and the prevalence of luxury, the massing of material forces, which, by their very existence, are a standing menace to the freedom and integrity of the individual, the intense swagger of the American speech and manners, mistaking bigness for greatness, and sadly confounding gain and godliness—all this is a contrast to the austere simplicity, the unpurchasable integrity of the first days and first men of our Republic, which makes it impossible to reproduce to-day either the temper or the conduct of our fathers."

THE R. N-Y. has planted two acres of potatoes on the trench system—one acre to Rural New-Yorker No. 2, and the other to Brownell's Winner. On one acre nothing but chemical fertilizer was used, while on the other stable manure was added to the fertilizer. One acre is on an upland, while the other is on lower ground that rarely, if ever, suffers from drought. The planting of the last acre was quite "a family affair." The wife of the family cut potatoes, the hired girl and the young lady visitor dropped the seed-pieces, the hired man scattered the fertilizer, while the "head of the family" filled in the trenches. The horses were just as interested as anybody, the cow looked over the fence in evident appreciation, and the dog seemed willing to give the whole thing his general supervision We all had a good time and went in to supper with surprising appetites.

A JERSEY cow runs in the pasture at the New Jersey farm. Three of the neighbors' cows run in the same field. Thus all the cows eat the same kind of grasses. Grain for these cows is bought at the same place so that we know they get the same kind of grain feed, and they all drink from the same stream. Is the milk or butter made by these cows the same? One might say it ought to be since the food and water are exactly alike for each cow. But, no! The butter made by the Jersey is at least 10 shades darker than that made by the grades and a quart of her milk will make, by actual test, 25 per cent. more cream than a quart from either of the other cows. We can understand why one cow should make richer milk than another—it is impossible to make the Jersey fat, while the other cows are easily made fat enough for beef—but what we cannot understand is that the Jersey should make butter of a deep, rich yellow, while the other cows, from the same food, make light and pale yellow butter.

ANIMALS seldom forget bad habits. Many farmers know this to their sorrow. Halter-breaking horses, fence breaking cows, jumping sheep, and sheep-killing dogs seldom forget how to perform their mischief. One cannot be too careful in the training of a young animal. Firm, yet gentle treatment with a watchful carefulness that makes it impossible for an animal to take advantage of weak halters, broken fences or other helps to mischief should always be employed in the rearing of young animals. Scotch farmers report some curious instances of the disastrous effects of teaching undesirable habits to sheep. In the Highlands of Scotland the sheep are expected to pick their own living during the winter. In ordinary seasons they will do so successfully. Now and then an unusually severe winter occurs, and farmers are compelled to feed hay or even grain. The sheep never forget this extra feeding and expect it ever after. They will not hunt for their food as formerly, but will stand about waiting to be fed even in mild winters. Some farmers are actually compelled to sell such sheep, and buy others that have not been winter-fed.

WHAT are to be the duties of the Assistant Secretary of Agriculture? Secretary Rusk has just defined them. The following Divisions of the Department of Agriculture and Sections thereof are assigned to his charge subject to the reservations mentioned: The Botanical Division and Section of Vegetable Pathology; the Pomological, Microscopical, Chemical, Ornithological, Forestry and Entomological Divisions, together with the Silk Section and the Office of Superintendent of Experiment Stations. The Assistant Secretary will, in general, control and direct the scientific policy and operations of these Divisions and Sections, and all questions and correspondence involving their scientific work will be submitted to him for approval and signature. All such scientific matters, however, in which questions of administrative policy are involved, though primarily subject to the consideration of the Assistant Secretary, are to be submitted to the Secretary for his approval before final action is taken. All matters considered by and all matters originating in any of the above Divisions, in which administrative features or policy are involved will be referred to the Secretary himself. The investigations and experiments in the manufacture of sugar from sorghum are excepted from these rules. The actual work, it is seen, will be under the direction of the Assistant Secretary; while the general management remains in the hands of the Secretary.

THE old battle of the farmers against the union of the State Agricultural College with the State University, or rather the absorption of the former by the latter, raged in the upper branch of the legislature of Minnesota the other day, and once more the farmers were defeated. It was contended on their side that the college ought to be separated from the university, and "carried on according to the original design of the General Government." It was bitterly urged that while the university now gets a large proportion of its support from the Government grants for the college, the former flourishes owing to the paramount consideration it receives; while the latter is dwindling and decaying from sheer neglect. The students at the university, who are, in reality, beneficiaries of the college, affect to sneer and despise the students entered at the latter—the puppies affect to bite the hands that feed them. As the college is kept now, there is nothing to show that it is worth anything; whereas if it had its due, its assets would amount to $1,200,000, and it would be able to run alone without help from the State. Every argument urged against the separation of the two was a plea in behalf of the university—not one cogent reason was adduced in support of any possible benefit to agriculture from the union of the two bodies. It is to be hoped that the advocates of such unions in other States have more honest arguments against separation than those urged by the Senators of Minnesota.

OUR COUNTRY.

NEW YORK City has just finished a most remarkable week. It is doubtful if ever before in the history of the world, any city served as the vent for such a wave of patriotic enthusiasm as came sweeping in from all over the country. It was a week to make Americans doubly proud of their heritage. It was a time calculated to warm the blood of old men; it recalled memories of brave days and noble deeds when history was made at lightning speed. It was a time calculated to fill the minds of the young with patriotic inspirations, and fit them the better for the duties which the future has in store. The city was one vast array of flags. Wherever the eye could turn our beautiful banner flashed into view. And what a magnificent procession was that which passed through the city's streets! It is our policy to cultivate the arts of peace. Foreign nations laugh at our military strength, and yet who that saw the crowds of citizen soldiery passing up Broadway could not realize that every man in the ranks would be followed by 50 others if the country demanded them? And the industrial exhibition was the most surprising of all. Side by side with the rude implements in use 100 years ago, came the marvelous productions of modern times. The growth of industry was shown step by step and the revealing of this wonderful growth was like the revealing of a miracle.

Verily it is a blessed privilege to be known as an American citizen. We live in a goodly country. Witnessing such celebrations, or reading and thinking about them, gives one a broader view of life, and fixes more clearly in mind the great thought that the strength of this great country of ours is founded, not upon the deeds and plans of a few leaders, but upon the right thinking and right acting of millions of common people.

A SHREWD GAME.

THE R. N.-Y. wished to make its Hay Special as complete as possible. There are multitudes of haying tools on the market. Dozens of different mowers, rakes, forks and other implements are offered for sale. "Which one shall I buy?" Farmers often ask this question, and it is one of the hardest questions to answer, because it seems so hard to get an honest opinion from those to whom we are obliged to refer. The R. N.-Y. has not tested all the haying tools that are offered for sale. We are frequently forced to refer questions concerning this or that tool to farmers who ought to be capable of giving a conscientious opinion. We wrote Mr. A. C. Glidden, a well-known writer on agricultural topics, asking him to give a list of the haying tools he had found most useful. Shortly afterwards, the following letter came to hand:

"Gentlemen: We have a letter from A. C. Glidden, in which he says he has received an order from you to write an article on haying tools to be published in your Hay Number. He says he will mention the Eureka as *the* mower, if we will send him $25 at an early day; but if we do not he will mention the McCormick center-draft mower. We do not propose to be blackmailed, and would not under any circumstances submit. EUREKA MOWER CO."

Mr. Glidden was at once asked to explain. His explanation is to the effect that the Eureka Mower Company have not treated him fairly, as he believes, and that he proposed to "get back onto them," and he thought this was a good chance to do so.

The R. N.-Y. has nothing to do with any business difference between Mr. Glidden and the Eureka Mower Company. It is opposed to all schemes for blackmailing or for disguised advertising. If we cannot publish honest, square and conscientious opinions regarding implements, tools or farm methods, we will know the reason why. We do not care for any more communications from Mr. Glidden. We give this case prominence for two reasons: 1. We want our readers to understand that we propose to do our utmost to secure honest and trustworthy reports. 2. Writers who propose to attempt to use the R. N.-Y. as a medium for the payment of private grudges or for stealing free advertising are warned that they will have to stand the consequences. It will be well for readers to bear these facts in mind since many agricultural papers are just now full of just such articles as Mr. Glidden would have sent us.

"We always feel suspicious and doubtful of a woman who does not care for home and home life; there is something lacking. And it is noticeable that love for, and pride in a home, will keep a woman to the right when other influences fail. Let us encourage this home feeling, by all means, for it is one of the safeguards of the nation."—EMILY LOUISE TAPLIN'S Department last week.

BREVITIES.

ALL ABOUT HAY NEXT WEEK.

IN the R. N.-Y.'s estimation nothing is gained by cutting potatoes until planting time.

ON page 312 will be found the views of a number of ensiloists regarding the economy of ensilage machinery.

YOUR cows should be able to give 10 times their weight in milk every year. That is the ideal you should breed for.

THE past winter has given little opportunity to test the hardiness of new plants. All sorts of blackberries at the Rural Grounds are alive to the tips.

"LET the public grumble to some purpose or else stop grumbling. Let the watchword be, a maximum of efficiency, a minimum of cost." Pres. Chamberlain's anti-monopoly articles.

WHAT a fortune awaits the manufacturer who shall first perfect a machine that will cut grain and bind it with a straw band! The "Twine Trust" would soon starve out with such a machine in the field.

DR. T. H. HOSKINS has originated a cross between the Blue Squaw corn of Dakota and his Early Dean Sweet, which is as sweet as the Black Mexican and as early as Cory. The color is nearly that of the Mexican.

WE are going to sow a good quantity of the Thoroughbred Flint corn in drills. This will be cut for the cows during latter July and August. We do not care if the cows stay in the barn all day during the very hot weather.

"IF our government cannot compel these corporations to serve the people economically, impartially and well, it will have to revoke their charters, refund their actual capital and itself do the work they refuse to do economically and properly."

SEVERAL readers of the R. N.-Y. have discussed the wisdom or folly of burning straw. Some pretty strong terms have been used on both sides. The men who advocate this practice will be likely to be a little staggered when they read the "discussion" coming next week.

IF you can raise 20 bushels of potatoes on one-fortieth of an acre, how much more fertilizer or manure and culture can you afford to give the plot than if you raise five bushels? The one is at the rate of 800, the other at the rate of 200 bushels to the acre. Moderate this somewhat and let the question be for acres instead of plots.

WE had always been taught to turn the cows out every day during the winter for exercise. When a boy, the rule, as we now remember it, was that the cows should have exercise, no matter if they froze their horns in getting it. Of late years we have never turned the cattle out on very cold days. During the past winter a German workman insisted that the cows would be better if they were kept in all the time. As he had shown good judgment in other things, he had a chance to prove his statement. We are now compelled to say that the cows are certainly just as well off for not going out of the stable.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

WASHING AND IRONING

Colored Cotton Goods.

TO PREVENT FADING.

SPEED.

Starch-Water Instead of Soap. Bran and Hay Water. Soft Water.

Soap In the Water, Not on the Goods. Dry in the Shade.

Irons Must Not be Too Hot. Iron on the Wrong Side.

Salt, Beef-Gall, Borax, Alum, Vinegar and Sugar of Lead to Set Colors.

Gum-Arabic, Glue and Coffee for Dark Goods.

FROM MRS. A. BATTLES.

The following mode I have had practiced in my family for the last 30 years. It has proven equally successful in washing colored goods of the most delicate colors and finest material as well as those part wool and part cotton. For washing clothing of this kind, we use a *starch water*. I suppose every one knows how to make starch from flour, but as I like, when reading how to do wo k, to have the directions given plainly and fully, I shall endeavor to do so with mine.

Put a kettle on the stove with six quarts of water in it. While the water is coming to a boiling heat, put three pints of flour in a pan, with cold water enough to make a paste; stir until it is free from lumps; pour into hot water and stir until it boils again. Pour half of this starch into a tub, add soft, warm water sufficient for the quantity to be washed. Where the clothes are much soiled, rub some of the thick starch in place of soap. Allow them to remain in the water only long enough to wash; rinse, and starch as speedily as possible. Wring them dry and turn the wrong side out. In summer dry in the shade, and in winter where they will not freeze. For clothes of fine material and with a white ground or for delicate colors, I use laundry starch slightly blued. For blue prints, ginghams or any goods the colors of which are fast, we use a good quality of hard soap, but we never use *soft soap* on any of our colored cottons. Put salt into the water in which black and white goods are rinsed, as it prevents the colors from running. After sprinkling, allow them to lie only long enough to dampen through. We use Mrs. Potts's sad-irons. Iron the clothes on the wrong side, as that makes them look more like new, being careful that the irons are not too hot, as that injures the colors. Rub and press until the articles are perfectly dry.

FROM MRS. N. D. M.

For delicate colors, I make it a rule to wash quickly, with as little soap as possible, and that dissolved in the water, not rubbed upon the clothes. I never wash prints and ginghams in the suds after white clothes, as that makes them look dingy. For any garment reasonably soiled washing in one suds is sufficient. I rub as lightly as may be on the board, after rubbing between my hands, as in too close an acquaintance with the washboard dainty tints and patterns are likely to suffer. Rinse thoroughly, turn each garment inside out, starch—not very stiff—and dry quickly. When dry, damp, roll tightly, and let them lie until the flat-irons are just hot enough to smooth the cloth; an iron too hot is likely to injure delicate colors. For dark and bright colors one must do differently. I will tell you how I laundried a brown-and-gold print recently, and I think the same treatment will do nicely for all dark colors. In water enough to cover the dress well, I mixed a fresh beef gall and let the dress lie and soak in this half an hour. Then I washed it thoroughly by squeezing it in my hands, rubbing it carefully around the neck and sleeves and bottom of the skirt. I rinsed it well in clear, warm water, and then again in another water in which had been dissolved a piece of glue as large as two fingers. I dried it at once on the clothes horse in the kitchen, and when just dry enough to iron nicely, I rolled it while the irons were heating and pressed it at once on the wrong side, and, lo! my dress had regained all its pristine freshness.

FROM J. L. K.

THE weekly washing must be done, and done with th' assurance drear, that 'twill be repeated 52 times every year, for, like Tennyson's brook,

"Men may come and men may go
But we go on forever,"

or, in other words, we are forever washing, ironing, baking, etc. Nothing is denied to well directed labor, and nothing is ever to be obtained without it. There is complete satisfaction in contemplating the weekly washing after it is hung on the line, especially if it was our labor that produced this immaculate cleanliness. It should therefore be our constant study and aim to bring forth the best of results, with the least labor, so that we may have more time to spend in our favorite pursuits.

To wash colored cotton goods so as to prevent fading, I make suds of "Jaxon" soap, rub them in this, wring and put them in a tub of clean, warm water, turn each garment and rub again through this; then, if I wish them to avoid that stiff, shiny, fresh-from-the-laundry look, I put cooked starch in the bluing water; then hang on the line, wrong side out, and those garments which are the most liable to fade, should be hung in the shade.

For black cotton, or those goods which are bound to fade any way, a little salt thrown in the water will help to keep the color in the fabric. I think one secret of success is this: not to let the garments remain in the suds, and not to rub soap on them. Colored cotton should be always ironed on the wrong side; but our blue morning gowns, red table-cloths, and a few other things will look almost as well, and certainly do their duty as well, if they never feel the hot breath from a sad-iron, and the time that we would spend over the ironing-board, can be profitably spent making the acquaintance of the last new magazines and papers, or practicing our neglected music. Oh! farmers' wives! let us trust in the good time coming, when we shall have co-operative laundries and creameries; then the wife and mother will not lose all of her attractive charms by unremitting drudgery and toil.

FROM MRS. E. D. CORY.

My method of washing colored cotton goods is to wash them through the suds after the white clothes have been rubbed through and put over to boil. They are then laid aside for a little while, until the white clothes are sudsed and rinsed, when they are again rubbed, if necessary, through the suds water, rinsed, starched in good flour starch, turned wrong side out, and immediately hung up to dry. I prefer a shady, but airy place for drying colored cotton goods. I think that to allow the fabrics to remain wet a long time is injurious to most colors, consequently I never hang colored clothes out in freezing weather; but dry them around the fire. I think that if black calico or goods of particularly delicate colors are washed in starch water without any soap, they will retain their colors much longer. The starch water is made simply by making enough flour starch so that, after diluting it with water, there will be sufficient in which to rub the garment, afterward rinsing it in weak starch water. If a small quantity of salt be added to the starch when cooking, it will help to set the color and prevent sticking when ironed. When thoroughly dampened, I iron the goods on the right side with a medium-hot flat, as I do not like the rough, wrinkled looks of clothes ironed on the wrong side.

FROM F. A. BROWN.

I have hired my washing done for a number of years, and have yet to find a laundress who can wash a colored cotton dress without spoiling it, so that long ago I reduced the children's dresses to plain ginghams which I *know* will not fade. I have been successful in washing delicate colors, in this way:—

I have three tubs ready with water just pleasantly warm, and boil a little soap beforehand, which I use in the first two waters just enough to make the water *soft*. I wash the garments quickly and rinse in cold water and hang them out at once. I have never found any benefit from the use of salt water to set the colors. I iron all colored clothes on the *wrong* side; for I know positively that a hot iron used on the *right* side will fade the colors more than poor washing. If the garment must have a gloss, one can use a much cooler iron for the purpose after first ironing on the wrong side. I do not like starched clothes, and unless the colors are very light, the goods, in my opinion, look much better without starch.

The "guid"mon" thinks no one can wash his flannels like "the wife." I put them into water as hot as I can bear my hands in and "sudsy," the last water being clear with a little bluing in it, and hotter, if anything, than the first. I wash out one piece at a time, shake thoroughly and hang out, getting it dry as quickly as possible and pressing on the wrong side with a cool iron. Washed in this way, the flannel is soft and woolly, and never shrinks.

FROM JULIA S. INGERSOLL.

My custom has been this: for dark cambric and percales I take warm soft water, and for two pails dissolve one-half tea-cupful of salt. I make moderately strong suds with good hard soap, and for the most soiled places apply the soap a little at a time, and immediately rub, or the color is apt to come out if the soap is left on many minutes. Wash one piece at a time, and immerse in rinsing water with salt added. Wring out and starch immediately with Kingsford's or any other brand of starch, on the wrong side, and dry quickly in an airy place, in the shade if possible. Iron on the wrong side and the goods will look almost like new. I sprinkle overnight or at least three hours before ironing, that the dampness may be evenly distributed. I have had very dainty medium blue French print that I washed in bran water with good results. I take one quart of bran (wheat), tie it in a salt-bag, quite loosely, or with room in the bag for twice the amount of bran. Soak in a pail of warm water for an hour or two, put bag and bran water into a tub of two pails of warm water, and wash the goods without soap, unless they are badly soiled. Rinse in clean water with some of the reserved bran water added. Dry in the shade, and iron on the wrong side, or spread a thin cloth over the waist and those places which will not iron smoothly on the wrong side, to prevent that shiny look which is caused by the starch and hot irons. Dark prints must be washed and rinsed in water which has not been used for white clothes, as the lint from the white garments is sure to show on dark cotton; for light ones it will do no harm. For ordinary fast ginghams and prints I use hard soap and clean water for washing and rinsing, and starch with flour or fine starch, according to the quality of the garments. Sprinkle and fold over-night or three hours before ironing. Iron on the right side, if the colors are quite light. The bran water doesn't seem to fade the colors, for whenever I have tried it they come out bright and fresh, and one would hardly think they had been washed.

FROM GERALDINE GERMANE.

In washing colored lawns, ginghams and calicoes I do not put them into hot water, or in strong suds, neither do I rub soap on them, nor leave them in the tub to soak. I use water just comfortably warm to the hands, in which enough hard soap has been dissolved to make weak suds. Rub through this quickly, wring and throw into a generous quantity of clear, cold water, turn wrong side out, rinse, dip into starch that has been cooked and has cooled, wring out and immediately hang in the shade to dry. Remove the garments from the line as soon as they are thoroughly dry, sprinkle with cold water and roll tightly two or three hours before ironing. Use moderately heated irons, and iron on the wrong side when possible. Plain brown lawns and calicoes will keep their color better if two or three table-spoonfuls of cold coffee are added to the starch.

Black cotton goods and goods that fade should never be washed with soap, but in lukewarm water in which a table-spoonful of salt and a tea-spoonful of soda have been dissolved to each quart. If there are badly soiled spots they should be cleansed by rubbing in beef's gall or the yelks of eggs. Such goods should be immediately rinsed in clear, cold water, wrung as dry as possible and starched in cool starch that is free from lumps, and if a little black dye be added, the color of black goods will be better and longer preserved.

FROM MRS. A. J. GREENE.

If my white clothes are out of their scalding water, I like to use that for rubbing my colored cotton garments. If not, I take clean *quite* warm water and make good suds, being sure that the soap is dissolved. Then I put the finest, lightest-colored articles into the water and rub them out as quickly as possible, putting each into very warm water for rinsing, adding a small handful of salt. Thoroughly rinse, wring out, turning them wrong side out, starch and hang on the line where they will dry as quickly as possible. I use flour starch, except for muslins, cambrics and like goods. For them I use lump starch cooked, and am governed by the texture of the goods as regards its thickness. Then, taking the next lighter-colored goods I proceed as before until all are rubbed and on the line wrong side out.

For dark blue, or other dark goods making the starch very blue prevents it from showing when the goods are ironed. As soon as they are dry, they are brought into the house, sprinkled at night and rolled, unless I am suspicious that the colors will run; such are left until morning. All articles except plain dark goods I iron on the right side with a pretty hot iron.

FROM MRS. ALICE P. SHEFFER.

Before putting colored clothes into water, it is best to look them carefully over, and if there are any grease spots, they should be washed out first, as they cannot be seen after the articles are wet. Do not wash in very hot water. Warm water does as good work and is not as trying on colors; that is, it will not extract the color so much. Rub immediately, not allowing them to soak long. Soft soap should never be used for any colored clothes except for the various shades of yellow calicoes, for which it is preferred. Rinse such garments always in soft water; while for the other colors hard water is preferable, and rinse them out as soon as they are washed; hang in the shade. A little salt in the rinsing water serves to brighten and set the colors of black, green, and blue calicoes. Alum dissolved in the rinsing water is excellent for green colors, while vinegar added to the rinse will brighten red and pink cottons as if they were new.

For several days before the general wash-day, save up the water in which potatoes have been boiled, and use this for black calicoes, dark lawns, and linen. It can be heated to the right temperature, using no soap. The goods will need no other starching, as the potato water will stiffen them, and also preserve the color. Never starch black cotton with wheat flour. Another method much used by my grandmother for garments inclined to fade, was to wash them in lukewarm water, adding a beef's gall in the proportions of one-half pint to three or four gallons of water, rinsing in hard water. Do not use soap unless absolutely necessary. Most women make flour starch by mixing up the flour with water until the mixture is free from lumps, and then pouring boiling water over it, until it is of the proper consistence. I think a better way is to pour the prepared flour-water free from lumps, slowly into a pot of boiling water, stirring it until it has cooked four or five minutes. Strain it through a bag made of two thicknesses of dairy cloth and then thin it with cold water. If the starch is made in this way the clothes will have a better look. Do not iron calicoes with irons too hot, as the hot irons will change the colors very materially, especially those that are red. Garments that have been starched, should not be put away for several weeks or months where the air cannot circulate freely, as starch has a tendency to make the fiber tender when the goods are not exposed to air.

FROM M. E. S.

For the farmer's wife, I think colored clothes the most troublesome part of the washing. New colored cottons I usually put into a tub of clean, warm water in which I have dissolved a handful of salt. After they have soaked five or 10 minutes, they are washed clean with some good hard soap. I prefer Ivory. They are rinsed well, wrung dry and hung in the shade if possible. If one has not a shady place, she should be sure that the wrong side is the one exposed to the sun. For starching dark cottons, weak gum-arabic or glue-water gives the desired stiffness without the troublesome white specks flour starch sometimes leaves. A tea-spoonful of borax in the starch will prevent it from sticking to the irons.

Sprinkle the goods an hour or so before

ironing them, and iron on the wrong side with a moderately warm iron. I find the results more satisfactory if the garments are not allowed to become very much soiled before washing, for the first time at least. Unless the goods are of some delicate color, I do not use salt after the first washing.

FROM MRS. MARTHA A. S. WEBSTER.

My plan has been to put four or five heaping table-spoonfuls of wheat flour into a milk pan, add about half a pint of cold water and stir until it is perfectly smooth, then fill the pan with boiling water from the tea-kettle, stirring briskly all the time. Remove one of the grates from the oven to the top of the stove, and on this place the pan of starch, to boil from three to five minutes. If it is thoroughly boiled, no tallow or spermaceti will be needed to prevent sticking. Add half of the starch to two or three pailfuls of lukewarm or nearly cold soft water, stirring well. Then rub the goods gently on the board, wetting but one piece at a time. Use no soap unless the goods are very much soiled. When rubbed clean, drop each article—after shaking it—into another tub into which has been stirred the remainder of the starch and two or three pailfuls of hard water. Turn the garments wrong side out and rinse them thoroughly. Wring by hand, and, if possible, hang in a shady place to dry.

If the starch is the least bit lumpy, strain it through an old thin towel or a piece of cheese cloth. This amount of starch will cleanse two dresses for a woman, or several smaller garments. Washed in this way, black-and-white ginghams and prints will remain as bright as new until they are nearly worn out. Iron on the wrong side. Where linings cause wrinkles, lay a piece of thin cloth on the right side of the waist and sleeves of a dress, and iron on that, if a "shiny" appearance is not desired.

FROM M. G. D.

Always use soft water. Have the water as hot as the hands can bear, but not boiling. Put the soap in the water, not on the clothes, unless they are very much soiled, and then not until after they are wet. Wash the clothes in two waters, then rinse them thoroughly in soft water and hang them in the shade and air to dry. If they are to be starched, make the starch by dissolving it in a little cold water and then pouring boiling water on it until it becomes clear, stirring all the time. Dip the clothes in the starch after they have been rinsed, and wring moderately dry. If they are not stiff enough, they can be dipped again in the starch after they are dry, and again hung out to dry. Always turn colored clothes wrong side out to dry. If the clothes are black-and-white, and the colors are inclined to run together, put a little salt in the last rinsing water or starch—about one teaspoonful to a gallon of water. For light goods put a little indigo in the last rinsing water. Sprinkle the clothes the night before they are to be ironed, and iron until dry, taking care not to scorch them. If they are ironed on the wrong side they will not show those shiny streaks along the seams, that they do when ironed on the right side.

FROM E. D. B.

In washing colored clothes, use clean warm water, made a little sudsy by the use of any kind of good hard soap. I use home-made soap. Never put more than one piece in the water at a time. Wash out quickly, rubbing the soiled spots by hand. Use a very little soap if you are sure it will not spot the goods. I prefer a slight stain rather than have the color taken out by the use of soap. Rinse in clear water and starch. Dissolve the starch in a little cold water, then slowly stir in boiling water till it is clear and about the consistency of sweet cream; add a pinch of salt; it will make the goods clear and keep the starch from sticking. Starch the clothes on the wrong side and hang them in the shade, wrong side out. Take them in as soon as dry. Black and dark calico, or anything the color of which will I think run together. I rinse in a pail of water in which a good handful of salt has been dissolved. Wash indigo-blue calico in good suds; if much soiled, it will bear quite hard rubbing. Rinse well, turn wrong side out, and dry in the shade without starching. I think it looks more like new calico without the latter. Sprinkle your clothes at night, make them quite wet and roll up tightly. Be sure they are thoroughly dry before sprinkling and they will iron nicely in the morning. Indigo-blue, black, and all dark colored cotton goods, should be ironed on the wrong side. Very light-colored goods I prefer ironed on the right side, as I like to have them look slightly glossy.

FROM MARY D. THOMAS.

When I have to wash a garment that I am anxious to look well, I wash it as quickly as possible, and do not use water that is too hot. I always use hard soap to make suds but do not rub it upon the goods. I use boiled flour starch in the water; one can use her judgment as to the quantity. After rubbing the goods through this water, they are rinsed directly in cold water, and then starched slightly, for they still retain a portion of the starch that was put in the first water. The more quickly they are washed and dried, the better they look. I seldom hang them out in the sun, but generally dry them near the range. If hung out, they should be turned. After they have been sprinkled and when they have stood long enough to be dampened evenly, they are ironed on the wrong side, where it is possible, and with not too hot an iron. This way of washing colored goods has proven satisfactory with me.

FROM MRS. W. W. H.

For washing colored clothes, I always use clean water not very hot—never boiling—or rinsing suds—and hard soap of my own make, which contains some borax. I do not soak them by putting several articles into the tub at once, but take the lightest-colored first, wash, rinse, immediately starch and dry as soon as possible. I do not put them where they will freeze in winter, or leave them out all day in the wind and sun in summer. If the ground-work of prints is white, I use store starch with a little bluing; if not, flour starch made in this way: Two small table-spoonfuls of flour for a dress and three or four aprons. I do not like them too stiff. Stir in a little cold water. I do not stop to mash all the lumps as I was taught to do when a child, but pour on boiling water and strain through a tin strainer, which takes out all the lumps. I thin it with cold water, adding a little before putting in each article. If the prints have green in them, put a little alum in the rinsing water; if black or brown, use a handful of salt to a pail of water, letting them stand a few minutes. Sprinkle the clothes well, letting them lie an hour or two rolled up in a towel; then iron with a moderately hot iron, until they are quite dry. If the iron is too hot, it fades them worse than the washing. I never use a *hot* iron for colored table-cloths or napkins.

FROM MRS. H. M. R.

My method of washing and ironing colored cottons is very simple yet satisfactory. If washing day is unfavorable for drying clothes quickly, the best prints are laid out of the wash; otherwise they are washed in warm bluing water with hard soap, the lighter colored ones first, each piece being put in the water only when I am ready to wash it. The rinsing waters are cold, the last one blued for all colors except pink. The thin boiled starch (not blued) is prepared in the same way as that for the white clothes, and allowed to cool. Each piece as soon as washed is well rinsed, starched wrong side out, and hung in the shade right side out to dry. On ironing day—a clear one is preferred—the prints receive a fine sprinkle, are rolled tightly, and as soon as evenly dampened they are ironed on the wrong side with a light pressure and again on the right. I have never used anything that would successfully set color on fading goods. My way is not to buy them.

FROM MRS. L. F.

I think the two most essential things in washing colored clothes are plenty of warm water and dispatch. My mode is to place the lightest-colored things, lawns, percales, ginghams, or whatever they may be—in the machine first. These are rubbed through quickly, wrung out and put through warm suds that contain no soap, then rinsed through starched water which is slightly blued, if necessary, for any of the goods. Hang out immediately and follow with the next darker colored lot. A tea-spoonful of beef's gall in the rinse-water will prevent fading. Salt is good and so is soda. I use flour starch, as I think the clothes iron nicer. It is made thus: two or three table-spoonfuls of flour moistened and worked smooth, pour on boiling water, stirring constantly until clear and thick; then thin so it will strain through a piece of cheese cloth. If all parts of colored clothes that can be ironed on the wrong side, are so treated they will look as nice as new.

FROM MRS. M. S.

My way is to make suds, not very strong, and add borax, the amount required depending on the condition of the goods to be washed. I wash them through only one water and do that as quickly as possible; for the longer the goods remain in the suds the more the colors will run together. I rinse them until the water is clear; then hang them in the shade to dry. If they are ironed when taken from the line and before they are thoroughly dry, I find they will look well for a long time. Slightly soiled garments and those that faded badly I have washed in bran water. Take a piece of cheese cloth and tie up a quantity of bran and squeeze it out in the water in which the goods are to be washed. If well rinsed and well pressed they will look like new. I have learned lately that if a red table-cloth is put in strong hot brine for an hour or two before putting it in suds for the first time it is washed, the color will last much longer.

FROM MRS. ESTELLA E. G. WALLIS.

The use of soda is fatal to cotton goods and nothing is more frequent than to see the delicate tints of lawns, etc., blotched and streaked by the ignorance and vandalism of a laundress. It is worth while for ladies to pay attention to this, and insist upon having their summer dresses washed according to the directions which they should be prepared to give their laundresses. In the first place, the water should be tepid, the hard soap should not be allowed to touch the fabric; it should be washed and rinsed quickly and turned upon the wrong side as soon as possible. Linen should be washed in water in which hay or a quart bag of bran has been boiled. The latter will be found to answer for starch as well, and is excellent for pink dresses of all kinds; but a handful of salt is very useful also to set the colors of light cambrics and dotted lawns, and a little ox-gall will not only set but brighten yellow and purple tints, and has a good effect upon green. Alum, also, is good to use in the starch for muslins, ginghams and calicoes. Dissolve a piece of alum the size of a walnut for every pint of starch, and add to it. By so doing the colors will keep bright for a long time, which is very desirable when dresses must be often washed, and the cost is but a trifle.

FROM A FARMER'S WIFE.

I do my washing with as little elbow grease as possible. I use Frank Siddall's soap for my white clothes and wash the colored ones in the same water. I don't think it fades them and if it makes them tender we can have some new ones all the sooner. Rinsing well and starching in flour starch with a little piece of butter melted in it, and ironing, is treatment good enough for the five-cent remnants we farmers' wives have to wear. I shall make soft soap soon, and I think that just as good as hard. What's the use of wearing ourselves out washing, anyway, when all we get is our board and perhaps as much pin-money as the head of the house spends for tobacco? I want to save my strength so as to live long enough to get the use of that third of the property, half of which I have earned.

FROM LAURA E. RICE.

I wash in warm water with as little soap on the clothes as possible, and there is no very hard rubbing on the board. If the clothes are much soiled I use two waters for washing them. After rinsing them in warm water, I have ready some clear cold water with some salt in it—about a table-spoonful to a pail of water. I let the clothes remain in this for a few minutes. For those that I wish starched I make a thin starch—I use *starchine*, which requires no cooking, as the hot water poured upon it is sufficient. After starching, I hang them where they will dry quickly, without the sun shining directly upon them; being careful to hang so as to have as few wrinkles in them as possible. When they are dry, I dampen, fold and roll them up carefully and lay them aside for an hour or perhaps longer. I iron with a hot iron, being sure to dry them with the iron.

FROM AMANDA C. ERHART.

Colored cotton fabrics should be washed quickly in a good suds either quite warm or hot, according as the hands or machine are used. Rinse well at once and starch and dry in haste. Do not expose to a hot sun in summer, or to hard freezing cold in winter. If it is desired to maintain the colors, iron on the right side which gives a gloss which is a preventive against soiling so quickly. Dainty fabrics, such as lawns, can be washed nicely in starch-water leaving out soap altogether. Use two starch waters if the goods are much soiled.

FROM ALICE JOHNSON.

Dip them first in a solution of salt and water, and hang them in a shady place to dry—the salt sets the colors. When dry wash in light soap suds in the usual way. Calico and muslins do not require hot suds. Water moderately warm is best. Wash quickly, turn wrong side out and hang in the shade. For blue goods, blue the rinsing water, also the starch.

Another way is to make a paste of bran, as one would make starch, and boil it one hour, then strain it into warm, soft water. No soap is necessary, as bran has cleansing properties of its own. Always iron on the wrong side with a moderately hot iron. Sugar-of-lead and other drugs may be used to set colors permanently, but this is not desirable, as they are poisonous, and make the goods tender.

FROM JULIA OSBORNE.

To wash colored cotton goods without causing them to fade is almost impossible, but fading may be prevented in a measure by proper care. First, the water should be only moderately hot. I generally use the rinsing water of the white goods. Should it not be hot enough I add more hot water. But this water could not be used for black goods on account of the lint from the white goods remaining in the water. Then wash out the light calico garments first, not putting too many in the water at once, as the longer they soak in the water the more liable is the color to come out. After the light goods are finished, put in the dark ones, and all should be rinsed in two clean waters. They are then ready for the starch which I think is best not too thick, and it should not be used very hot. In ironing after the goods have been sprinkled and laid away for an hour or two (overnight is better), the dark ones will look much brighter if ironed on the wrong side. No washing soda or other washing preparations should be allowed to come in contact with colored cotton goods if keeping them fresh looking is desired.

FROM ETTA D. LYON.

I use hard or soft water and good hard soap, never soft or inferior soap. Make moderately warm suds, put in the goods, the light-colored and least soiled first; soak five minutes; then wash out quickly and thoroughly. Some goods will not bear rubbing on a board and such may be washed with the hands only and rubbed as little as possible. When all are through the first suds, make another, using less soap than for the first, and wash them through this. Then rinse in cold water, and starch in boiled starch of the consistency of thin cream (if made of flour it should be strained) and hang wrong side out, in the shade to dry. Remove from the line as soon as dry and dampen and fold for ironing. I let them lie over-night so that the moisture may penetrate every part. I use moderately hot sad-irons—too much heat will permanently injure the color of some fabrics. Colored cotton and linen table-cloths or napkins I never iron; I fold them smoothly while damp and put them under a weight and they retain their bright colors much longer than if ironed.

FROM JESSIE LAWRENCE.

I always use plenty of water and good hard soap. Have the water lukewarm and soap the things in it, roll them up, and let them soak 30 minutes or longer. Then wash quickly through two waters and rinse in blue water, then turn them inside out, starch, and hang them out. Bring them in as soon as dry, as exposure to the sun and air fades cotton goods more than washing. Sprinkle with warm water; and roll them up tightly. In about two hours they may be ironed, but they will iron better if left longer. We like to dampen them at night and iron them the next morning. Never use a very hot iron, as it takes the color out and makes the clothes tender. Our cotton goods, washed and ironed in this way, keep bright until worn out.

FROM MRS. T. S.

In washing colored cottons I heat sufficient water, with soap cut fine, to make good suds so as to avoid rubbing the soap directly on the goods. I wash them through two waters as quickly as possible and rinse them well. I think much depends on the way clothes are rinsed. In washing prints the first time, I soak them for a few moments in lukewarm water to which a spoonful of salt has been

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria

added. If the goods are green, I use alum; and if red, sugar-of-lead to set the colors. In washing very fine prints and lawns that are known to fade with soap, I make a starch the same as for starching, and put it in the water, using no soap. I wash through two waters and rinse well. I use good starch well boiled. To a quart I use a piece of spermaceti the size of a common marble; or a spoonful of coal-oil will answer very well, and rub the starch well into the goods. I dampen my clothes with warm water about two hours previous to ironing. Iron until perfectly dry.

FROM MRS. A. A. RICE.

I observe five principles in the cleansing of colored cotton goods to prevent fading and preserve a clear and bright appearance, viz.: 1. I use *warm* water—not hot—both for washing and rinsing. 2. I wash with the best soap (generally the Ivory), making good suds and I do not rub soap on the goods. 3. In the last rinse water for the washing of new goods for the first few times I put fine salt in the proportion of a good cupful to two pails of water, and let the goods stand in it half an hour. With *black calicoes*, stockings, etc., I reverse the order and let the goods stand in warm salt water before washing. 4. There is less fading when the goods are dried in the shade; an open shed is excellent for air without sun. 5. The ironing should be done on the wrong side of the goods, with irons not too hot.

FROM MRS. M. S. DRUM.

My method of washing and ironing colored cotton goods is as follows: I take soft water as warm as the hands can bear; shave up some white soap, add a little water and set it on the stove. When the soap is dissolved I add the suds to the water in the tub, making it quite soapy. I prefer the Ivory soap. I know from many years' experience that it will not fade or injure the most delicate color. Rub the clothes through this water; if they are much soiled rub through another water. Then I rinse them thoroughly in plenty of cold water, adding a little bluing, and a small quantity of common salt, which brightens the colors, giving them a fresh look. Wring them dry, using a good clothes-wringer, starch, hang up immediately, and do not allow them to freeze in cold weather. As soon as they are dry, dampen, roll up tightly, let stand a few hours, then iron. If you wish them extra nice, iron on the wrong side.

FROM MARY J. LYON.

Wash the goods as quickly as possible in warm soap-suds made with hard soap; rinse them in cold water, starch, wring quickly, and hang out to dry, not in the sun, but where the wind will dry them quickly. Iron on the wrong side as soon as dry enough. It is best not to sprinkle. If I suspect that the goods will fade, I use a table-spoonful of ox-gall to a sufficient quantity of hot water for washing one dress; let that article remain in this a few minutes, then when cool enough wash as usual. Or dissolve half an ounce of alum in sufficient water to rinse two dresses; when every part is wet, wring out and wash as usual.

FROM EMILY A. PITT.

After having washed the fine white goods, I wash colored cotton goods in the cool suds, especially if there is danger of their fading—and rinse them in clean water. If there are dark blues and browns, I wash them in *clean* suds. I use hard soap for all. Then I wet my starch (I use Silver Gloss usually) with a small quantity of cold, soft water. Add a lump of borax the size of a walnut for two table-spoonfuls of starch, and a tea-spoonful of kerosene oil. Let it boil five minutes. Wring the goods out of the rinse water, and put them in the starch. (I use bluing for only very light goods.) Wring dry and hang out as soon as possible. When dry, take from the line. Dampen at night and iron early in the morning. For very dark prints I use very thin starch, as I do not think a very stiff kind improves a garment.

FROM MATTIE F. BROWNING.

I think it very important to have water and starch not too hot, and to wash, rinse and dry the goods as quickly as possible. One should not rub soap on them, but make some suds to wash them in. Do not use very hot irons. Any colored cotton goods which I know are likely to fade, I soak in a solution of salt and water (say, a handful of salt to a gallon of water) before washing. Though this will not always entirely prevent fading, I have found it to help very much.

FROM MRS. S. C. T.

I find it more difficult to wash some colored cottons, particularly calicoes, than ginghams, without causing them to fade. I never want clean water for washing them in *first*, as clean water, with fresh soap in it is quite apt to fade the dark shades of prints, and will sometimes spot the goods, should the soap not be dissolved. After washing my white clothes, I put my dark cotton goods through the same water without adding any more soap to it.

As I always put my white clothes through two waters before scalding, I serve my colored cottons in the same way. I use some of my scalding water, adding cold water, to put them in for the last time before rinsing. Don't let them remain in this, only rinse them up and down to get the dirty suds out before rinsing them for the last time. Should they need any rubbing, do it in this water, and if you need any soap on extra soiled spots, use some good hard kind. I always want good bluing water for the last. A handful of fine salt added to the water is good, especially for black-and-white goods. Hang in the shade to dry, and if the colors are inclined to run, keep changing the position of the garments on the line, hanging them differently every time. It is best to starch them by turning them wrong side out. As to the ironing, most of the dark prints, blue and red in particular, will look better and more like new goods if ironed on the wrong side. They will iron better and easier if sprinkled and let stand over-night. Do not have the irons too hot, as that will sometimes change the color.

FROM E. W.

I have had excellent results from the following simple method: Before I wash cotton goods that I am not certain will hold their colors, I let them stand for about 30 minutes in a strong solution of salt water, which will set the colors. Wash out quickly in strained suds to remove any lumps of soap; and use no soap on the goods. Rinse well in clear water, and hang out where they will dry quickly yet be in the shade. Before they are thoroughly dry, bring them in, sprinkle them lightly, and roll them ready to be ironed next day. I also find it an advantage to put them after ironing, where it is rather dark and where they can be thoroughly dried.

FROM MRS. R. MORRILL.

My way of washing colored cotton goods to prevent fading, is so simple that it seems hardly worth explaining, but it will do for seersuckers, chambreys, some ginghams and the best prints. Make suds with soft water and hard soap, let the clothes remain in this just long enough to soak thoroughly, then rub lightly, without putting soap directly on the goods. Hard rubbing on the board destroys the color and the goods. I prefer a washing machine that will cleanse without the board. Then rinse well, turn, and if very choice, dry in the shade. Iron on the wrong side with a moderately warm iron, for if it be hot it will fade the goods as much as the washing.

FROM MRS. W. J. WALKER.

Into clean warm water in a tub I put one table-spoonful of pearline and one tea-spoonful of powdered borax to three pails of water. Wash the light-colored cottons first, rinse and starch, then the dark ones in the same water, adding a handful of salt in rinsing if the colors tend to fade. A little vinegar in the water that is used for rinsing pink, red, and green cotton, is good to brighten the colors and keeps them from mixing. As soon as washed, rinsed and starched, I turn them wrong side out, and hang in the shade. Iron on the wrong side, and they will look as good as new.

FROM FANNIE GREENE.

Calicoes, ginghams, etc., place in weak suds and rub out immediately. Rinse them through clear water, starch and hang them in a shady place. Lawns and other delicate fabrics rub gently (or squeeze with the hands) in water in which a little starch made from flour has been placed; rinse in a water prepared like the first and hang them up. I do not think this way is new to any one because it is quite old and the way mother has always washed. We iron calicoes and ginghams on the wrong side with a moderately hot iron.

FROM ADDIE B. PECK.

Put the goods into sufficient salt water to cover them, and let stand before washing. Then take plenty of warm (not hot) rain water and hard soap, make rather weak suds, put in the goods and without rubbing any soap on them, rub gently and quickly till all parts are clean. Then turn wrong side out, rinse, starch and dry as quickly as possible. When dry, sprinkle with warm water, roll up tightly and let remain a couple of hours, iron on the wrong side, till perfectly dry, and the goods will look almost if not quite as well as when new.

FROM ANNIE EVENDEN.

I am afraid my short experience of laundry work will be of little use to you, in comparison with that of older housekeepers, having only had four years experience in any kind of laundry work. I have, however, found that with colored cotton goods, if you wash them in quite cool water, and put one table-spoonful of salt to one gallon of water, the color does not come out *nearly* so much as it does with warmer water and no salt. As far as ironing them is concerned, I damp and iron as I do other clothes.

FROM LIZZIE JOHNSON.

I would first soak them for a few minutes in weak salt-and-water; take them from this to warm suds and rub them on the wrong side. Add a little salt to the first rinsing water, rinsing them in clear water the last time, and hang them to dry wrong side out. If no gloss is desired, iron on the wrong side.

FROM MRS. PATIENCE STILES.

Make some good suds with hard soap and warm soft water, put a few pieces in at a time. Wash the goods out quickly. Avoid rubbing soap on them as much as possible. Rinse in warm, soft water to remove any suds; then place in hard water. This sets the colors, or prevents them from running together. When all are washed, rinsed, and placed in hard water, wring out one piece at a time, starch, (if necessary), wring perfectly dry; then dry quickly. I find

DOMESTIC ECONOMY.

(*Continued from Page* 319.)

that colored cotton clothes, when washed in this way seldom fade.

FROM ANNA W. NEWKIRK.

To prevent the colors from running and to give the goods a bright, fresh look, I put in the water a cup of salt, the kind we get for the stock. In washing Jersey blankets, which I consider to be heavy cotton flannel, the red and blue stripes on the ends never run if salt is freely used in the first water.

FROM MRS. GEORGE LANG.

I take clear, soft, hot water and make some suds from hard soap (I use Babbitt's). If the goods are very dirty I use a little soap. After they are washed, I turn them, and put them in cold water to rinse. I then starch and hang them in the shade to dry. I iron them on the right side, but I am very careful not to have the iron too hot, as a very hot iron will fade the goods.

FROM M. CHAPMAN.

I put the goods into clear rain water, not quite as warm as dish water. I use hard soap and rub them out as quickly as possible, plunging them immediately into clean hard water directly from the well. This sets the color if inclined to fade. For drying I prefer a shady place. with a good breeze. I think the more quickly they can be washed and dried, the nicer and brighter they look. I generally use wheat flour for starch. After cooking, I strain and settle it. If there is any part white about the goods I use a little bluing. Iron them on the wrong side, using a moderately hot iron; hang in a draught until thoroughly dry, and hang away in a dark place.

FROM MRS. H. H.

I usually wash colored cotton goods in suds after white clothes. I wash with kerosene, being careful not to have the water very hot, using elbow grease instead of much soap. Wash, rinse and dry in the shade. I think the surest way is to get indigo-blues, Turkey reds and such colors that don't fade, and are new every time when washed.

FROM SARAH E. CHAMBERLIN.

I find the best way to wash colored cotton goods, is to make some suds of hard soap and soft water, wash the goods thoroughly in the suds, rinse in soft water and blue them in hard water. Starch in a very thin boiled starch (not flour) and hang in a shady place to dry. Sprinkle until they are quite damp and iron on the right side.

FROM MRS. ALLIE DILLARD.

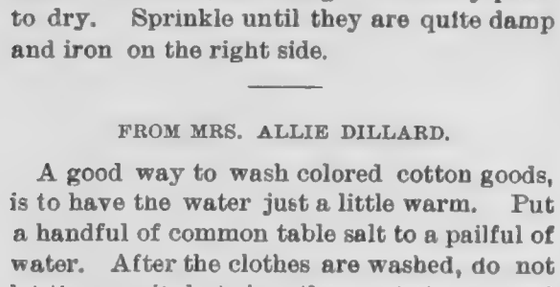
A good way to wash colored cotton goods, is to have the water just a little warm. Put a handful of common table salt to a pailful of water. After the clothes are washed, do not let them wait, but rinse them out at once, and in winter dry them in the house, as freezing will cause them to look dull.

FROM MRS. S. A.

My way of washing colored cotton goods is very simple. I use only clean water and Ivory soap: rinse and hang out immediately, not allowing them to stand in the water. If to be starched, use thin starch.

FROM JENNIE W. GRAHAM.

I have heard of an old lady who has always had very good success in this line, and she says that she washes her calicoes in the dirtiest water she has, and then rinses them *thoroughly* in clean water.



PATIENCE is bitter but its fruit is sweet. It will require but little patience ere you begin to taste the sweet fruit, if you use

Warner's Log Cabin ROSE CREAM,

News of the Week.

HOME NEWS.

SATURDAY, May, 4 1889.

THE CENTENNIAL CYCLONE lasted the first three days of the week here. The celebration began on Monday on the arrival of President Harrison in New York after he had been previously received with great enthusiasm at Elizabeth N. J., and at other points along the route from Washington. He was accompanied by the members of his Cabinet, except Secretary of State Blaine whom illness detained at Washington. The naval parade in the bay and partly up the East and North Rivers was a magnificent spectacle, unprecedented in this hemisphire, and hardly ever equaled anywhere else on the globe. The reverberating boom of heavy guns from the war ships and forts, the shrill or deep whistles from multitudinous steamers, the cheers and huzzahs, on all sides, the long lines of gaily beflagged vessels, the innumerable small boats, from trim yachts to clumsy row-boats, the glistening waters and laughing skies made a *tout ensemble* hard to be imagined and never to be forgotten. A crew of jolly old sea-captains rowed the President from the reviewing vessel to the foot of Wall street where Washington had landed one hundred years before. Here he was welcomed by Governor Hill of New York State, Mayor Grant of New York City and other celebrities. He was then escorted to the Equitable Building on lower Broadway where he partook of a banquet and held a reception. Then he proceeded to the City Hall where he was welcomed by rows of white-clad school girls, and held another reception. The evening and night witnessed a grand ball, reception and supper at the Metropolitan Opera House ..... The chief feature of the next day—Tuesday—was the grand military parade, when over 50,000 troops, representing every arm of the service and nearly every State in the Union, marched from the Battery at the lower end of Broadway for eight miles up the City, through the chief streets, lined with people-covered stands, and thronged windows, balconies, door-steps and roofs. At Madison Square, about the middle of the line of march, they were reviewed by the President and other notabilities The gay dresses of the men, their rythmical step, glittering arms, fluttering flags and resplendent banners; the inspiring bursts of music at the head of each body; the wild cheers from the enthusiastic spectators lining both sides of the road from the pavement to the roof pitch—all made a glorious show, marvelously commemorating, even by force of contrast the modester scenes at Washington's inauguration a century before, in a town insignificant in size and population as compared with the city of today. The parade took six hours passing a given point. A grand banquet at night gave opportunities for eloquent speeches by President Harrison, Governor Hill, General Sherman, Governor Lee of Virginia, Ex-President Cleveland, Senator Daniel, Chief Justice Fuller, Ex-President Haves, Senator Evarts, James Russell Lowell, and other distinguished men ..... The principal attraction of the third day—Wednesday—was the industrial parade, which numbered about 80,000, and would have numbered 125,000 were it not that it was cut down, as the larger one couldn't have been seen in a single day. It took nearly 11 hours for the 80,000 line to pass a given point. All the industrial, temperance, political, social, and other civic organizations were represented. The width of the street measured the width of the line abreast. A multitude of gaily bedizzened "floats" drawn by finely caparisoned horses, bore a vast variety of scenes, industrial, allegorical, historical and humorous. Although unlike Tuesday, Wednesday was neither a State nor National holiday, the crowds in the streets were, if possible, larger, as every workingman with all his family took part in the festivity. The procession was reviewed by the President and other prominent personages for six hours at Madison Square. Never before was such an outpouring of the industrial classes witnessed on this side of the water or probably on the other..... ..... During the whole celebration the vast crowds in the streets and the enormous number of flags fluttering everywhere and other decorations hiding most of the house fronts, were the most noticeable features. Close estimates place the arrivals at 468,000 each day, and it is estimated that 1,150,000 non-residents of New York were here at one time. Most of these came from the surrounding country within a radius of, say, 50 miles, and the great majority returned home every night. There was no difficulty in lodging and feeding the visitors, and prices everywhere were about the same as usual. The visiting troops for the most part encamped in the numerous armories and other large buildings where they were supplied with mattresses, blankets and rations, though many of them found less warlike quarters in hotels and private houses. Governors of States and other political and military notabilities were as thick as colonels in Kentucky. Vast quantities of wines and liquors were swallowed; but beer was the principal beverage, and oceans of that disappeared; still there was very little vociferous or turbulent intoxication. Public and private banquets, dances and "parties" of all kinds made every night hilarious. The theatres were not over-crowded, as the vast bulk of visitors thronged the streets at night, while most of the "old-timers" were either out sight-seeing or attending public or private festivities. Every night also there were grand displays of fire-works, some of them at public expense, others given by political and other associations, while many private parties spent not a little on such manifestations of joy, and of course, the "small boy" had to be gratified with noise and gun-powder smoke. All known pick-pockets and crooks of all kinds, residents or visitors, were at once locked up wherever seen, and remained under lock and key till Thursday, when all were discharged, so that there was really comparatively little robbery, thieving or other punishable dishonesty. Horses were in such demand that the hire of one would almost buy him in ordinary times. Altogether it was a glorious celebration of a memorable event, and a grand inauguration of the second century of our American form of Republican Government.. Tuesday, April 30, the actual centennary of the inauguration of Washington as first President of the Republic, was proclaimed a National Holiday throughout the United States by President Harrison, but to make it a legal holiday in any State the Governor had to proclaim it such. In most of the States this was done. In this State the legislature hastily passed and the Governor signed a bill making Monday and Wednesday also legal holidays so far as concerned this city and Brooklyn. This was important to prevent or mitigate business complications much more than for the sake of giving a merry-making season to the people. Tuesday was widely celebrated throughout the country by parades and other gala displays during the day, and by fire-works, dancing, feasting and speech-making at night. Americans abroad also duly "celebrated." .. .. At 9 A. M. Sunday last the St. Louis Express train on the Grand Trunk Railroad near Hamilton, Canada, in running at a high rate of speed round a sharp curve, jumped the track; the engine plunged into a water tank, two cars telescoped and, being heated with stoves, at once caught fire and 21 people were cremated, and a great many more of the 150 passengers were more or less severely injured. At the outset only two of the dead could be identified, but since then the charred fragments of three others have been recognized by pieces of clothing or jewelry, etc., on or near their remains. The train consisted of 10 cars and contained chiefly Western people on their way to see the Centennial Celebration in New York City.....

The Grave and the Gay.

The grave usually predominates in human affairs.

Disease and affliction make the *gay* but a transient visitor. Still the proportion may be reversed; the grave may be expelled; the *gay* invited and retained.

"How?" you ask incredulously. Well, there is a decidedly obvious inference in the following extracts, which answers these questions exactly.

GLASCOW, KY.

"I regard Compound Oxygen as a wonderful remedy, and shall ever be grateful to you for it." JAS. B. MARTIN.

PENSACOLA, FLA, July 25, 1888.

"I suffered from a very severe and obstinate case of bronchitis; I had tried a great many doctors' remedies, and, while not entirely well, I am very greatly improved, and feel fully assured that the same is due to your Compound Oxygen Treatment."

JOHN W. FRATER.

SUMTER, S. C.

"I have used the Compound Oxygen Home Treatment from Drs. Starkey & Palen as a revitalizer and have expereinced marked benefit from it." MRS. N. G. OSTEEN.
Proprietor *Watchman and Southern.*

NAPOLEON, O., Feb. 19, 1888.

"My entire family are using the Compound Oxygen more or less, and I consider it to be a wonderful remedy for all chronic troubles." MRS. L. L. ORWIG.

We publish a brochure of 200 pages, regarding the effects of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 120 Sutter Street, San Francisco, Cal.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, May 4, 1889.

Several important auction sales of horses and cattle will be held at the American Institute building, this city during the month. May 8 and 9, the Palo Alto Stud sale. May 14 and 15, Holstein-Friesian cattle, Combination sale, comprising a large number of animals from several noted herds. May 16, annual sale of ponies and donkeys. May 21, Oakland's herd of Jersey cattle. May 22 a herd of Jersey cattle. May 28 and 29, sale of carriage horses..... Jersey breeders will meet Tuesday, May 7, at Hardman Hall, corner Nineteenth street and Fifth avenue, New York City, beginning at 11 o'clock a. m. This assemblage is called by the American Jersey Cattle Club and immediately precedes the 1889 session of the Club, which will be held at the Fifth Avenue Hotel, at 11 a. m., Wednesday, May 8.....The most costly stable in the world is being built by J. B. Crouse, a resident of Syracuse, N. Y., and when completed is to cost $200,000.....The largest horse farm in the world is said to be 13 miles from Cheyenne, Wyo. It includes 120,000 acres, requires 100 miles of wire fencing to keep the animals in bounds, with 65 men to look after them. The horses, young and old, number 5,000.....Over 1,000 trotting-bred horses have been sold at Lexington, Ky., during the last three months..... ....Dehorning cattle has been declared illegal in England. A Norfolk farmer was summoned before the local justices for cruelty to cattle by dehorning them, but he was acquitted. An appeal was taken to the Court of Queen's Bench, London, and on Tuesday the Lord Chief Justice intimated he would reverse the decision of the justices, and would deliver a written judgment on the case on the first day of next term. ..... California is drying and evaporating her fruits to a much greater extent since the inter-State commerce law raised the rates to distant markets.....Florida is now the most formidable rival of all the other Southern States as an early shipper of fruits, getting into every market East and West before any other State by several weeks.....The first boat of the season through the Erie canal reached Albany, May 2.....The Orange County Stock Farm in the town of Warwick, formerly occupied by C. P. Huntington as a country seat, and later by several different owners, has been sold to Messrs. Drake & Stratton of this city, who, it is understood, will devote it to breeding fine horses and cattle.. The Maryland State Temperance Alliance in its session at Baltimore adopted a resolution asking the legislature to enact such laws as will bring cider within the category of strong drinks.....The pacer Bonesetter dropped dead at Baltimore, May 1. He was valued at $2,500.....Friday, May 3, was observed as Arbor Day in this State..... From Connecticut comes the report of the sale of a 400-acre farm of fair land, with spacious barns, good dwelling house and considerable wood for $1,000 ..... The maple sugar season in New Hampshire is stated to have averaged about as usual as to quantity, but with quality better than usual.....The Williams & Clark Fertilizer Company have removed their offices to the Market and Fulton National Bank Building, Rooms 51 and 52, 81 Fulton Street, New York..... Michigan is to have a permanent location for the State Fair.....

Literary.

OUR FIRST FARMERS' INSTITUTE.

BY WM. ROSS.

CHAPTER IV.

THE committees had a week to prepare reports to make at the next meeting. The chairman of the Program Committee had to do all the work himself. The other members had to be caught "on the fly" if caught at all. He made up a program, fixing the hours of meeting, the hours of adjournment, the hours when the State speakers would be heard, an impressive opening ceremony for the first day, and 15 different subjects for discussion, with miscellaneous business and closing. He affixed to each of 15 subjects the names of one to three of the most noted and influential farmers he knew, or could hear of, within a radius of 20 miles of Woodside; though half of them probably, never spoke in public, yet good names on paper carry influence. Bill thought that Mrs. Mean's motto, "When yer gitten, git a plenty," was a good one to adopt in this case, as the local talent of Excellent County was an unknown quantity. The three committees to talk institute worked well. Having learned wisdom from experience, it was thought there would be less vacuity surrounding their meetings by meeting in Judge Forester's office. The room and the crowd would harmonize better in size, and the five chairs, a high stool and a table, would probably afford sufficient seating capacity. The good counsel of the Judge and his clerks could also be secured, and possibly some young farmers might drop in on business with the Court. When this second convention assembled it was gratifying to find there was an increased attendance of more than 200 per cent. The Committee on Arrangements had succeeded in interesting one of its members, appointed in his absence, and it had now a working force of three.

Election of officers was the first business of this convention. Mr. Edwards opened up the matter by saying:

"As Sheriff Nelan is President and Judge Forester is Secretary of the Fair Company, it has been thought advisable to put them in the same positions in the institute society, so as to carry influence in favor of the institute."

"I can't attend to the Secretary's business," said the Judge; "and you needn't put me in."

"I think," said Mr. Bark; "that farmers ought to attend to their own business, and not impose upon men who have no concerns in their calling, and who have enough other business to occupy their time and talents. If this institute business has not merit enough in itself to commend it without hanging on to the skirts of some other institution, we had better stop it now."

"Let us put Bark in for President;" said Frank Toes. "He understands parliamentary law, he is a good presiding officer, and will make the best President we can get."

"That is all very true," said Isaiah Hutton; "but I was thinking of him for Secretary."

"I don't care about Secretary, there is too much work in it, and there are younger men who can do that, though I am willing to do anything I can," replied Mr. Bark.

"I move you," said Mr. Toes; "that Bill Bark be elected President."

The "move you" prevailed and Bark took his seat.

"I move you that Jack Edwards be elected Vice-President."

The "move you" prevailed again.

"Now what will we do for a Secretary?" asked Mr. Hutton.

"There is Mr. Toes who will make a good Secretary," said the President.

Mr. Toes was elected Secretary, and Clarence Grady was elected Assistant. Mr. Grady was chief clerk in the Judge's office. Mr. Quiets was elected Treasurer; and the confidence in him was such that he was not required to give any bond.

Mr. Bark presented his capacious program, remarking that it was not yet complete, as it would be proper to add several more items, when the necessary information should be obtained.

"That's a good program," "First rate," "That'll do," and similar laconic expressions showed the sense of the meeting.

"Mr. Vice-President, I move you the program be accepted." The "move you" prevailed again.

Mr. Edwards of the Committe on Arrangements presented the financial question. "The program," said he, "'ll have to be printed; we'll want at least 500 of 'em, the speakers 'll have to be boarded, etc., and we'll have to raise some money, somehow."

"That is a matter that belongs to the committee," said Bark.

"We don't want to dun the people at the institute," continued Edwards, "it 'll have a bad influence; we don't know how much it 'll take, but there must be some plan to raise it."

"The committee can adopt its own plan and carry it into effect, I think" said the President.

Jack resumed, "If we don't have the money to meet the expenses, somebody 'll have to go down into his pocket after the institute 's over."

"How much will you give?" asked the President.

"I'll give a-half a dollar," replied Jack. "I'll give another and more if needed," said the Judge, "I'll give a-half a dollar," said Mr. Hutton; "I'll give another;" "I'll give a quar"—"Hold on here," cried the Secretary, "till I get this down." The President smiled, and said: "*That's* business."

There now being money to pay postage, the Secretary was ordered to notify every man whose name appeared on the program of his appointment to open discussion on the subject to which his name was attached, and ask him to donate towards expenses.

The committee was also instructed to solicit donations from the business men in town, and see if boarding and lodging and railroad fare could not be secured at reduced rates, for all parties attending the Institute. The time was set for another meeting, and the meeting adjourned.

Bill Bark, now having the Presidential harness fastened upon him, had to either pull or be called balky. So he concluded to pull, and show that "the way to have an institute is to just have it."

CHAPTER V.

THE third meeting was also held in the Judge's office and had a fair attendance. The institute circular for 18'—and 18'—had been received. It gave the information that Waldo F. Brown and W. N. Cowden were the speakers assigned to Woodside and that January——and——was the time. There was also a paragraph in it with an index pointing to it thus:

☞"Do not ask for changes of dates, or speakers, as it will be very difficult to make a change." This was all very satisfactory to all concerned, as it gave assurance that the institute would be well entertained, and also gave sufficient time to get ready. The Secretary reported that some of the local speakers had responded favorably. The committee had good success in collecting money, and all the hotels and boarding-houses except one, had given reduced rates for boarding.

"It might be well," President Bark suggested, "for the committee to make some conditional arrangements at some private houses, too."

"Oh, I think not!" replied Edwards, "five hotels and two big boardin' houses giv us terms, an' that 'll be enough!"

"It would not hurt to have a plenty," said Bark.

"Mr. Edwards, have you bound those parties any way?"

"No, they all just agreed to it, but there's no writin'."

"I think, for your own protection, it would be better to get them on paper, and then if any one refuses to keep his promise, the people cannot blame the institute managers for deceiving them," said President Bark.

"That would be a good idea," said Edwards "If you'll write out a little article, I'll do that."

"I'll do it," said Bark, and this matter was attended to.

It was asked where the institute would be held?

"In the court room," replied Mr. Grady. "It will not be in use then, and it will not cost anything to hold it there."

"It would be well enough," suggested the President, "for the committee to try and make a conditional arrangement for the Opera Hall, so that, if the court room should be found too small, the institute can be moved into it.

"If we git enough here to fill up inside the bar it's more'n I 'spect," said Mr. Edwards.

"The first institute held in M—the people all came inside the bar and it wasn't full."

"It might not be amiss," said the President, "to see where there could be some chairs secured, to increase the seats in the court room, at least."

The committee thought lightly of Bark's premonitions, but he thought the power of printer's ink was unknown.

"Was the committee arranged for printing programs?"

"I asked one editor what he'd charge to print it," replied Mr. Edwards, "and he said he'd do it for nothin', so I looked no further, we couldn't ask it any cheaper'n that."

"How many copies?" "500."

"Mr. Edwards, are you certain that he understood you?" asked the President. "He certainly thought you wanted him to just insert it in his columns."

"I think he understood me."

"He surely did not. All the papers will insert it in their columns, but to print 500 copies, that's job work, and he certainly didn't mean to do that for nothing."

"Well, I don't know!" said Mr. Edwards, "I thought he understood me, but I'll see about that."

This meeting adjourned to meet January—. Everything seemed to be in shape to move along swimmingly, now. The committee had its business well up, except in the matter of music. Mr. Edwards found that either of the papers would print 500 copies of the program for two dollars, and he left it to the President to get it printed when it was completed. The necessary knowledge being obtained he completed it and handed it to the printer.

When the next meeting was held it was ready for distribution, and three of the papers had inserted it in their columns. There was but one matter of importance to decide.

Mr. Edwards reported, "I've been talkin to the leader of the New Agreement choir, and they 'll come and sing for us, if we 'll pay their fare on the railroad, and board 'em."

"We have good choirs in town, but the male singers are engaged in business, and could not well leave their places of business during the day. This would necessarily interfere with the music," said Bark.

"The New Agreement fellows," said Mr. Edwards, "will come, and be right with us all the time, and they 're good singers, and there 'll be no trouble 'bout music."

"I move you," said Mr. Toes, "that the Committee be authorized to secure the New Agreement choir."

The "move you" prevailed again.

WANTED—A Guernsey Heifer about three months old, to be sent by express. Address A. SNEDAL, Denison, Texas.

IN Guy's (London) Hospital Reports, vol. 1, page 396, is found the statement: "Simple hypertrophy (enlargement) of the heart, especially of the left ventricle, is found without valvular incompetency. In this numerous class the cardiac is secondary (a symptom) to the renal affection." This explains why Warner's Safe Cure is effectual in cases of heart disease. It removes from the blood the kidney acid which causes the heart disease.

FULLY—ANSWERED.

"SUBSCRIBER'S" QUERY CAUSES COMMENT.

AS OUR readers will remember, a letter was published in our columns a few days ago, signed "Subscriber," which dwelt at some length upon a subject of general interest, and which contained several inquiries which will be found answered in the following:

To the Editor:—Several days ago I noticed a communication in your paper from "Subscriber," in which considerable comment was indulged in concerning the pamphlets which are widely distributed by Messrs. H. H. Warner & Co., of Rochester, N. Y. These pamphlets, as is well known, are published in order that the public may become conversant with the symptoms and growth of disease peculiar to the kidneys, and which is, it must be admitted, the productive cause, in a majority of instances, of other organic disorders. The publishers of these pamphlets are also the discoverers and manufacturers of the noted Warner's Safe Cure, which is known to be the only means for the prevention and cure of kidney disease, as can be testified to in every community. In the pamphlets referred to there appear a number of testimonials from parties who speak in the highest terms of how they have in many instances been restored to health by Warner's Safe Cure, after having been given up by doctors to die, and attached to those statements are the fac-simile signatures of the parties themselves.

I am personally aware that all the testimonials published by this firm are genuine and are the voluntary statements of persons who are anxious to manifest their gratitude for the unexpected return of health and vigor which Warner's Safe Cure has brought them. To make assurance doubly sure, it can be added that Messrs. H. H. Warner & Co., have for years, published a standing offer of $5,000 to any one who will prove to an impartial referee that any testimonial published by them is not, so far as they know, bona fide and absolutely true. What more does "Subscriber" desire to convince him, in addition to his own statement, that his neighbors all tell him that Warner's Safe Cure has done more good for them than they have received from the doctors.

In view, Mr. Editor, of the many persons who are sacrificed daily to the bigotry and ignorance of physicians who persist in treating patients for symptoms, called consumption, apoplexy, brain troubles, and nervous disorders, when the real cause is disease of the kidneys—which should be detected and quickly eradicated by the use of Warner's Safe Cure—I maintain that the value of those pamphlets which place in the hands of the public the means of knowing the truth, cannot be overestimated. FAIR-PLAY.

THE EFFECTS OF TILLAGE ON SOIL MOISTURE.--This subject is discussed by Prof. W. O. Atwater in Bulletin No. 2 of the Storrs School, Experiment Station. Prof. A. states, what many farmers have observed, that hoeing and cultivating the soil help crops to withstand drought, but the fact that such tillage is often worth more than manure, and the reason why it is so useful, are things that need to be better understood. It was for the purpose of preparing facts that should lead to a better understanding of the true value of such tillage that the experiments recorded in the bulletin were conducted. Eight cans, each 30 inches deep and 10 inches in diameter, were filled with soil—four with a light upland and four with garden soil. Arrangements were made to accurately measure the amount of water falling into the cans. The surface of the soil in two of the cans was stirred frequently—one to a depth of two and the other four inches, while that in the other cans was left undisturbed. Thus it was attempted to supply the conditions found in the soil of the cultivated field. The experimenter knew exactly how much water fell into the cans, and he could also tell at any time he desired, how much was left—hence how much had evaporated. The plan was to see which soil contained the most water—the one with the compact surface or the one that had been stirred to a reasonable depth. The results show most emphatically that both kinds of soil lost more water when left with their surfaces compact than when the surface was stirred. It was also shown that the heavier soil lost more water than the lighter. Having shown that surface tillage tends to conserve soil water, a fact that most farmers have satisfactorily proved to themselves, Prof. A. goes on to show *why* this is so. Here, in brief, is what he says:

The earth acts as a reservoir for water as a lamp acts as a reservoir for oil. Part of the water that sinks into the earth evaporates before it reaches the lower strata of the soil, another part forms "ground water" which is found on digging for wells, etc. In dry weather this ground water is continually rising to a point where the roots of plants can reach it. The force that raises this water is the force of capillarity, the same force that draws oil up the wick of a lamp or causes water to spread through a cloth of which a corner is wet. This force tends to draw water from a wetter to a drier soil and the ease with which it comes depends upon various conditions. One of the most important is the size of the passages through which the water is to pass. These should be fine, but should not be entirely stopped up. They are too coarse in common sand, while in clay they are often clogged. Thus the texture of sandy soils will be benefited by admixture with clay and clay by sand. These pores or passages should not be too large, and there should be a continuous system of them. Stirring or loosening the soil makes the pores larger and breaks their continuity so that water is hindered in its passage. A compact surface helps the water to come to the surface where the sun's heat changes it to vapor and the wind carries it away. If the surface soil be loosened, it will hold more air, which is a poor conductor of heat. Thus it acts as a mulch, keeping the soil below cooler, holding the water below against the dissipating influences of sun and wind. Thus we see that cultivating the surface of the soil assists nature in carrying out the plans of the husbandman. The stores of water are permitted to rise to the roots of plants but are hindered from evaporating and passing away into the air.

THE USE OF NIGHT-SOIL IN JAPAN.—The R. N.-Y. has received bulletin No. 3 of the Imperial College of Agriculture and Dendrology, Komaba, Tokyo, Japan. In this pamphlet Dr. O. Kellner gives the results of his researches in the composition, treatment and application of night-soil, and also some facts regarding the valuation of other Japanese manures. The bulletin is well printed in English and is, in the opinion of the R. N.-Y. the most valuable treatise on the value and use of night-soil that has yet appeared. We have all heard of the wonderful agriculture and horticulture of Japan. In that country, small savings of manure lead to a grand crop result. Soil culture is conducted under the most intensive system possible. In America, stock growing is considered the corner stone of farming. In Japan, domestic animals are largely dispensed with and instead of computing the manurial value of the food given to stock, the scientists estimate the manurial value of the food consumed by human beings. To show the extent to which this computation is carried, we may state that in this pamphlet, citizens are divided into four classes and samples of the night-soil from each class are analyzed for comparison. These classes are farmers, who are supposed to live almost entirely on vegetables; ordinary citizens of the towns who eat somewhat better food; middle class officials who are still better cared for, and soldiers and students who are supplied with a moderate quantity of meat, and whose food closely resembles that eaten by Europeans. Analyses of those different samples of night-soil revealed the following differences—the figures represent the per cent. of the various substances.

	NITROGEN.	POTASH.	PHOS. ACID.
Farmers,	5 51	2.95	1.16
Citizens,	5.85	2.88	1.33
Officials,	5.70	2.40	1.52
Soldiers,	7 96	2.07	2.97

This may look like very small business to the American farmer, but it is by means of just such careful investigation and such thorough attention to fertilizing principles, that Japan is enabled to support her great population, and while speaking of this question of the relation of the quality of food to the value of manure, it may be well to give Wolff's figures regarding the value of the excreta of Europeans.

	NITROGEN.	POTASH.	PHOS. ACID.
Japanese (average),	5.7	2.7	1.3
European,	7.0	2.1	2.6

It will be noticed that the Japanese night-soil is slightly richer in potash than the European, but considerably weaker in phosphoric acid. Again, it is more dilute than the European, as the Japanese are notorious for the great quantity of salt which they consume. They drink more water than any other people. The slight excess of potash is due to the fact that their diet includes so much vegetable food, which is generally rich in potash. So much for the manurial value of night-soil. Now for the manner of obtaining this value in actual culture.

Japanese farmers have frequently noticed two things about the use of night-soil. Fresh manure, applied in a pure state and without undergoing fermentation, never has a good effect. The plants manured with such dung are very liable to wilt. It has also been noticed that night-soil is a one-sided manure. When applied to grain crops it invariably has a powerful effect on the tillering of the young plants, causing a great growth of stem and leaf. Before the formation of the grain, however, this function stops, the plant suddenly seems to become stunted, and the grain formation is seriously checked. Experiments conducted at the Imperial College show that soils have not the power of absorbing urea, which may be said to be the most important principle of fresh urine. Now, when fresh urine is used, the urea remains in a dissolved condition in the soil.

The concentration of the fluids in the soil may become so strong that the absorption of water by the roots is interfered with, so that the green organs are caused to wilt. Either this may happen or the urea may be washed out of the soil, by the rains, and carried to a point where it is of no value as a fertilizer. When the night-soil is decomposed, this urea is changed into a form of fertility that can be utilized and stored up in the soil. It is not strange therefore that Japanese farmers never apply night-soil until it has passed through a thorough putrefaction. For this purpose it is diluted with two-thirds of its bulk of water and stored in large wooden tubs until a greenish color makes its appearance at the top. It is then considered suitable for application. It is quite customary in this country to use disinfectants like carbolic acid and sulphate of iron in privy vaults. Experiments were made in Japan to see what influence these disinfectants had on the agricultural value of the manure. It was found that the disinfected excreta may cause the same loss to the crop that is caused by the unfermented manure, and the disinfectant may also prove poisonous to plants. With regard to the one-sided fertilizing character of night-soil, Dr. Kellner repeats what the R. N.-Y. has repeatedly stated, viz:—that the night-soil is not evenly balanced: it contains too little potash and phosphoric acid for its nitrogen. This is seen by its action on the grain crop. The soluble nitrogen induces a tremendous growth of leaf and stem, but there is not enough of the other elements to finish out this growth and complete the plant as started. Potash and phosphoric acid must be supplied. The Japanese attempt to do this by composting straw, leaves and refuse with the night-soil, or by applying wood ashes in the hill or drill while the night-soil is applied to the surface of the soil in a semi-liquid form. Phosphates would be applied in a similar manner if they could be obtained in Japan. Doubtless the time will come when they will be carried there from other countries. Another point of considerable interest brought out by these researches is the fact that night-soil manures are not so well suited to light, sandy soils as they are to those more compact.

EXPORTATION OF MEAT FROM THE ARGENTINE REPUBLIC.—This is the title of a pamphlet sent out by the Argentine Rural Society. We have heard much about the business energy of the Argentines. This pamphlet would indicate that the people of that southern republic are well worthy their reputation. It appears that Argentine desires to take a hand in the work of supplying the world with meat, both frozen and preserved. Argentine beef has heretofore had but a poor reputation—particularly in England where the most desirable market is located. The President of Argentine sent a letter to the Argentine Rural Society asking the members various questions regarding the present condition and future prospects for Argentine cattle, and also calling for suggestions as to the best way to develop the desired trade. This pamphlet contains these questions and the answers given by the society. It would appear that the cattle of Argentine, are, as a rule, superior to Texas cattle, while they are rapidly improving in quality, as some of the very best Herefords and Shorthorns are being taken to Argentine for breeding purposes. Experiments thus far made in shipping frozen mutton and beef, have not been fully satisfactory—this is admitted by those who write for this pamphlet—but the reasons why satisfaction has not been given are clearly pointed out and there is no apparent reason why the faults cannot be remedied. The government of Argentine proposes to give $1,500,000 to the work of building up the export meat trade. Prizes will be given for the best methods of packing, and rebates of taxes will be made to all who put a certain amount of capital into the business. It seems safe to say that Argentine is determined to secure a share of the world's meat trade. When she does secure her share, the agriculture of more than one country will have to be shaken up and newly adjusted.

FUNGOUS DISEASES OF PLANTS.—The directors of the Connecticut Experiment Station announce in bulletin No. 97 that they propose to extend their field of investigation by the addition of a new department in which provision will be made for the careful study of rusts, smuts, rots, mildews, blights and similar diseases. It is proposed to investigate onion smut first. A list of questions have been proposed, which onion growers are requested to answer. Thus it is hoped to prepare a valuable "symposium" on the subject. Send to the station (New Haven, Conn.) for the questions.

BOOMER & BOSCHERT PRESSES.—Catalogue from the Boomer & Boschert Press Company, Syracuse, N. Y. This is an excellent pamphlet in which the manufacturers state, in a simple and straightforward manner, their reasons for considering their presses superior. Those who desire anything in the cider making line will find what they want at Syracuse. Printed on the back of the pamphlet is a picture entitled "Ye Good Old Way" that reminds one of the famous scenes in "The Old Homestead."

SUNBEAM WALKING CULTIVATOR.—P. P. MAST & Co., of Springfield, Ohio, send us their new catalogue describing and illustrating this excellent implement. There are several distinct features in the construction of the "Sunbeam," that call for particular mention. One of these is the use of the parallel iron-jointed beams, which are undoubtedly one of the greatest improvements ever made on corn cultivators. The rear ends of the beams are pivoted to a cross-head to which the shovel standards are attached. There is also a secondary beam or rod pivoted to the coupling in front and to the cross-head in the rear, which holds the cross-head with the shovels, parallel with the axle, whatever may be the position of the beams sidewise, which enables them to do much better work and to be more easily handled. This feature will commend the cultivator to anyone who may see it. The inside standard can be adjusted up and down on the cross-head, a feature very desirable for plowing listed corn or other crops where there are ridges and furrows. There is a spring at the front end of each beam so arranged as to support the beam when in use, which enables the operator to move them easily on either side, and assists in raising them when he wishes to hook them up while turning at the end of the row. The draft rod is so attached that it relieves all the weight from the horses' necks, and the evener is so arranged that it divides the draft equally and does not turn the wheels out of the line of draft.

We show a picture of the "Sunbeam" at figure 112, in which these parts are shown.

AMONG the blind the one-eyed is king. The one-idea of

Warner's Log Cabin PLASTERS.

is to strengthen the foundation of health, and thus insure health. Best and cheapest in the market. All druggists keep them.

The Mapes Manures for { Cabbages, Cauliflowers, Tobacco, Onions, Melons, Pear, Peach and Apple Orchards, Vineyards (for wine and market), Small Fruits, all Truck Crops, Tomatoes for Canning, Sweet Corn, Field Corn, Grass Top-Dressing, etc.

Applications may be made also at any early stage of growth, scattering evenly over the surface and working in when practicable.

The Great Skill in the Mapes Manures.

[*From the Farm Journal, Wilmer Atkinson, Editor—Philadelphia, May,* 1889.]

Mapes' Manures give surprising results to those who use them, and we believe the reason is that the ingredients are mixed with brains. It is said, besides, that the raw materials which compose them costs within ten per cent. of the cost of manure ready to apply to the soil. This latter statement is apt to be true; the former we are certain is true. There is great skill shown in having the Nitrogen, Potash and Phosphoric Acid just in the right proportion, in the proper form, in the right fineness and solubility, so that action is prompt and certain. Often the elements in a fertilizer are present as shown by the analysis, but they are not in condition to act, and the benefit is not apparent; but Mapes seems to have everything just right and his manures are perfectly sure to do the work required of them. This is our experience.

HOW TO IMPROVE MEADOWS

WHAT GRASSES ARE FAVORITES?

WHAT TOOLS ARE USED?

HINTS ON

Seeding,
Curing,
Handling,
Fertilizing,
Feeding,
Selling.

QUESTIONS.

1. *What grasses are sown for hay in your county? Do you favor early or late cutting? Why?*
2. *Give a list of improved haying tools in general use.*
3. *How often do you seed down? With what crops? What season?*
4. *What is the average yield per acre and what manures are used?*

Any new grasses or substitutes tried recently?

9. *What, in your opinion, is the best way to increase the productiveness of our meadows?*

MEADOWS AND HAY.

C. S. RICE.

In this vicinity meadows are usually seeded with a mixture of Red clover and Timothy. If six or eight quarts of Timothy and the same amount of clover seed are sown to the acre on land in fine condition, a good stand will usually be obtained, and from two to three tons of excellent hay can be cut from an acre at one cutting. If the crop be cut when the clover is in full bloom and rightly cured, the hay will be far more valuable, not only for cows but for all kinds of stock, than it will be if cut later in the season.

Early cutting of such a meadow also insures a large amount of after-growth that can be cut and cured for hay or used as pasture for the dairy through August and September and a part of October. I have used the second crop for pasture for the last 15 years with great profit to the dairy and no damage to the meadows. The cows may be turned on when the feed is eight or 10 inches in hight, and a large amount of excellent feed can be saved through the fall without feeding so closely as to injure the next year's crop.

Good land seeded as above stated, will continue to yield two tons of hay to the acre for three to five years without manure except 100 pounds of plaster to the acre for the first and second years while the clover forms the largest portion of the crop. This result is obtained in spite of the pasturing, which is generally thought to be ruinous to meadows. No doubt the clover roots decaying in the soil greatly increase the crop of Timothy in the third and fourth years.

The value of clover for hay and of its roots for manure is so great, and the large after-growth of a newly seeded meadow is so certain that it is not best to let land remain in Timothy if the yield falls below two tons at one cutting. It is true that the yield may be kept up by top-dressing, but the profit arising from manure used in this way will not be so great as when it is applied while the land is being tilled for the growth of other crops. The benefit of manure is not as lasting when applied on the surface of a meadow as when thoroughly mixed with the soil just before seeding.

The best method by which to improve meadows is improved general farming. Feeding clover and grain, and saving rich manure in a water-tight gutter with plenty of suitable absorbents, will do much to insure success. A soil made fine and free from weeds by thorough and careful tillage is essential to the best results. My experience has proved that with a course of ordinary farm crops and a limited amount of labor, good meadows may be secured and a fair profit realized by management about as follows:

A field of six acres that has been in meadow for four years and has yielded an average of more than two tons to the acre, besides giving a large amount of pasture each year, was manured last fall with 12 large loads of rich manure to the acre. As it is now a good Timothy sod it would, no doubt, yield two tons to the acre this year, but greater profit can be made by plowing and drilling corn for fodder. Next year potatoes will be raised there, bone and ashes being used as a special manure. The third year another application of 12 or 15 loads of stable manure to the acre will be made and the field seeded with barley, peas and oats mixed, for the grain crop, and eight quarts of Timothy, and the same of clover seed to the acre for meadow. I formerly seeded with wheat or barley, but wheat is not a profitable crop now and a good stand can usually be secured with mixed grain. I think that the good effects of bone and ashes used on the potato crop extend to the grass for many years. During the next three years this field will receive thorough cultivation with the best improved tools for the crops mentioned, and, judging by past experiments, I shall confidently expect fair profits and a good meadow for at least four years thereafter. If it were convenient to employ more help on the same land, I would, for profit and rapid improvement of the soil, adopt a four-year course, raising corn-fodder and potatoes on clover and Timothy sod the first year, and re-seeding the second year with the mixed grain, and cut clover and Timothy the third and fourth years and then plow again. Alsike clover makes good hay, but does not yield much aftermath and can never fill the place of Red clover in the improvement of the soil.

I have used millet and Hungarian grass for soiling crops and for hay, but I do not cultivate them now. Clover and corn are more profitable for soiling and also for winter feed. I have tried Orchard grass, but would not use it for meadow if the seed were furnished gratis. On low land not suitable for growing corn and potatoes, I have used the meadow mixture sold by seedsmen for permanent results. An occasional top-dressing in the fall will secure a good yield of hay, and it can be cut later in the season than clover or Timothy and still be of good quality. The hay is relished both by horses and cattle. If cut early, it gives very good after-feed. The sod formed by this mixture will remain uninjured where clover and Timothy would be thrown out by the frost and killed.

Hay should be cured with as little exposure to sun and wind as possible. It should be raked as soon after cutting as it is sufficiently made so that the rake will do good work, and if the weather is fair, it may be cured in the windrow. If there is danger of rain it should be cocked. For 14 years I have used Faust's hayloader with the best satisfaction, and most of the hay has been raked while quite heavy and has been cured in the windrow for convenience in loading, and the labor of cocking is thereby saved. Very little damage has been done by rain or dew. There are no hay tedders in use in this neighborhood and I do not think that I have any use for such a tool. I have used a horse fork for unloading for 30 years. The double-harpoon fork is, I think, the best. An agent put up a hay carrier on trial a few years ago, but soon removed it as it did not give as good satisfaction as the usual method with pulley blocks alone. Our mows are quite large, extending 30 feet back from the floor; but by hitching the fork in different places, much of the labor of mowing a way is saved, and the team has a less distance to travel than with the carrier, and the unloading is done in less time. A drive-way convenient to the main floor is reserved for the use of the team in unloading and all the mows can be filled without changing the cart to which the rope is attached, to different places. This drive-way is afterward used for storing straw.

To improve the meadows on an upland farm in Northern New York I would feed all the hay and grain raised on the farm. I would keep improved stock that will pay a profit on purchased grain feed. I would buy and feed a large amount of bran, corn-meal and cotton-seed meal, and carefully manufacture and apply a large quantity of manure to tilled crops.

I would use a large amount of grass and clover seed. I would work the soil thoroughly with the best improved tools. By a well arranged rotation of crops, I would do away with old meadows entirely. A 100-acre farm so managed will afford more profit than 200 acres largely devoted to old pastures and old meadows.

Lewis Co., N. Y.

THE QUESTIONS ANSWERED.

L. F. ALLEN.

For hay in the city markets Timothy is most in use as horse feed, though it is not, in my opinion, really the best, but it is popularly preferred. For best consumable quality it should be cut when in early bloom, with the blue shade on the head when cut. Later, when full-grown and ripening seed is formed the stalk becomes hard and woody, and of largely decreased value in nutrition. A good way to seed it is to sow it in September with a crop of wheat or rye—six or eight quarts to the acre—and the next spring sow four quarts of common clover with it, or two quarts of Alsike clover, as the latter's seed is but half the size of that of the common Red clover and the quantity mentioned will give as many roots to the acre as double the amount of the other will do. This latter mixture of the seeds is for ordinary stock feeding on the farm; yet in my opinion, from many years' experience, it produces hay equally good for horses.

There are several kinds of mowing machines in general use. Each is preferred according to the tastes of those who use it, and most of them are good. When the crop of grass is heavy, the horse wheel spreader should be used, as it dries the hay in much less time, and makes a great saving of manual labor over spreading with the fork in the old-fashioned way. When sufficiently cured—not absolutely dry—the hay may be gathered into the wagon either from the windrow or cock.

When the crop runs out, either by previous drought or poverty of soil, plow the ground and seed anew with a grain crop and a generous application of barn-yard manure—Timothy in the fall or spring. Clover should always be sown as early in the spring as possible when the frost is out of the ground.

The amount of yield per acre will depend upon the fertility of the soil, ranging from one to three tons. The usual average on our farms is about one and a half ton, depending on the extent of rains we have. A wet May usually gives a fair crop of hay, and if the rains extend into June, all the better. A very dry spring diminishes the crop severely.

I formerly used the common Red clover mixed with Timothy seed, but it usually stays in the ground not more than two years for a crop. For the past four or five years, I have substituted Alsike, as its fibrous roots hold longer in the soil, and, branching from near the root, it makes finer hay, and all kinds of stock like it in preference to the Red as sweeter and finer in quality. If mixed with Timothy it blooms some days later than the Red variety and comes in better season with Timothy and lasts as long in the soil. The common Blue grass, cut in proper season, makes excellent hay for all kinds of stock; but being shorter in growth, the crop is much lighter than that of Timothy or clover. Orchard grass makes a fair quality of hay, coming forward earlier in the season than any of the others, and it should be cut when just coming into bloom; if left later the stalks become coarse and woody, not much better than early cut oat straw. When Red clover is grown with it, the clover blooms later and they are not exactly in unison with each other. For some years I so grew them, but have now abandoned the practice. For pasture, a mixture of Orchard grass with Blue grass and the clovers is exceedingly valuable, as it grows rapidly after feeding off, which the others often fail to do. For dairy cows clover hay is altogether the best, and for the most economical use should always, as with the grass hay, go through the cutter.

Barn-yard manures, either coarse or rotted, are the best fertilizers for meadows, and spreading them early from the Kemp machine is altogether the most economical way of applying them, and if any be unevenly spread, as may sometimes be the case from want of uniformity in composition, a smoothing harrow should be applied, which will spread the manure in perfection. Chemical manures may also be added if necessary, but they are not so lasting in their effects. On light soils, gypsum, applied just as the crop is

starting in growth, is oftentimes of great service. There is hardly a crop on the farm in regard to which so much neglect is displayed in cutting and curing it in its proper season as our hay, to the great detriment of its quality, as well as of its marketable value.

HAYING TOOLS AND IMPROVEMENT OF MEADOWS.

PROF. I. P. ROBERTS.

TOOLS and implements are so numerous and so much improved in all directions that it is impossible to give a "list of them" without taking up several columns. On large farms a mower should have a wide cut; it should leave the grass loose and untramped by wheels or the feet of horses and as nearly in the position in which it grew as possible. The Eureka mower comes nearer to filling the above conditions than any other one with which I am acquainted. There is but slight difference in the self-dumping hay-rakes; all that are well-made are good. Hay tedders are too expensive for most farmers, considering their liability to get out of repair and the little time they are in use. Then, too, unless they are used with the utmost judgment they seriously injure the quality of the hay.

The hay-rake may often be made to serve the purposes of a tedder without injury to the leaves of the grass. The hay should be raked fairly green, left for a few hours till wilted or nearly dry and then turned over with the rake, the operator holding to the lever till the windrow has been inverted. In extreme cases this operation may be repeated. Hay should be cured as much as possible in the bunch: therefore it would appear to be better economy to buy hay-caps than tedders. We are about to make a careful test of the value, cost and durability of hay-caps.

Hay loaders even of the best kinds can hardly be recommended for general use. They all imply drawing hay from the windrow or unraked, and this is not the right method or the best method. Better spend the money for hay-caps than for hay loaders. The best contrivance for unloading, where the barns are sufficiently ample to justify track, ropes, etc., is the sling, which takes off from 700 to 800 pounds at a draft and does not tear the load to pieces or drop large portions of it on the floor. This hay and grain unloader or sling is certainly the best contrivance, except possibly where the location of the barn will permit drawing the wagon and load into the very top of the barn and the method of upsetting the entire load with one short pull.

The greatest improvement and saving in securing the hay crop yet remains to be generally adopted. I refer to the truck wagon. This has low, broad wheels, 30 inches in diameter, and axles six to 12 inches longer than those of the ordinary wagon. Instead of the ordinary rigging, a flat one made chiefly of boards, 14 feet long, and eight feet wide is used. The unusual width of the rigging and the lowness of the load obviate at least one-half of the labor of getting the hay on the wagon, save the loader (in fact a loader is hardly necessary) and obviate all sliding off or upsetting of the hay. No farmer can afford to be without the low, wide-wheeled, long-axled truck. Finally, in fact, there is not a single really poor haying implement made. Some of them lack in the quality of the material used; especially is this the case with the wooden parts.

Two methods are open to us in the improvement of meadows. If they are rough and hopelessly unproductive, the heroic treatment will be found best. Plow, replow, level, clear off all stone and stumps, fertilize and re-seed, using some clover, which will disappear in about two years. By this method plant food will be set free at the surface and with that, added by fertilizers and that brought from the subsoil by the clover roots, there will be enough available fertility in the surface soil to produce many abundant harvests. The second method is to thoroughly scarify the surface with a sharp-toothed harrow in the spring of the year, sow a little grass seed and one or two hundred pounds of commercial fertilizer per acre and roll with a heavy roller. This, of course, should be done in addition to giving the meadows a light coat of fine manure either immediately after haying or later in the fall. If the meadow is overgrown with moss an application of lime, a little grass seed, the harrow and the roller will work wonders. Where it is desirable to have the meadows permanent, little or no pasturing should be done in the fall.

Ithaca, N. Y.

VIRGINIA HAY-MAKING.

H. L. WYSOR.

THE combination of grasses grown for hay in this section is either clover and Orchard grass or clover and Timothy—generally the latter. Timothy is invariably sown in the fall with wheat, as it seldom gives a good catch when sown in the spring. Clover and Orchard grass are usually sown in March or April on wheat or with oats. The best catches are now obtained with oats, unless a sod has been broken for the crop, in which case it is better to rebreak the stubble for wheat before seeding down to grass. It is not necessary or desirable to use other grasses for hay than those mentioned, since this country is the natural habitat of Blue grass, which in a few years drives out all cultivated grasses and takes possession of the land. When this occurs, if hay is wanted, the meadow must be broken, planted to corn and re-seeded.

Orchard grass is not held in as high an estimation, either for pasture or hay, as Timothy; but it succeeds better on dry soils. It must be cut when in bloom, for if allowed to ripen, it is not as good as wheat straw. It and clover ripen together, and are mown here about the middle of June. Timothy is harvested a month later. The best farmers favor early cutting, especially for Timothy. The early cut hay is more palatable to stock, and the aftermath is more abundant. When Timothy is allowed to ripen its seed before being cut, it seems to destroy the vitality of the plant, and the aftergrowth sometimes does not start for weeks, and in case of continued dry weather very often not at all. On account, however, of the pressure of work in the corn-field or in the wheat and oat harvests, haying is very often delayed far beyond the time when it should have been attended to.

No machines, except, of course, the mower and the horse-rake, are used here as a general thing. Hay tedders and appliances for loading or unloading are not common. The hay is usually stacked in the field, and for this purpose is put up in small cocks, which, after being allowed to settle for a day or two, are hauled up to the stack by means of one horse and a chain or grape vine, and they are then pitched by hand.

The average yield per acre of dried hay is probably less than a ton, though the best meadows give double that quantity or more. No manures are used except the commercial fertilizers employed in seeding down, from 150 to 300 pounds per acre. The cattle men feed on the meadows through the winter, but the tramping done by the stock in wet weather more than counterbalances any benefit derived from their droppings and litter. In a few instances meadows are top-dressed by those who keep their stock in barns, but stable manures are more commonly applied to other crops.

From my own experience, the best way to increase the productiveness of meadows is to apply, every three or four years, 200 or 300 pounds per acre of raw bone-meal and harrow it in with a sharp tool. The Acme, I should think, would be excellent for this purpose. This, I am satisfied, will in many cases double the yield. Bone-meal with me has always shown more effect on grasses than any other commercial fertilizer.

I am trying this spring a small quantity of Texas Blue grass received from the Department of Agriculture. The seeds are bound up and connected by means of a kind of lint, which prevents their being separated or scattered. Unless some way can be devised of ridding them of this lint, they cannot be made available or become an article of commerce like Kentucky Blue. They are at present offered by seedsmen at $3 per pound, a price which permits of their use only for experimental purposes.

Japan clover seed is now grown clean and

PORK.—Section through fifth rib. Upper "fed for lean;" lower two fed in the ordinary way. Fig. 118. See page 340.

free from dirt in Louisiana. The seeds ripen in Eastern Virginia in September, but the grass does not grow high enough to admit of cutting it for seed, unless sown with oats, and then frost comes too soon for the seed to mature. The season being longer in Louisiana, seeds mature easily there. They are sold at from $5 to $6 per bushel of 26 pounds. This so-called clover has not been tried here, and it is doubtful whether it would be of any particular value even if it succeeded. It seems to be growing in favor in the Piedmont section of the State, where in some counties it is rapidly spreading. Mr. Rowe, of Fredericksburg, speaks highly of it as a nutritious grazing plant, and says it is also valuable for hay on rich soils.

Our great stand-by for pasture in this section is Wire or Flat-stalked Blue grass (Poa compressa), which in general estimation has no equal for fattening cattle. Unlike Kentucky Blue, it is almost indifferent as to soil, growing equally thrifty in sand, clay, or gravel, on rich or poor land, while for the latter, the soil must be in good heart and composed of heavy clay or limestone. The Poa compressa is now offered for sale by seedsmen under the name of Canadian Blue grass; but it can be had, I believe, only in small quantities. It has never received that attention from the agricultural press to which its merits entitle it, thriving under neglect and mistreatment which would mean death to any other tame or cultivated grass.

Pulaski County, Va.

CURING CLOVER.

T. B. TERRY.

FIFTEEN or 20 years ago it cost me much more to cure clover hay nicely than it has of late years. I got a lot of hay-caps, about six feet square, and wilted the clover a little, and then put it up in nice, high cocks and covered them. After standing three or four days, these were opened slightly, and the clover was aired; then it was put in the barn. This made the choicest of hay; but as we seldom get more than $10 a ton for it from feeding it out, the cost was too great. After much experimenting I have settled on about the following plan of curing: I watch the barometer (I have had 25 years' experience at this) and the weather. When, after a storm, the weather seems to be clearing, and the prospect is good for some days to come, I go out about 2 p. m., with my Eureka mower, and cut one of my strips—about six acres (I say "strips" because that is what they are—the best possible shape for fast work). I get through easily by six o'clock. The weather is then so cool, or partly cloudy, that the clover cut after two o'clock will not cure enough to incur any injury in the dew that night. While I am mowing, my man will be at work on another "strip" of potatoes. The six acres will usually make about 20 large loads of hay. This may seem a good deal for a small farmer to cut at once. It would be three or four days later, when there was danger of another storm soon. The point is to cut a lot at just the right time.

The next day, if my weather eye served me rightly, it will be clear and moderately warm. I do not touch the hay until nearly three o'clock; then I rake it as fast as possible into large windrows. By going the right way I can throw the buts of the clover up and leave few heads or leaves exposed. This after the Eureka mower. I take pains to rake a snug windrow. Notice no hand labor is put on the hay. My man still works in the potato field or among the berries. The next day should be bright and quite warm. As soon as the clover in the windrows is dry and warm on top and part way down, we go through the field with forks and roll the windrows right over on to dry, warm ground. As soon as the other side (then the top side) of the clover is warm, thus being clear through, we begin to draw into the barn with all the speed possible. I generally have extra help, so that we get in 12 or 15 loads that day. The rest lies over until next day; but we do not turn any more windrows than we think we can get up. All the hand work, beyond pitching, you will notice, is the simple turning over of the windrows with a fork, which is a short job. In this way it takes scarcely any more work to cure clover than Timothy.

We aim always to have the hay hot when it is drawn in. We do not draw in later than six o'clock, and would prefer not to load any after five, as the hay usually begins to gather dampness by that time. Just the moment it begins to grow cooler, that moment the air begins to deposit the moisture that it cannot longer hold. As long as it is growing warmer the air is taking the moisture from the hay, or any thing else it comes in contact with; but when it is becoming cooler your hay is taking the water back from the air. One cannot make good clover hay and ignore this fact, and still very many try to. The time to draw in is during the hottest part of the day.

Now the above is my general plan. It makes choice hay at slight expense for hand labor. I should say that in the afternoon, when my men are getting in the hay, if the weather is still favorable, I mow some more; but not as much this time. If it is very hot and dry the next day, one can draw his hay in in the afternoon, usually. The idea is that for several days after a storm the ground is drier and the air hotter, and hay will cure quicker. Now, if at any time during the above operations, the weather failed to follow the predictions of the barometer, and rain was likely to come, of course, the hay was cocked up, or secured in the best shape possible under the circumstances. But I think I may safely say that, three years out of four, we are able to avoid almost all hand work.

One point: We do not have more clover than we can take care of in due time, in any ordinary season—not over about 40 loads at the first cutting. In the worst season I ever knew I had six acres in cock during two weeks of rainy weather. Every one said it would be ruined; but between showers we built the cocks over, thus airing them and bringing the green clover at the bottom on to the top. They were built about six feet high and nicely fixed on the top. I did not try to get this hay in between showers, as then it would have been ruined, as there was not time enough to get it entirely dry. When the weather finally became settled and warm and dry, we aired the hay thoroughly, and it was good enough so that our work horses did well on it without any grain.

Many of my neighbors, I notice, are now using a tedder to hasten the drying of their clover. This answers them well. With a side-cut machine and tedder they manage to cure their clover about as quickly as it will cure after my mower without any tedding. Secretary Bonham and other good farmers in Southern Ohio cut heavy clover in full bloom and put it in the barn the same day. In this latitude I cannot do this. In a very dry time, and with the clover a little past full bloom, or with a small crop, I have done it and came out all right. In Wisconsin they put up clover with less curing than will answer with me. Their climate is drier.

My barn is tight and we shut all doors as soon as the hay is in, to keep out cool night air. In this way one can put in clover green and have it keep. In some years there is much more sap in the clover than in others. Take a few stalks and twist them very tightly. If no juice comes out, the clover will require less curing than when you can squeeze out drops of sap. It requires more experience and good judgment to cure clover cheaply and nicely than to cure Timothy; but it is better hay when you get it, for most purposes, and it leaves the land in far better condition for the following crops.

Summit County, Ohio.

HAY IN THE PIEDMONT BELT OF SOUTH CAROLINA; HAY GRASSES AND THEIR SUBSTITUTES.

J. C. STRIBLING.

NONE of the tame or cultivated exotic grasses are sown here to any considerable extent for hay except Bermuda. Our indigenous or native grasses, such as Crab grass, Cherokee and some other lowland grasses, make fine hay when cut early and properly cured, but when cut late they make inferior hay of no more value than good oat straw. Clover is sown to some extent as a kind of pet-patch for both hay and soiling purposes, and I have seen some fine yields of the Mammoth Red variety—from two to nearly four tons per acre and it has made three fair crops in one year. This was, of course, under favorable circumstances.

Of all the substitutes the cow-pea is most used and German millet and Hungarian grass next. The latter is a failure except on the richest land well prepared, while the cow-pea grows well on all kinds of land and with the rudest cultivation imaginable, and invariably improves the land, whether the crop is removed or not. Peas are drilled in or sown broad-cast after small grains have come off, in June. For drilling we mark off rows 30 inches apart with a small plow; drop in the seeds and cover them with two more furrows, and the after cultivation consists in plowing out between the rows and one plowing with the cultivator.

For pea-vine hay sow two bushels of seed to the acre after small grain. Either plow in with a small turn plow or use a Cutaway or Disk harrow. When the earliest pea pods are nearly grown, cut with a mower and rake at once in piles or cocks, or cut with a table-rake reaper throwing as much as possible in a place, and never stir or move the hay until it is thoroughly cured; then load directly into wagons. Handling or raking pea-vine hay after it is partially cured, causes the leaves and small stems (the most valuable part) to fall off which accounts, no doubt, for the poor quality of this hay when made in the same way as grass hay. Pea-vines thus cocked up green will stand rain for several days and cure out green and fair hay that my stock actually prefer to Western hay, and I have sold fat cattle in March that had nothing to eat from the barn all winter except this hay, which may be classed as both grain and hay.

Native grass hay is not a success in general, as this kind of grass does not grow tall enough to mow except in rainy seasons or favorable localities or in rich soil; but it makes finer hay when cut early, and as there is always abundant seed in the soil, it is cheaper than other hay by the cost of seeding.

Bermuda hay is made like hay from other grasses, only I think it can be put up with less curing or risk of molding. One seeding or setting does for all time and to renew the growth one only has to plow and smooth off again. Unless the land is very smooth much of our Bermuda is too short to mow and a good stand of Bermuda averaging only 12 inches tall will yield over one ton of hay per acre. I have, this spring, run a sharp-toothed angle steel-frame harrow over about ten acres of Bermuda meadow and look for good results from this cultivation which no other grass could stand, and I think that if I had sown about 200 pounds of ammoniated dissolved bone to the acre before harrowing, it would have paid.

The latest thing in haying tools with me is a new steel wheel combination one or two-horse rake. My experience is that the wheels are the first part of the rake to give way, hence the advantage of steel wheels and when it comes to bunching hay, it is disagreeably hard work for both man and horse unless two horses—one on either side of windrow—are used. One horse can be worked to this rake or with little trouble a change can be made to two horses.

Anderson County, S. C.

CAN THE FARMER AFFORD TO SELL HIS HAY AND STRAW.

CHAS. CHAPMAN.

PERHAPS the best argument against the selling of hay and straw can be found by looking at the land of the man who practices this method of farming. This is a convincing object lesson. I think all will admit that the selling of hay and straw without the return of an equivalent must in time reduce the soil to barrenness, just the same as the merchant's stock of goods is exhausted by selling all from the shelves and making no return. Every one knows that what is taken from the soil by the plant must be plant food, although the soil is not the only source of this article. Now this plant food has a market value and it is on this value the worth of the ingredients found in hay and straw depends. The manurial value of one ton of Timothy hay, based on the present price of the fertilizing ingredients here, would be about $5; of a ton of clover-hay, nearly $7; of oat-straw about $3.70, and wheat-straw, $3.70.

Now, the question is, can we ever put this amount of plant food back on the farm if it has ever been taken off? It is doubtful if most of us could afford to. It is much easier to keep a field productive as we go along than to bring it back to fertility after the soil has been exhausted. It has been well said that "a man's farm is his bank." In it he can make deposits subject to his draft for future crops. But if he overdraws his account he has to depend on the charity of his land and on Providence to give him paying returns.

Accepting all this as true, what is the remedy? Nature's way is to return to the soil as much as is taken therefrom. Is it impossible for us to do the same? I think not. The breeding and feeding of animals pay to a greater or less extent, the returns varying with the knowledge and experience of the farmer. Dairying, sheep-breeding and hog raising all pay a living profit if conducted in a business-like manner. All the above mentioned branches of farming consume the products of the farm, and return to it nearly all the plant food. This gives an increase of income, because the productive powers of the farm increase from this method, thus making the keeping of more stock practicable. The increase of income is the source of wealth, other things being equal. Although the selling of hay and straw may increase the income the first year, yet each succeeding year will show a decrease. Thus we can see that no farmer can afford to sell the hay and straw produced on his farm, and that the best use he can make of these is to convert them into butter, pork and mutton.

Schuyler County, N. Y.

ALSIKE CLOVER, AND HAY LOADERS

PROFESSOR A. J. COOK.

I HAVE only two points to argue, both of which I believe worthy of attention by our farmers.

First, I believe it pays well to mix Alsike clover with the Red in our spring seeding. The Alsike often catches when the Red does not. It is fertilized by the honey bees and so the first crop yields seed and re-seeds the ground; and so the Alsike becomes perennial, or at least continues longer than does the Red clover. I have practiced this somewhat, and shall do so more. The Alsike clover has the further advantage of being a valuable honey plant.

The other point is of more importance. I refer to the hay-loader. I purchased the Keystone two years ago, and I rank it with the mower. I would hardly know how to dispense with it. It is easily and quickly attached to the wagon as we enter the field, and last year we took all our hay without raking, just as it was left by the tedder. The loader not only took it clean, but carried it on to the load so rapidly that two men were required to keep it out of the way. Farmers have only to know the loader to appreciate it.

Ingham County, Mich.

GROWING MILLET.

COL. F. D. CURTIS.

ONE great advantage in growing millet is that it may be sown as late as the beginning of June in our Northern latitude, and be sure to mature before frost. This remark applies to the common millet. The coarse or broad-leaved millet, called German millet, requires from 10 days to two weeks longer to ripen. The common millet will ripen its seed within 100 days after being sown. In 90 days, or perhaps less, it will be sufficiently matured to be cut for hay. The ground should be well harrowed and made fine so that the seeds will germinate well and not be destroyed if lying under clods and lumps of earth. It is an excellent plan, if the land is not fine, to roll it before the seed is sown and then to cover it with a brush or light harrow, and roll it again. The seed should not be put in, in this way, if the ground is wet, and liable to pack or become crusted. The seed sends up a tiny shoot and it must not be obstructed in its growth, or the crop will be reduced. The seed will grow well if sown on top of the ground and left to be covered by a rain, and when a rain falls on it soon after it has been sown this is an excellent plan. If the seed is covered too deep there will be a great loss. A very little manure will give the crop a fine start, if it is put upon the surface. For these reasons commercial manures can be used to advantage. I sow this form of fertilizer broadcast, mixed with land plaster—equal bulks—at the rate of 100 to 300 pounds per acre, according to the quality of the land. A peck of seed is ample for an acre, if the land is well prepared; if not, more seed must be used. I have always sown the seed broadcast.

I have allowed the millet to ripen its seed and used it for chicken feed and ground it with oats for food for animals. The seed makes rich food; but it is unwise to grow millet in the way best adapted for this purpose as the forage will not then be nearly so valuable. I am sure that when the seed is allowed to ripen, the amount of digestible nutriment in the forage is reduced one-half. It makes very poor hay. When cut while the plant is coming into bloom, millet makes excellent hay which is good food for any kind of stock. Cows do well on it. It is nutritious and cattle are fond of it. Millet is a good crop for the silo.

I have cut it the last of September and cured it for the mow. It should be put into the cock as soon as it is dried a little, and if the weather is threatening, it may be cocked as soon as cut. It is better to have it wilted if possible before cocking. It is possible to gather a crop of clover and then put in millet on the same land and have it mature sufficiently for hay. A profitable change can be made with a run-out meadow, or pasture, by turning it over the first of June, or even up to the middle of that month, and growing a crop of millet. Millet may very properly, like flat turnips, be termed an appendix crop.

Saratoga County, N. Y.

FROM DIFFERENT STATES.

FROM CONNECTICUT.

THIS is not a hay country, and our farmers have not paid to their meadows the attention they should have bestowed. As a community we do not begin to produce enough hay for our own consumption, consequently tons and tons are brought here for sale. It is mostly Western hay, and much of it finds its way on farms that ought to furnish enough and to spare. Timothy and clover have formed the mixture generally used for seeding here, for years, and, as a rule, the farmers prefer to use it rather than try anything else. I prefer early-cut hay, because when the grass is cut before the seeds begin to form, I think the hay from it is most nutritious. At any rate the stock prefer it to that from grass which has been allowed to stand longer and become hard or "woody." I think that, as a general thing, hay is cut from two to four weeks earlier than it was a few years ago.

Haying here has not been on a scale large enough to allow the farmers to use all the improved tools. We have mowing machines and horse-rakes of all desired styles. Only a few tedders are in use. The larger barns are mostly fitted up with horse forks and hay carriers.

I don't think that, on an average, our meadows are seeded down oftener than every eighth or tenth year, and many of them are left unseeded longer than that. Rye is the principal crop with which we seed; but I think it is not so good as wheat. Very little wheat, however, is raised here; but I have always noticed that where we do seed with wheat we are sure of a good "catch" We seed in the fall; we have tried seeding with oats in the spring; but the attempt is not often successful. Some have successfully seeded with buckwheat, and some are sowing grass seed alone, with very satisfactory results. I think the latter plan, where the ground is in proper condition, is to be the plan of the future.

Our average yield is *not* over one ton per acre. Of course, there are meadows that yield two to three or more tons; but we have so many more that don't yield over half to three-quarters of a ton per acre, our average is very low. But little manure is used after a top-dressing at the time of seeding down. Most farmers try to give a fair top-dressing of barn-yard manure at seeding time, and this has generally to last till the sod is plowed for corn. Some of our more thrifty farmers and those who make the farm pay the best, often use leached wood ashes, ground bone, or some superphosphate on their grass land to good effect.

Few new grasses have been tried here, although Red-top is gaining in favor where it has been tried. Orchard grass has been tried with good results; but it is preferred for pasture rather than for hay, although, if cut very early, it is very good for the latter purpose. Hungarian and the millets have been tried only a little, but I think they have proved successful in most cases, both for hay and green feed.

Oats cut while green make very good hay when properly cured. This method of using the oat crop is also gaining in favor.

In my opinion the best way to increase the productiveness of our meadows, is to plow and re-seed them oftener, using manure liberally. Our meadows are allowed to run too long. No meadow should be permitted to exist that won't yield 1½ to two tons of hay per acre. If we are not in a position to plow it, it should receive a top-dressing to help it along. If we would care for our meadows properly and plow as stated, or often enough to keep the soil sufficiently rich, in a few years they would be yielding three or four tons per acre.

Darien. C. F. O.

FROM EASTERN WISCONSIN.

1. RED CLOVER and Timothy are the principal grasses grown in this section, with some Red-top and Alsike clover. We prefer early cutting, experience having shown that better results are obtained from feeding early-cut hay, especially in the dairy line. Such hay is eaten up clean, no dry buts being left. I think I can get 25 per cent. more milk from early than late-cut hay.

2. In this county very large quantities of hay are put up. Our tools are mowers, rakes, tedders and occasionally a hay loader to take the hay from the windrows and load it on the wagons.

3. We generally seed down every two years; that is, we leave a stand of clover and Timothy for two years. We seed down with nearly every crop grown—wheat, oats and barley—in spring. During the last two or three years, owing to poor stands from the effects of dry seasons, our farmers have turned their attention to seeding with winter grain, sowing Timothy in the fall with some grain and clover as soon as the snow is off in the spring, or even before. We always harrow after sowing grass or clover. We use a Cahoon broadcast sower, with which I can sow 30 acres a day.

4. Two tons per acre are considered a fair average yield at the first cutting, though ofttimes three are secured. During the past three years hay in Wisconsin has not averaged more than one ton per acre; but the yield in these dry seasons can not be considered an

(*Continued on Page* 335.)

Everywhere.

RURAL SPECIAL REPORTS.

Illinois.

PLEASANT VALLEY, Jo Daviess County, April 29.—Grain is so cheap here this spring that it is about as cheap to buy it as to raise it on land worth from $40 to $75 per acre. Corn, delivered, is only 25 cents; oats, 20; potatoes 20, and there is almost enough hay in stack to carry us through another winter. But though we have had some fine rains this spring, we have also a great deal of Northwest wind, which dries out the surface soil and the dry subsoil absorbs the moisture like a sponge, leaving the young grass insufficiently supplied, so we may need our old hay yet. Spring opened very early, some oats being sown in March; but it has progressed so slowly that now pastures are hardly any more advanced than they are in average seasons. Cut-worms threaten to be very destructive to early-planted corn. There's no organized resistance here to the twine trust; but I think there should be, and it's time farmers controlled the law-making power to a greater extent. W. S.

STERLING, Macoupin County, April 24.—We are having a nice spring. Peach trees are just coming into bloom. They have not had any bloom for several years. Fruit prospects are good if there are no late frosts.

J. H. W.

Indiana.

BRIGHTWOOD, Marion County, April 28.—Markets are dull: corn, 30 cents; hay, $15 per ton. Wheat is looking well. This is a fine spring for work. Corn ground is mostly broken and some corn has been planted. It's a little too dry for oats. Potatoes are planted, but they are coming up slowly, the ground being too cold. C. H. H.

Michigan.

BIG RAPIDS, Mecosta County, May 1.—There are several thousand bushels of potatoes in this vicinity and they are a drug in the market at 10 cents a bushel. Farmers are feeding all they can to their stock. T. L.

New Jersey.

TITUSVILLE, Mercer County, April 27.—The apple crop is very promising; blooms are full and the weather is fine. Pears will probably not be so good, although the bloom was abundant. The weather has been so cold and damp most of the time that a crop is doubtful. Peaches are in full bloom; if the low temperature does not hurt them when in bloom or just after, we may look for a crop; very uncertain now. I. J. B.

Oregon.

FOREST GROVE, Washington County, April 22.—The past winter was the mildest we have had for many years, if not the mildest ever experienced by the whites. There was no snow and very little cold weather. The prospects for abundant crops were never better. Winter wheat has made a very heavy growth. April for the most part has been rainy. Up to first of the month the season had been unusually dry, some land being too dry to work. A very large immigration is pouring into the country and a good amount of "booming" is being done. Lands that a few years ago were worth from $15 to $35 an acre, are now selling for $100 to $200. Many are coming from Michigan and other States to buy timber lands. We have a grand country which can support a vast population. The Pacific Northwest will be heard from in a few years. Prices rule low:—oats, 30 cents; wheat, 65 cents; potatoes, no market; eggs, 15 cents; hay, $8 to $10 per ton; butter, 20 cents. There is promise of an abundance of fruit. There never was a better prospect for strawberries and other small fruits. S. F. W.

Wisconsin.

DELAVAN, Walworth County, May 1.—I saw it stated that April was to be the wettest month—the rest of the season was to be dry. Is that prediction well-founded? Here March was very early and dry; April forward with seasonable showers. This morning the mercury is 28 degrees—rather frosty on the current, gooseberry, and wild plum, perhaps half of which are in bloom; but the weather is so dry that we hope no harm has been done as yet. Early cherry and apple blooms almost ready to open. We have the first promise of a cherry crop in three seasons. Apple trees promise a fine crop of bloom. This is the earliest spring I think in 10 years or more, and we have had the most lovely winter and spring so far. The sunny South can't beat this long spell of fine weather.

CHEMICAL FERTILIZERS FOR MEADOWS.

J. A. H., Kent County, Michigan.—We have heard a good deal about the use of chemical fertilizers in maintaining the fertility of our meadows and it may be that Western farmers will be obliged to use these fertilizers in connection with stable manure. Will the RURAL ask some of its Eastern farmer readers to tell us how the chemicals are most economically used?

Here are the answers sent by persons who "make farming pay":

FROM D. C. LEWIS.

Farmers in our vicinity believe that when they have applied chemical fertilizers liberally, on the potato crop more particularly, they secure a better catch, and get larger crops of grass from such liberal applications. The question of top-dressing grass lands is of more recent adoption. I have been doing it for some years, after the second mowing. This spring, top-dressing has been done more than usual, and in my judgment will continue to increase. I have been astonished at the increase in the hay crop by an application of only 200 pounds per acre. I am sure that in many instances it has doubled my yield of hay.

Middlesex County, N. J.

FROM JOS. WOOLWORTH.

Can newly seeded meadows be sustained for a series of years, or old grass lands be restored and made to produce large crops by the use of chemical fertilizers? I answer emphatically, yes. In support of the above I will give my experience in that line. I have about three acres of land seeded to Timothy after tobacco in the fall with no other crop, and the two following years I cut two very heavy crops each year, without any dressing whatever. After the second year I usually look for a falling off in the crop unless in some way sustained, and by the fourth or fifth year at the farthest, the land is ready for the plow again; but I have succeeded in keeping up the reputation of the two previous years by the application of about 300 pounds per acre of the Mapes Spring Top-dressing annually for five years, with a slight increase of fertilizers the last season. The grass the last season was not quite as tall apparently as it was the previous years, but it was thick and heavy and it is evident the time will come when it will be advisable to plow and re-seed, unless it can be done by sowing on grass seed, which I meant to do last fall or early this spring. I have again dressed the same field with about 400 pounds per acre this spring. This will be the eighth year since it was seeded without a spoonful of barnyard manure. I think I am within bounds when I say one dollar in fertilizers is as good as three dollars in barnyard manure, besides the extra cost of hauling and handling the manure.

I add a pailful of water to each sack of 200 pounds, which prevents it flying and makes it as agreeable to sow as oats.

Now a word about renewing old meadows: The same year in which I commenced the application of fertilizers to the above named meadow, I had another piece of meadow which had become badly run out and needed to be plowed or top-dressed. I plowed a part and left about one and one-half acre which was top-dressed with 300 pounds of top-dressing. The first year, the increase of crop was not particularly marked. The second year the crop was much better, and the third year it had about trebled in hight and was very thick and heavy with a strong mixture of Red and White clover. About the same dressing was applied for five years. The fifth year the crop was not quite as good and I inverted the sod last fall.

I am confident the best results can be obtained on newly seeded meadows, the roots being young and much more vigorous. Both the above plots lay on a much traveled road and the successive big crops have attracted much attention, with the frequent remark that we "take the cake" on the big hay crops of Westfield, followed by the question; "How do you do it?" The answer is invariably, "*by the use of* 300 *pounds of spring top-dressing annually.*" The question may be asked: "Why did you take up the 1½-acre plot when it was always doing so well?" I answer it had been down to grass many years and had become "turf-bound," as we call it, and though it was doing well it could be made to do much better by plowing and re-seeding, the same as all grass lands top-dressed with barn-yard manure for a series of years.

Westfield, Mass.

FROM WM. C. SMITH.

I can certify from actual experiment during the last 10 years, that the following method pursued for three or four consecutive years resulted in the production of remunerative crops, and the restoration of the land to grass: I sowed wheat and oats on several worn-out fields, drilling with the grain 400 to 500 pounds per acre of the Mapes Complete Manure "*A*" brand, at about the fourth or fifth crop, seeding with clover and Timothy after wheat. On other fields a top-dressing of 10 two-horse loads of yard or stable manure was plowed in and 350 pounds per acre of fertilizer used in the drill and planted with corn, in some instances for two years or more in succession. Where no top-dressing was applied, the same quantity of fertilizer per acre was sprinkled around the hills three or four inches from the stalks at the time of the last hoeing. On one or two fields 20 bushels of ashes were sown per acre previous to drilling in the grain and seeding. Five or six crops of grass have been mown from the above mentioned fields, and I anticipate that several more crops of hay can be profitably harvested. Wherever an indication of lessening growth appears, a light dressing of fine yard manure composted with fertilizer will restore it at once. The fields thus restored are a moist loam, very retentive of moisture. By the aid of chemical analysis, and the labor-saving implements of husbandry, agriculture can be classed among the exact sciences. The sagacious tiller of the soil is enabled to verify the assertion made long ago, that, "the desert shall rejoice and blossom as the rose." Our own loved poet in the last verse of his "Deserted Homestead" solved the problem when he said,

> "With skill that spares your toiling hands,
> And *chemic aid* that *science* brings,
> Reclaim the waste and out-worn lands,
> And reign thereon as Kings."

South Corinth, N. Y.

HOW TO MAKE A HAY PRESS.

F. M. R., Hamlet, Ga.—How can a hay press be made?

ANS.—A simple hay press can be made as follows: Frame together a stout foundation of 4x4-inch oak timber three feet wide and five feet long, frame in posts six feet long so as to make a space clear in the center three feet long by two wide, and frame caps on to these posts to hold the whole firmly. Make a floor to fill in this space; fill up the ends of the space with plank and the front and back with 2x4-inch timbers framed in the sills and caps upright, and cover with plank except in four places where openings are left from bottom to top for the wires or cords to tie the bales. A floor is made to fit the top loosely and the pressure may be made at the top if desired, either by a lever and cam, or post, and a ratchet and pawl at each end to hold the hay as the lever is shifted; or the top may be drawn down by means of a chain and a lever at each end and the ratchet and pawl; or the bottom may be loose and raised by a screw or lever. To press the hay, it is filled in and trampled firmly until the frame is filled to the top, the ties being laid across the floor and through the spaces left for them, as above mentioned. The upper ties are laid over the hay with the ends passed through the spaces, as with the lower ones. The cover is then fitted and the pressure is applied. When the hay is pressed to one-half of its bulk, making a bale 3x3x2 feet, the ties are fastened and the pressure is renewed. The bale is taken out of the press through a door consisting of one-half of the front part of the frame, which is made separately and hinged to the base. It is held in place by stout bolts at each side while the hay is being pressed. When this door is opened and let down, the bale is rolled out. With a press of this kind costing only $5 for the labor of making it, four bales an

hour have been made, each 250 pounds in weight.

SOILING DAIRY COWS.

H. R., Brookfield, Mass.—On page 87 of the RURAL we are told that Mr. H. P. Hopkins never pastures his cows. I would like to know how he manages to keep his cows in the barn all the time. I keep four cows and would like to keep them always up if it can be done with safety to their health.

ANSWERED BY HIRAM P. HOPKINS.

I feed my cows in the stable the year round, and in pleasant weather in summer I let them out in the barn-yard to exercise for about an hour. In winter I keep them in the stable, and do not let them out to get chilled, as I find I lose too much milk by doing so and it requires too much food to get them warm or in a condition to make milk again. My cows are as healthy and do as well (if not better) in the stable fed as I feed them, as the cows of any of my neighbors who drive their cows out every day in winter and pasture them in summer. I am now feeding silage, hay and grain, and shall continue to do so as long as my silage will last, which will be till about July 1st; then I shall have oats and peas to put in the silo, and I shall continue to feed as I am now feeding. Heretofore my first soiling crop has been rye sown at two sowings in the fall; next, clover; then oats and peas at a third sowing; then second-crop clover and corn. Corn is grown where I cut my first rye, and so on until I fill my silos. While I am feeding soiling crops I feed grain, as I find that it pays well. My herd is entirely made up of pure Jersey cows, which I have fed in this way for six years and they are regular breeders and as sound as any cows of their years. There has never been an abortion in my herd or a sick cow, caused by soiling or keeping them in the stable. I claim that I make more butter during the year from my cows fed in this way than other farmers make by pasturing and feeding as farmers generally feed.

"A NEW BARLEY."

W. H. L., Copenhagen, N. Y.—I inclose head of black barley for name. Two men here have about 200 bushels like this head, and are putting it out after the well-known fashion of the Bohemian oats swindle.

ANS.—The head inclosed is Nepaul barley which was illustrated and described in the RURAL of January 29, 1887. The variety is seldom grown except as a curiosity, it being very inferior in productiveness, and not thrashing cleanly from the head. Nepaul barley was first introduced to the civilized world in 1817 when it was brought from the Himalaya Mountains in the province of Nepaul, in Hindostan, and was known as Nepaul wheat. It has not been cultivated to any extent in Britain. The earliest record of its culture in America under that name was in 1859.

From a head of this variety planted at the New York Agricultural Experiment Station in 1885, four different varieties were grown, two black and two white. Of each of these two colors, one was bearded and one was bald. The seed is quite uneven in size, there being many small ones from the more feeble flowers. The grain is of medium size, rather plump and short, and deep amber or dark brown in color.

A correspondent in Michigan sowed a bushel on an acre of good land, and it made a poor growth and a miserable yield, being worthless, except as a curiosity. A Minnesota correspondent reported a heavy yield.

Grains of this variety were sent to the RURAL about a dozen years ago. As it was hulless, we supposed it to be some kind of wheat, and sowed it in the fall, and that was the last of it. It is safe to conclude that any grain boomed after the manner of the Bohemian oat plan is best let alone.

WHEN TO WATER HORSES.

D. L. B., Maplewood.—Is it right to fill a horse with cold water the first thing in the morning before feeding oats or meal? As watering the animal after feeding tends to wash the grain out of him, when should he be watered?

ANSWERED BY DR. F. L. KILBORNE.

It is not desirable to "fill a horse with cold water" at any time. Horses should get water frequently and then they will rarely drink more than one bucketful. In fact, a horse should rarely be given more than the one bucketful to drink at one time. As to watering just before or just after feeding, there is little choice. The preference, however, is to be given to watering before, as less liable to produce unpleasant results. When given a considerable quantity of water immediately after a feed, especially one of grain, it is liable to wash the grain from the stomach to the intestines before it has been digested, and cause indigestion and colic. If convenient to do so, it is well to water the horse an hour before or after feeding; or if watered immediately before, feed only hay or other coarse fodder at first, and the grain a half hour or more later. An excellent plan is to keep a bucket of water always before the horse in the stable, to be refilled three times daily or oftener if necessary. The animal will drink only a few swallows at frequent intervals and there is then no danger of any injurious effects from drinking too much.

GERMAN MILLET SEED AS STOCK FEED.

W. A., Dorchester, Neb.—There is a vast amount of German millet seed on hand in this section, for which there is no sale. We are told it is good feed for hogs. If so, how should it be fed?

ANS.—The seed of German millet contains more nutriment than barley or buckwheat and approaches very nearly to corn in feeding value, as the following figures will show.

Per cent. of	Compositon of Millet.	Buckwheat.	Barley.	Corn.
Nitrogenous matter....	14.5	9.0	9.5	10.0
Carbo-hydrates, ...	62.1	59.6	66.6	68.0
Fat.....	3.0	2.5	2.5	7.0

Millet excels all in its nitrogenous matter, gluten, albumen, etc., and as this substance is worth as much as fat for feeding, corn only slightly excels it in value. On account of its excess of nitrogenous substances, it may be fed alone to all kinds of stock without any ill effect, as its feeding ratio is a normal one, viz., 1 to 5.25 (1 of nitrogenous to 5¼ of carbonaceous.) For fattening animals it may be very usefully fed with corn which contains an excess of carbonaceous matters. The best use of the millet seed will therefore be to feed it as suggested. It may be fed whole or coarsely ground into meal. The large yield of this nutritious grain—25 bushels per acre—renders millet a very valuable crop, and, as when cut before grain is formed, the nutritive quality remains in the hay, its growth for feeding in either way is a subject of timely consideration just now.

ANASARCOUS SWELLING IN A HORSE; LEUCORRHŒA IN A MARE.

Subscriber.—1. One evening, I noticed that my mare was very stiff in front and next morning she was much worse. There was a swelling between the fore legs and a lump on each side of the body just back of the girth, and one on each side of the breast. The swellings are very hard and sore. I have bathed the parts with very hot water and vinegar and rubbed them with lard and pokeweed, with no effect. In other respects the animal is all right. What should be done? 2. A mare of mine dropped a colt 10 years ago. She got the stallion again four years afterwards, but didn't get with foal. Since then she has had the stallion for five years but in vain. The seed is full of green matter. She discharged from the vagina a very thin pale white fluid of a very offensive odor all through the winter. What should be done?

ANS. 1. Give one of the following powders three times daily until the swellings go down; chlorate of potash four ounces, iodide of potash twelve drams, nitrate of potash three ounces, mix. Make into twelve powders. If the bowels are at all costive, give frequent injections of warm Castile soap-suds until relieved. 2. Wash out once daily with tepid water, and then inject one dram each of sulphate of zinc and carbolic acid dissolved in one pint of water. The mare will probably not breed again.

BLOODY TUMORS ON A COLT.

P. P., Rich Hill, Mo.—My two-year-old filly has one lump on her neck and another on her back. At first I thought they were warts, but they are not. The one on her neck is now as large as a small egg. They are blood-and-watery all the time, and get larger when she rubs herself. What will take them off?

ANS.—To remove the tumors, tie a strong linen twine tightly around the neck of each, making sure that the whole of the diseased mass is included outside of the twine. If necessary get an assistant to draw the tumor out so as to form a neck around which you can make the ligature. Apply a new ligature around the tumor daily; make it tight each time. You will find the neck will grow smaller each day until the twine will have entirely severed the tumor from the body. After the tumors are removed, if there remains a sore which looks unhealthy and does not heal readily, ask a veterinary surgeon or your family physician to cauterize the sore thoroughly with a stick of nitrate of silver or lunar caustic. Then dress it with benzoated oxide of zinc ointment. If the colt rubs or bites the sores you must keep them covered, until healed, with a piece of canvas or blanket fastened to a halter, collar and surcingle so as to keep it in position.

GROWTH OF BONES OF THE LIMBS IN COLTS.

P. H. P., Pope Valley, Cal.—Do the bones of a colt's legs grow in length after it is foaled? 2. If so, at about what age do they cease to grow in length? I am fully aware a colt's legs do not grow any in length from the knee down after birth. But from the knee up I contend they do.

ANSWERED BY DR. F. L. KILBORNE.

1. Yes. 2. If P. H. P. had ever taken the trouble to measure the length of the legs of a colt when foaled and again when he is two years of age, he would never have asked the above questions. If he will even stop to compare the limbs of any colt with those of its mother, he will be surprised to learn how unobserving he has been all his life. The limbs of colts grow in length both above and below the knee for two to four years, until the animals have attained their full hight. At birth, the long bones of the limbs have a center of ossification—region of bone formation—at each end and in the center, between which there is a region of cartilage. Growth in length takes place in this cartilage and continues until the whole has been ossified, or formed into bone, which process is not completed until the animal has attained his full hight. After the cartilage has become bony, growth in length ceases.

FEED AND CARE OF BROOD MARE.

J. M. W., Eugene City, Oregon.—A mare of mine dropped her first foal all right, but the second one died when two days old, having never been able to stand up unsupported. It acted as if there were no strength in its back. The mother raised two strong foals. Last spring she lost another foal in the same way as the first that died. She will foal again soon. Last year I turned her to pasture two months before she foaled and was careful not to work her hard before she was turned out. What should be done to prevent another mishap?

ANS.—The strength of the foal depends largely upon the feed and care received by the mare during gestation. We can only advise you to give special attention to these points. See that the mare has good nutritious food in moderate quantity, but do not over-feed. There is more danger in over-feeding than not feeding enough. All feed and drinking water should be of good quality. Thorough daily grooming is very desirable. Light work or other exercise daily is essential.

GREEN AND YELLOW NEWTOWN PIPPIN APPLES.

W. P., Aukland, New Zealand.—Are the Green and Yellow Newtown apples identical? A friend says that some years ago he sent to Ellwanger & Barry, nurserymen in the United States, for two specimens each of the Green and Yellow Newtown Pippins, and that they sent him the Yellow only, saying that they couldn't find any Greens in the United States. Downing says the two varieties are quite distinct, but our local pomological genius is of the opposite opinion.

ANSWERED BY ELLWANGER & BARRY.

The question as to whether there are two distinct varieties of Newtown Pippin, the Green and the Yellow, has never been satisfactorily settled. It is true that Downing and other pomologists describe them as distinct, but in all our experience we have not been able to find them. It is held by many that the differences supposed to exist between the two sorts are the results of soil and situation.

SORE FEET IN YOUNG PIGS.

Z. C. S., Jersey Shore, Pa.—My two-year-old Poland-China sow dropped eight pigs two weeks ago. About a week ago all the little things became lame, and some lost half a foot, while all the feet were swollen and sore. The sow was very fat, and the pigs got sweet milk, wheat bran and were fat and sleek. What was the trouble?

ANS.—The condition of the feet and limbs of the pigs is evidently due to high feeding. Bathe with borax water or vinegar and honey. Breeding stock should not be kept too fat if you would secure the best results. Far more trouble is caused by over-feeding than by not feeding enough.

PLANTING CORN.

G. B. H., Lansing, Mich. In its Corn Special did the RURAL mean that, to produce the best yield, the rows of corn should be four feet apart and that the hills should be 18 inches apart in the rows and have two or more or one stalk each?

ANS.—Our corn is invariably planted in drills. Our Chester County Mammoth, which we have raised consecutively for many years, is a very tall-growing variety, with large stalks, each bearing its large ear high. Now we aim to plant this in drills four feet apart; that is, one plant every four feet by 14 inches or thereabouts.

Miscellaneous.

G. B., North Ogden, Utah, sends some seedling apples for an opinion of their merits.

ANS.—These apples were so injured from the bruises consequent upon loose packing that we could not judge of their quality fairly. They are evidently long keepers.

J. L. S., Westfield, Mass.—When potatoes are planted in drills in rich soil, how should the "seed" be cut to yield the largest returns per acre?

ANS.—We should cut the potatoes to two strong eyes at least, giving the pieces all the flesh possible.

W. W. D., Flint Hill, Vt.—At what distance apart should corn be planted on land that has been meadow for 10 to 12 years? It is flat, between two hills, and rather moist.

ANS.—Our friend does not mention the variety. On springy or wet land, probably it is best to plant in hills and cultivate both ways. If the Southern dent corn is to be planted, two or three plants to a hill three feet by four would be about right.

V. A. T., Chili, N. Y.—I have a rather poor, sandy soil and but little barn-yard manure. I wish to plant six acres of sod land with potatoes. Should I plant in hills or drills, and what fertilizer should I use?

ANS.—We should buy a high-grade potato fertilizer. If you propose to use but a small quantity, say 500 pounds to the acre, it had better be sown in the hill or drill; if 1,000 pounds or more are to be used we should sow it broadcast and harrow it in. We know of no other publication which has given more information on this subject than the R. N.-Y.

H. T. L., (One of the 19 Brightons in the country)? 1. Would bones burnt and mashed to a powder be a good fertilizer for cauliflower and cabbage? 2. What chemicals do burnt bones contain? 3. Would well rotted manure from corn-fed pigs be as good as burnt bones or better? 4. Could I procure a dent corn that would mature here? Our season is generally from May 24th until September 24th without frost. What about Hickory King?

ANS.—If your soil is supplied with available potash and nitrogen, yes; otherwise, no. 2. Phosphoric acid and lime. 3. Better. 4. Yes, the Prairie Queen (Yellow dent) will mature. It is also known as Pride of the North. The name of correspondents' States should always be given.

T. W., Dennville, N. J.—1. I have a lot of clear hen manure and want to raise 100 bushels of corn per acre by hill culture. Would a liberal quantity of the manure in contact with the sprouting grain injure it? How should it be applied? 2. Would it be advisable to mix the hen manure with well-rotted manure from cattle and horses?

ANS.—1. We do not believe you will raise that quantity of corn from hill-manuring unless the soil is rich. Manure in the hill is first-rate for the young plant, but later, when the grain begins to form, the roots extend from hill to hill and from row to row. The hen manure should be intimately mixed with the soil of the hill. A pint to the hill will then do no harm to the sprouting seed. 2. The hen manure and farm manure may be mixed together or each may be spread separately as preferred.

F. K. P., Delavan, Wis.—Is it tedious and expensive to keep out or clear out of ponds the grass, weeds and frog spittle that usually infest them? What tools are necessary to do so? [We submit this inquiry to our readers for an answer.—EDS.]

DISCUSSION.

PEA-VINE HAY, OR COW-PEA HAY.

G. H. T., DENMARK, MISS.—We have several varieties of cow peas especially adapted for table use. Of these the Lady pea, Sugar Crowder, Small Crowder, and Rice pea are the favorites here. The common Black, Red Ripper, Yellow Creeper—so called because, unlike all the other varieties, it *will not* run up on the corn—(and a great many more varieties that I have not time or space to name) have long vines, especially the Sugar Crowder and Black pea. The Conch pea is not known here, except from advertisements. All the above make equally good hay, but in this section the Speckled or Whip-poor-will pea is raised (for curing into hay) almost

Miscellaneous Advertising.

"Herbrand" Fifth Wheel for Buggies.

exclusively. It is deservedly popular. It is strictly a bunch pea, which is quite an advantage at harvest time, as the vines do not intertwine and become tangled, as all the running varieties certainly do. It is likewise the earliest variety, so that it is adapted to a much wider territory than any of the others. It can be raised farther north than any other cow-pea and its earliness adapts it to be planted as a second crop, following oats. Oats are harvested here in June. As soon as they are dry they are hauled to the barn, and as soon thereafter as convenient the stubble is laid off and bedded in rows three feet apart; the beds are opened with a shovel plow; peas are dropped four to six in a place; 18 to 24 inches apart in the drill, and covered with a harrow. Planted in this way, and with one plowing after they are in full leaf, (if planted by July 1, in this latitude) they will mature a full crop of ripe peas before frost. In regard to "when to cut," those who have written on this subject say, "Cut when the first pods that appear are about full-grown, but still green." As far as my own opinion is concerned, I would certainly save my seed first, before cutting them for hay. To do this they would necessarily have to be fully ripe. My reasons for waiting until then are two-fold:—first, for economy's sake, as I would not wish to purchase seed every year; secondly, when they are cut while full of sap and covered with a large number of green and very succulent pods, the weather would have to be extremely favorable to enable one to save them, if they could be saved at all, as it is necessary that they should be cured in the shade; for if they were cured in the sun, the leaves would all crumble and tumble off before the stems and pods were dry. My own practice (and it is likewise that of the farmers of this section generally) is to wait until the peas are ripe, but not dead; gather as many as we want for seed, feed, and sale; then save the vines; when they are gathered at this stage there is not much sap in them and as a natural result they are easily cured.

Are they as nutritious and as easily digested when cut at this stage as they would be were they cut green—by green I mean immature? To this I would answer I have a large amount of well cured pea-vine hay with from 20 to 30 bushels of dry peas thrown in, and as to their digestibility, cattle, sheep and horses will eat every morsel even to the roots (if they have been pulled up, and they often are). Moreover, they will thrive upon the feed, and would winter well upon it exclusively. I believe this kind of cow-pea hay is the best and strongest fodder saved in the South.

As to curing, there are several plans in vogue. The one generally practiced in this section is to pile the vines in rail pens (raised a foot or more from the ground) with the floor as open as the sides to allow a free circulation of air. Fill in to a depth of 18 inches or two feet, then lay some nicely dressed poles across, filling in again with vines; then more poles, and more vines alternately till the pen is filled as high as required; then cover it with a good roof. I said "nicely dressed poles" because when smooth they may be drawn out as the vines cure, letting the latter down, thereby economizing space, and putting more under one roof. Another plan is to hang the vines as fast as cut, on poles, under a good shelter. Still another is to trim up saplings with the limbs projecting, say, three to six feet at the bottom, tapering in a pyramidal form to the top; put an open floor at the base of the saplings (which should be firmly fixed by letting the ends into the ground 18 inches or more)—even brush will answer as a floor; then stack the green vines on the limbs and floor, around the saplings. The limbs will keep them sufficiently apart to allow a free circulation of air, which is absolutely essential to cure them successfully. A plan I have practiced successfully, and one I am partial to, is to place a layer of vines on the floor of an out-building to a depth of two or three feet—fodder or hay lofts answer a good purpose—letting them stay there till cured, always recollecting that the floor must be an open one. Other plans could be followed or suggested, but the *general* principles may be summed up in few words: Never cut or house the vines when they are wet with either rain or dew. Always let them wilt in the field, but never let them stay there until they are dry. Keep in mind that with a good roof over them, and a free circulation of air among them, you can hardly fail to succeed in curing pea-vine hay, always providing the weather be moderately dry.

Those who have no place to put them should cure them as soon as they are a little wilted, by putting them in small, high but narrow shocks. These should be very carefully made, pressed on the sides so as not to spread out, and rounded and dressed off at the top to shed rain. Let the vines remain in these shocks till they are about half cured; then make one larger shock out of several of the smaller ones, building them up in like manner. Let the vines remain in these till well cured; then house. Another plan is to rake up a portion of the vines, and roll them over and over the others until a good-sized, compact cylinder is gathered; these can be readily handled and set on end under shelter to cure. Whatever plan is pursued, always bear in mind the above general principles.

USE OF THE HARROW IN CULTIVATING CROPS.

A. T. T., FRANKLIN PARK, N. J.—In reading the variety of opinions expressed in the RURAL of April 27th under "Cultivating Young Crops," "Harrows as Hoes," let no man allow his heart to die within him or be stimulated to undue hilariousness on account of the assertions made. He may rest assured that if his soil be light and sandy, the harrow will work him sorrow and tribulation; but if, on the contrary, it be heavy and inclined to clay, the harrow will not only help in fitting the soil, but will aid immensely in hurrying on the work and in saving time. For years I have run a smoothing harrow of 72 teeth over corn-fields, and the proportion of stalks torn up was simply infinitesimal. On drilled fodder corn or on field corn that had been drilled in, the harrow in crossing the rows most effectively and satisfactorily yanked out the youthful weeds, leaving the corn unharmed, and, to all intents and purposes, untouched. The whole secret of this apparent partiality in the harrow to the destruction of weeds and the saving of corn lay in the fact that the soil was heavy and compact enough about the corn roots to hold them fast. Of course, the roots of the corn were much larger than those of the weeds, and during the first harrowing they probably still clung to the original kernels that were deposited as seeds, thereby offering much greater resistance to being displaced or drawn out of the ground than the young weed roots could do. Besides, the corn sprouts started from under a considerable depth of soil, while the weeds started from the surface or would have done so if the ground were properly cultivated at the start by the sod being entirely inverted. Convinced of the utility of the harrow at the outset, I became, in an unguarded moment, enthusiastic enough to communicate the good news to a friend who was accustomed to planting largely and also accustomed to mourning grievously over the burdensome expense which the price of labor necessarily entailed upon him in cultivating this large crop. Without inquiring about the quality of his soil, I gave him the details of the "method of procedure," and he at once provided himself with the necessary implements. Fortunately, he had passed beyond a maximum state of indignation and had nearly reached his normal condition of good nature before I saw him next. He was, however, still eloquent in his denunciation of harrows, slanting, straight or of any other form, for corn. He stated that he had ordered his man, in accordance with my instructions, to run as nearly at right angles to the rows as practicable, and the man had done so. After going across the field a number of times, the destruction of corn apparently increasing at every bout, the man came to the conclusion that the rule to "obey orders if you break owners" would be better observed in the breach than in the practice.

A boy was therefore despatched for his employer. On reaching the field and looking over the destruction of the corn that had gone on in his absence, my friend said his opinion regarding the plan of harrowing corn was at once expressed in very emphatic language. He told his man to pitch the harrow over the nearest fence, and at once fell back on his old method, concluding it was better to lose his labor than to lose labor and crop both. His soil was a light sandy loam with an abundance of small cobbles and large pebbles. There was nothing compact or weighty enough around the young corn roots, to hold them down, so they bowed their heads meekly and were scratched out quickly as the harrow passed along.

UTILIZING STRAW.

K. M. T., QUINCY, ILL.—An article appeared in the RURAL, some time ago, in regard to the burning of straw, and in the issue of April 27th, I note that J. A., Vincennes, Ind., rather favors the idea. My mode of taking care of the straw may assist some of my brother wheat raisers in different localities to care for their straw and at the same time reap more benefit than is to be derived from burning it. When our stacking is being done I get a thrasherman who has a "stacker" with his thrashing outfit. With the assistance of this stacker two men at a cost of $3 per day will take care of all the straw a machine can thrash, which is probably on an average 15 tons per day. As soon as our fall work is slack, my men bale the straw. With some presses three men and a boy can bale eight tons of straw a day, thus baling the day's thrashing in—to make even figures—two days, which makes the total cost of stacking, and baling 15 tons of straw $7.50, not including the labor of my team. The expenses may be itemized as follows:—Two men one day stacking straw, $3; three men baling at $20 per month, two days, $4; one boy two days at 25 cents per day, 50 cents—$7.50. I now have my straw baled and can place what I want for barn use in a very small place where I can get it handy, and the remainder I haul to the railroad and ship to the paper mills, from 50 to 150 miles away, and I hardly think there can be any good wheat-growing districts where paper mills are located at a greater distance. They pay me $5.50 to $6.50 per ton for my straw at the mill. Now let's see what I get for these 15 tons of straw. It cost me 50 cents per ton to haul it to the cars and load it; $1 per ton freight, total $22.50, *plus* the cost of baling, a total expense from the thrasher to the paper mill door, of just $30. I receive from the mill never lower than $5 50 per ton—$82.50, less expenses, $30, which gives me $52.50 for my straw, interest on the money invested in my baler (a portable horse-power) and my work which probably does not exceed two days' time.

If one does not want to buy a baler to take care of his straw, let him hire one for a week or 10 days at 35 cents per ton. I feel sure if some who now burn their straw will try the above method, they will not feel like burning straw any more than they would green-backs.

What Others Say.

A MASSACHUSETTS CORRESPONDENT of the Country Gentleman writing of sweet-corn silage, states that after a trial of two years he is so well satisfied with it that he will plant no other kind this year. The past season he put in one acre of it. When cut into the silo, nearly every stalk had one or two well-matured ears. It made a solid section three feet in depth across the silo, with several feet of other corn above and below it. It kept equally well with the other. When he came to feed from this section the flow of milk at once increased on a diminished ration of meal, and it kept up till he struck the poorer corn. He intends to plant Marblehead Mammoth this season, which is a week or 10 days earlier than Stowell's or Egyptian, and, on good land, will grow seven feet high, and produce two large ears to every stalk

SILOS AND SILAGE.—The Michigan Agricultural College has had seven years' experience with ensilage and the result is given by Prof. Johnson in a bulletin lately issued. He has endeavored to be temperate and conservative in his claims for the silo and not to jump at conclusions; for he fully believes that the half-digested statements of many enthusiasts, without practical knowledge, have been as much of a hindrance to the introduction of the silo, as the persistent opposition of some scientists, who have ignored practical results because they did not conform to their preconceived theories.

As a matter of convenience and economy in handling the silage, the silo should be as near the feeding room or stable as possible, and on the same level. It may often be economically located in the bay of the barn, or in some adjacent building. The carting of the silage from the silo to other buildings is not only expensive, but there is more or less waste from the exposure.

To determine the size of the silo, estimate as a daily ration for each animal to be fed about six per cent. of its live weight. This amount of good corn silage, with a few pounds of wheat bran, oats, oil-meal or clover hay will keep animals in fine condition, and also will be found a good milk ration. Take this estimate, to illustrate: ten cows, weighing 1,000 pounds each, will consume 600 pounds of silage daily, or 18,000 pounds per month, or 108,000 pounds in six months.

Professor Johnson has found by actual weighing that a cubic foot of silage, two feet from the surface of the silo, under moderate pressure, weighs 36 pounds; eight feet below, 48 pounds; 10 feet below, 50 pounds. It is safe to estimate about 40 pounds as the average weight of a cubic foot.

We must also make calculations for the settling, in our estimates. If well packed this will be found one-sixth to one-eighth of the depth of the silage; 108,000 pounds would require 2,709 cubic feet of space; add one-sixth for settling, and we have 3,150 cubic feet. A silo 22 feet deep, 10 feet wide and 14 feet long will give this capacity.

How can the same storage capacity be secured so cheaply as in this small silo? And when we add that these 54 tons of silage are sufficient almost to keep, with a grain ration, the 10 cows six months, and may be grown from three acres of good land, it opens up and emphasizes the possibilities of the silo as one of the main reliances of the stock-man in these times of low prices.

It is better to build too large, than too small; have good hight, avoid the deep silos or caverns from which the silage must be raised by machinery.

With a large silo Professor Johnson prefers a partition; it is often more convenient in filling, especially if different crops are to be grown for this purpose. In feeding, so large a surface is not exposed, and consequently there is less liability of injury and waste.

Estimating three tons of silage equal to one of good hay, has been found in actual feeding a fair comparison.

While very large yields per acre of ensilage corn are frequently reported, an experience of some years leads him to infer that these large yields are based on estimates rather than actual weighings. Professor Johnson is of the opinion that 20 tons to the acre are an exceptionally large yield. He has had some very good crops but has never exceeded that weight per acre. From the 10th to the 20th of May is the best time for planting in Michigan.

The practice among those most successful with the silo, is to cut when the grain is beginning to glaze.

Professor Goessman says that the amount of vegetable matter in a given weight of green fodder corn, cut at the beginning of the glazing of the kernels, is known to be not only nearly twice as large, as compared with that contained in an equal weight of green fodder corn when just showing the tassels; but it is also known to be, pound for pound, more nutritious; for it contains more starch, more sugar, more of valuable nitrogenous matter, etc. Professor Johnson has put corn into the silo when the stalks were partially dry and sometimes after they had been frosted, and while he cannot doubt that there was some loss in nutrition, the silage was fairly good and he is confident the corn so injured could in no other way have been as cheaply and economically stored for winter use.

TRUE INWARDNESS.

A WRITER in the Kansas Farmer says: "I am at this time paying the First National Bank of Peabody 18 per cent. on borrowed money, and during a portion of the year have paid 24 per cent. on a part of the same money. The town of Peabody, with 2,000 inhabitants, has four banks; Walton, with less than 300 souls, has one, and Newton, with a population of, say, 8,000 has six with the seventh nearly ready for usurious occupancy."

COMMENTING upon the above the O. C. Farmer says that it seems to be high time that Kansas had a law limiting the rate of interest and not only Kansas, but all Western States where the matter is not now restricted within reasonable limits.

These Shylocks are slowly but surely eating up the substance of the people. They are an ulcer on the body politic. "They toil not, neither do they spin," but they live on the sweat of other men's brows and wax fat.....

OUR interesting contemporary above quoted mentions that not long since some boys were torturing a dog in the street, when a young lady passing along interceded for the dog and persuaded them to desist from their cruelty. She walked away, satisfied that she had done a humane act—and so she had. But on her hat were a beautiful specimen of a stuffed humming bird and a pair of wings from some other bird, both of which had been killed in order that her hat might be adorned to suit her fastidious taste.....

OUR respected friend Dr. W. J. Beal of the Michigan Agricultural College, says that for the past 10 years or more the lumber cut in Michigan has been steadily on the increase, and during this time the great waste has been without a parallel in the history of nations. In the southern counties of the State, people are already beginning to be more careful about wasting the timber. Of the three greatest interests of our country, manufacturing of all kinds ranks first, agriculture second, and forestry third.....

CONGRESS has appropriated large amounts for investigating and encouraging the growing of oysters, crabs, lobsters and fish and the money already appears to be giving large returns. Michigan for some years has done a little by way of experiment to foster the production of fish in our lakes, ponds and streams. We legislate to protect birds and wild game and appropriate money to encourage a large number of worthy objects, but for our forests, from which we are drawing a larger amount in natural wealth than from any other source of supply, or from all other sources together, we have so far done practically nothing to protect or cultivate.....

THE evidence, says Dr. E. J. James, is ample and conclusive that we are making fearful inroads on our forest stores. We are cutting off a much larger crop then can possibly be replaced by natural growth within the period when, at the present rate, we shall have cleared the original forests off the ground. We are wasting our forests by the ax, by fire, by pasturage, by neglect. So far as timber is concerned, we are eating into our capital with little care for the future.....

A RECENT BULLETIN of the New Jersey Agricultural Experiment Station summarizes the results of certain experiments made by the Station, and by certain individuals with the object of finding out what the land needs. The Rev. H. P. Thompson, of Readington, on one-tenth acre plots, used phosphoric acid, potash and nitrogen separately and in combination, with this result:

Fertilizer.	Cost.	Net profit.	Per cent. on money invested.
Nitrogen, phosphoric acid and potash.....	$14.95	$4.19	28.
Phosphoric acid and potash.	9.00	15.50	172.
Phosphoric acid.....	5.25	10 15	193.
Potash.....	3.75	13.65	364.

The returns on the money invested ranged from 28 per cent. to 364 per cent. Mr. Thompson has continued the use of potash upon corn, and has secured uniformly profitable returns up to the present time. His experience also shows that kainit, while it costs more per pound of actual potash than muriate of potash, has been the more economical.

CERTAIN QUESTIONS were asked by Director Cook of a number of New Jersey farmers. Answers were received from 23, representing 10 counties; of these 17, representing nine counties, reported the profitable and continued use of either muriate of potash, kainit or unleached wood ashes as a fertilizer for potatoes, corn, grass and fruit. Twelve farmers, representing eight counties, favored the use of muriate of potash, while five, having used both muriate and kainit, were satisfied that kainit gave the largest returns for the money invested. The weight used per acre ranged, for corn, from 50 to 200 pounds of muriate, and from 300 to 500 pounds of kainit; and for potatoes, from 150 to 400 pounds of muriate, and from 300 to 800 pounds of kainit. The crops reported as being especially benefited were corn, potatoes, fruit, clover and oats. Without exception, the use of potash, either alone or as an adjunct to farm manures, was regarded as highly satisfactory and economical.....

THESE RESULTS, gained from experiment, and confirmed by practice, while only positive for the farms and crops represented, should have a significance for those farmers who have not tested their soils, because they not only demonstrate that soils differing widely, both in formation and previous treatment, respond profitably to applications of potash alone, but also indicate a general lack of potash in the soils of the State, and consequently point out the importance of soil tests by the farmers themselves; for when maximum crops can be secured by the application of potash alone, it is poor economy to apply complete fertilizers, costing $40 per ton, in which $5 represent the value of the potash...

THE R. N.-Y., as its readers know full well, has found that potash alone, no matter what the form, has little if any effect on its poor-soil experiment plots. Neither has nitrogen alone nor phosphate alone. Neither has any two. Only complete fertilizers pay. Thus we see that what is profitable on one field is profitless on another, and the question is one to be answered by every farmer for himself..

PROF. E. M. SHELTON, from careful tests made at the Kansas Agricultural College, says that farm-yard manures must be hauled to the field in the spring; otherwise the loss of manure is sure to be very great, the waste in the course of six months amounting to fully one-half the gross manure and nearly 40 per cent. of the nitrogen which it contained.....

PROF. SHELTON found that corn from which the tassels were removed as soon as they appeared, yielded less than that allowed to mature its tassels. He also found, as has the R. N.-Y., that corn from which the "suckers," were removed, yielded less grain than that allowed to grow naturally. He concludes that all such manipulation is worse than a waste of time.....

FROM all the facts, Prof. Shelton says the listing of corn seems well worth the careful study of his Station. The method itself, like most agricultural operations, is far from being a simple one. As compared with the old methods, it presents the following points of difference: Listed co n is planted at the bottom of a deep furrow, and in otherwise unplowed land; the corn is drilled, perhaps less, or more thickly than in surface planting.

LAST YEAR a number of plots were listed and a corresponding number treated in the usual way. The listed corn yielded over 46 bushels to the acre, the drilled corn about 40 bushels .....

PROF. SHELTON mentions the Tower Surface cultivator which is an implement the R. N.-Y. would like to know more about. This machine is made on the general plan of the familiar two-horse walking cultivator. It differs from the ordinary implement in that each cultivator consists of a gang of sharp knives acting horizontally and set at an angle with the direction of the line of draft. It acts superficially, as its name indicates, slicing the ground very thoroughly to the depth of one or two inches, as may be desired.

THE KANSAS STATION made a number of trials to find out how much cultivation it is profitable to give corn.

The plots "slightly" cultivated yielded at the rate of 38 bushels of sound corn; those receiving "ordinary" cultivation yielded 48; those which received very shallow or surface cultivation, yielded 45 and those which were "excessively" cultivated yielded 42 bushels.

PROF. SHELTON finds that the largest yield, of the best quality of corn, goes with the plants cut latest. Corn continues to improve in weight until the very last—after the blades of the plant have been dried up, and quite likely blown away, and seemingly until the juices of the stalks have been completely sucked up.....

NO EXPERIENCED FARMER will suppose for an instant that this improvement in the quality of the fodder obtained in the early cuttings nearly compensates for the great loss sustained, both in quantity and quality, of the yield of grain. Considering all the facts—the great labor of husking corn from the shock as compared with "picking" it from the standing stalks, the great difficulty in tying, hauling and stacking or otherwise securing the fodder crop, and the great waste of fodder in the field and ultimate loss in feeding—it is perfectly clear to Prof. Shelton that Kansas farmers must raise corn for corn, with no thought of fodder, and corn again which has no higher purpose than the production of fodder. They must, in short, have two corn fields on every farm, receiving radically different treatment, to correspond with the different purposes for which they are cultivated.

THE WEAK POINT in the practice of Kansas farmers is the all but universal neglect of corn as a hay plant. It is far from Prof. Shelton's purpose to write in belittlement of the efforts so many Kansas farmers are putting forth to secure grasses and clovers suited to their climate, but certainly the men who deplore the lack of tame grasses in Kansas forget that, so far as hay is concerned, they have in Indian corn and sorghum hay plants which are superior for most of the purposes for which hay is used to any of the so-called tame grasses in certainty of yield, quality and quantity of crop in handling, if properly handled.....

WITH the object of learning the effect of moderately grazing wheat, both in fall and spring, a portion of a field was selected for the purpose of trial. There was only this noticeable difference—and this was slight—between the grazed and ungrazed areas: the former, particularly that used for fall pasturage, bore a considerably more leafy straw, as indicated in the table, and it seemed a little slower in ripening, although the time of cutting the three areas was the same.....

THE application of manure to certain plots of the Kansas Experiment Station did not pay at all. It is notable that the application of salt did pay.....

THE report respecting Teosinte is essentially that which the R. N.-Y. made 10 years ago.....

PROF. SHELTON says that the Rural Branching sorghum was last year the most satisfactory variety grown. The exceedingly interesting and instructive report which we are now quoting from—a report which reflects much credit upon the Station—makes no mention of having cut the Rural Branching sorghum back to ascertain what its second growth would be.....

THE DIRECTOR has no kind words to speak of Kaffir corn. He says that it has been tried for two years. It grows quite surely and yields more seed per acre than the other varieties of sorghum. The forage has not proved valuable for feeding, and it is doubtful if this variety is equal in value to either Rural Branching sorghum or African millet.....

KAFFIR CORN, it will be seen, behaves in Kansas much as it does at the Rural Grounds.

DR. LEARNED charges 30 cents a pound for his hygienic hams; 25 cents for hygienic sausages and 25 cents for hygienic lard. He is the pioneer in treating hogs in reasonable accordance with the laws of hygiene and finds many who are willing to pay the above high prices for sound, healthy pig products.....

FARM AND HOME says that the seed of peanuts must be taken out of the shell before planting. The R. N.-Y. knows not whether Southern peanut planters do this or not. But we do know that in an experiment tried by the R. N.-Y. the seed taken out of the shell failed to sprout, while the entire peanuts sprouted with scarcely an exception.....

YES, Mr. HENDERSON, "Market gardening *is* a poor business for a lazy man." In fact, the lazy man had better live and work in the city.....

AT the Michigan Agricultural College potatoes raised from one eye for four seasons have averaged 115 bushels per acre; from two eyes 160; from three eyes 170; from half-potato 167; from whole seed 182.....

THE R. N.-Y. has for years contended that if potatoes are planted fairly deep and given level cultivation, there will be fewer to grow out of the soil than if they are hilled up. Prof. Johnson of the Michigan Agricultural College says that some raise objections that the potatoes will sun-burn if not hilled up; but the balance of evidence is just the reverse, and the potatoes will not suffer from drought as badly when the ground is kept level. "Plant deep and keep the ground level".....

FARMERS have been a long time in finding this important fact out. Those of our neighborhood object to planting deep and giving level culture because it is far more trouble to dig them, which is true enough.....

THE BREEDER'S GAZETTE says that butter is colored in winter because the public demand it and that "it is the producer's duty to place his goods before the consumers in the manner best liked by all." Is not this argument too broad? queries our excellent contemporary the New England Farmer? "It is the same argument that the oleo men use to excuse themselves for coloring their goods in order to make them imitate real butter."

Coloring matter in the latter case is used to make a sham appear more like the article imitated and is therefore objectionable. If laws could be made and respected which would *insure* that every pound of oleo should be sold as oleo and known to be oleo by the consumers we would not object to its being colored so as to imitate the color of gilt-edge butter as closely as possible. What we want is good, wholesome butter. This assured, we have no question to ask whether the cow or the butter-maker colored it. We have made butter at the Rural Farm for 25 years and have neither colored the butter nor desired to do so. But had we so desired, we should have colored it with as little compunction as we color soup with soy-sauce or eat grapes that were raised in bags.....

ABSTRACTS.

——GEORGE WASHINGTON: Replying to one who had the strongest claims upon his friendship, and who had applied to him during the progress of the Presidental campaign, as we should say, for the promise of an appointment to office, he wrote: "In touching upon the more delicate part of your letter, the communication of which fills me with real concern, I will deal with you with all that frankness which is due to friendship, and which I wish should be a characteristic feature of my conduct through life. * * * Should it be my fate to administer the government, I will go to the chair under no pre-engagement of any kind or nature whatever. And when in it, I will, to the best of my judgment, discharge the duties of the office with that impartiality and zeal for the public good which ought never to suffer connections of blood or friendship to have the least sway on decisions of a public nature."

——BISHOP POTTER: "The constant importation, wrote the author of The Weal of Nation, as now in this country, of the lowest orders of people from abroad to dilute the quality of our natural manhood, is a sad and beggarly prostitution of the noblest gift ever conferred on a people."

——AGRICULTURAL SCIENCE: "The man of sense will approve of the most scientific work at our Stations, but he will endeavor to so frame his words and draw his conclusions that they may be intelligible to his audience whether scientific or practical."

——CONNECTICUT A. E. S.: "Cotton-hull ashes have been for some years the cheapest source of potash in the Connecticut market. The potash is soluble in water, is entirely free from chlorides and is combined chiefly with phosphoric and carbonic acid. The ashes are now used chiefly on tobacco lands, but are worth the attention of all who buy raw materials rather than mixed goods."

——HOARD'S DAIRYMAN: "Professor E. W. STEWART in the Country Gentleman tells how to quickly put flesh on either a poor, or an old animal. 'Cut clover hay short, say, one-half inch, take cheap molasses, and dissolve one pint in one gallon of water and sprinkle this upon three pounds of the cut clover with two pounds of buckwheat flour and two pounds of wheat bran. Feed this amount to each horse, or animal three times per day,—commencing with a little less per day for two days.' The Professor says he put 100 pounds additional weight upon a horse thin in flesh, in 30 days by feeding him said ration."

——FARM JOURNAL: "Super-serviceable friends made it appear that the Editor of the RURAL NEW-YORKER sought the position of Assistant Secretary of Agriculture. We happen to know that he would not touch this or any other political position with a 10-rod pole, even if it had a Cabinet officer's salary at the end of it." [Thanks. ED. R. N.-Y.]

——FARMERS' REVIEW: "The American people are coming to relish mutton better than they did The knowledge that it is the most wholesome meat food of all of the meats has drawn them to it. In the Chicago market half-a-million more sheep will be required in 1889 than were used in 1888."

——WISCONSIN INSTITUTE: "We do not exhaust land by selling the fat of animals, but we exhaust it when we sell their muscle, their bones, their hair, skin and horns. We exhaust land when we sell milk, cheese or eggs, but not when we sell butter. If we sell $200 worth of wheat, or 250 bushels, we are parting with $67 worth of plant food contained in the soil. If we sell a horse worth $200 that we have raised on the farm, we sell $7 worth of plant food; while if we sell $200 worth of butter, averaging 25 cents per pound, we have sold less than 50 cents worth of plant food."

——KANSAS AGRICULTURAL EXPERIMENT STATION: "The R. N.-Y. Branching sorghum, both green and cured, was eaten by our cattle with greater relish than any other forage crop fed this season."

——"KAFFIR CORN yields from 30 to 60 bushels of grain per acre. The stalks have a harder shell than the other sorghums, and our cattle refused to eat them."

For Nervous Diseases

Use Horsford's Acid Phosphate.

Dr. F. G. KELLY, Alderton, W. T., says: "I have prescribed it in a large number of cases of restlessness at night, and nervous diseases generally, and also in cases of indigestion caused by lack of sufficient gastric juice of the stomach, with marked success, and consider it one of the best remedies known to the professional world."—*Adv.*

Miscellaneous Advertising.

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

JOHNSON'S ANODYNE LINIMENT ESTABLISHED 1810.

For Internal and External Use.

Stops Pain, Cramps, Inflammation in body or limb, like magic. Cures Croup, Asthma, Colds, Catarrh, Cholera Morbus, Diarrhœa, Rheumatism, Neuralgia, Lame-back, Stiff Joints and Strains. Full particulars free. Price 35 cts. post-paid. I. S. JOHNSON & CO., Boston, Mass.

THE Brompton Hospital for Consumptives, London, Eng., published a statement that fifty-two (52) per cent. of the patients of that institution have unsuspected kidney disorder. Prof. Wm. H. Thompson of the University of the City of New York, says: "More adults are carried off in this country by chronic kidney disease than by any other one malady except consumption." The late Dr. Dio Lewis, in speaking of Warner's Safe Cure, says over his own signature: "If I found myself the victim of a serious kidney trouble, I would use Warner's Safe Cure."

SATURDAY, MAY 18, 1889.

DON'T mistake the work of the Flea-beetle for potato blight.

THE women as well as the men readers of the R. N.-Y. are treated to a symposium this week. Miss Taplin discusses the important question of "Domestic Finance."

HELLEBORE is, for the currant worm, a safer and quicker insecticide than arsenic for the potato beetle. Look to the currant and gooseberry bushes now. The worms—not over half an inch long, or less—appear on the under leaves first. Then is the time to use the hellebore. The R. N.-Y. puts a heaping table-spoonful of hellebore in a little hot water (a tomato can is handy for the purpose) and when thoroughly mixed into a paste pours it into a pailful of water. This is sprayed upon the bushes through a cyclone nozzle, holding the nozzle *under* the bushes and sending the spray *up through* the bushes. Two applications will suffice.

IF by some miracle, the power to talk and state their grievances could be given to plants, the scene we have pictured on our first page would be enacted on thousands of farms in this country. Do you doubt it? For years the grasses have been playing the killing game of "giving something for nothing." They have done their part cheerfully, providing food for the animals, and furnishing hay for cash. And they have never received even thanks for their service. The farm manure has been put on the other crops. What the other crops failed to take has been left for them to get as best they can. No wonder they make a strike for a fair share of the manure. There is no crop on the farm that deserves fairer treatment than the grass crop. It is the basis of good agriculture. Clover is the spokesman of the group. We hope his appeal will be heard. Has he just cause to complain about the treatment he receives on your farm?

"One cannot make good clover hay and ignore this fact, and still very many try to. The time to draw in is during the hottest part of the day."—T. B. TERRY, page 329.

ON the morning of May 7, the Flea-beetle was found on the potato vines of our "Contest Plot," in greater numbers than we have ever noticed them before, there or anywhere else. Many of the vines were barely breaking through, while a few had made a growth of six inches. It was hoped that they would prove less troublesome this season than they were last, since, in so far as we can learn, a season of abundance is usually followed by several seasons of comparative scarcity. Perhaps the very mild winter may account for this departure from precedents. The R. N.-Y. has made diligent inquiry as to some effective means of exterminating these little, but terrible pests, without success. We know no better to-day how to fight them than we did last year, when we helplessly saw our vines dying from their depredations. At present we are trying tobacco soap dissolved in water and sprayed upon the vines. We shall also try tobacco stem infusions and whale-oil soap. Nearly everything we could think of was tried last year without the least effect in so far as could be seen.

MIXED GRASSES FOR PASTURE.

THE other day we spent the best part of an hour in watching a horse and cow eat grass in a pasture. This observation was not taken from the top of a fence, but the observer got as close to the animal's mouth as he could. If the reader will take the pains to do as much he will learn a thing or two. Animals know what they want. Watch them graze. They do not eat all sorts of grasses. They pick out what they want, delicately and decidedly. They like young grass best. They do not care so much for the rank, heavy growth that springs up where extra manure is applied to the surface. In the spring they like to eat a few dandelions and other weeds that some human beings take in patent medicines. Our horse likes to graze in one place until the grass is cropped close, and then to leave it for a few days until a new, tender growth is made. He also likes to feed on the high ground one day and on a lower place the next. We find different species of grasses on these different parts of the pasture. The R. N.-Y. concludes from these observations that the farmers who advocate the seeding of pastures with a mixture of a dozen or more kinds of grass seeds are exceedingly wise. The great variety of grasses will surely please the animals, and as the grasses mature at different times, there will be a longer supply of the tender, succulent growth that is so much preferred.

FIGHTERS FOR FERTILITY.

ABOUT a year ago—page 479 of last year's volume—the R. N.-Y. gave a record of some experiments that had been started at the Michigan Agricultural College. This record was entitled "Lessons from an Old Pasture" and it will well repay a second reading, because it points out a fact regarding the fertility of meadows, that is most important. On the poorest soil of an old pasture, 24 species of plants—all worthless for pasture except four—were found. On the best soil but 11 species were found, and one—June grass—had almost excluded all the others. The better the soil, the stronger the good grasses grew, and the more the worthless plants were crowded out. On a poor soil *no* plant makes a perfect development. Any seed that falls has a chance to live and that is about all it can do. Make the ground stronger, apply fertilizers and the whole thing is changed. Before, the plants drag through a stunted, blighted existence. There is nothing in the soil worth fighting for. After, the plants break out of their sluggishness and fight with each other for the fertility. The few stronger capture the greater proportion of the plant food, grow up strong and vigorous, and crowd out many of their competitors And the stronger plants will generally be found the most desirable ones—in the case of the old pasture under experiment the June grass fought away the worthless plants. Nature does not make mistakes. If man would study her ways and understand her unchangeable conditions he might turn her into a willing servant.

PERFUMED HAY.

IN his first printed argument in favor of the ensilage system, M. Goffart said that he had frequently noticed in haying fields evidence of what he considered must be a great waste. He noticed that whenever hay was curing, the air was full of a delicate perfume which had evidently escaped from the grass into the air. This seemed to M. Goffart like a waste of the most valuable part of the grass and one of his strongest arguments was to the effect that by means of the silo the farmer could cure his grass without drying and thus prevent the waste of whatever passes away to yield up this agreeable odor. M. Goffart seemed to think that the green grass was like a pile of manure. He had noticed the escape of ammonia from a manure pile, and reasoned that because this escape was detrimental to the manure "the breath of the new-mown hay" must be equally detrimental to the grass. We do not believe there is much in this objection to drying grass. Certainly no chemist has yet been able to measure the nutritive value of this perfume, and it is generally agreed that the agreeable odor is mainly due to certain volatile oils that may be ranked with honey as regards their nutritive values. In fact, it may be said that hay-making has an advantage over ensiloing, since no silage, however "sweet" can compare in fragrance with the best hay. But these oils have their value. They render hay more fragrant, more palatable and hence more agreeable to farm animals. Who has not noticed how eagerly cattle prefer the sweet, fragrant hay, a mow of which smells like a huge tea-chest, to the dull, odorless stuff that some farmers put up? There is a certain time for cutting grass and a certain way of curing it that preserve the largest amount of its perfume. And those who can retain the most of this perfume can be said to have most nearly mastered the science of hay-making.

"The best method by which to improve meadows is improved general farming. Feeding clover and grain, and saving rich manure in a water-tight gutter with plenty of suitable absorbents, will do much to insure success. A soil made fine and free from weeds by thorough and careful tillage is essential to the best results."—C. S. RICE, page 327.

CHEMISTRY ON THE FARM.

THE gradual introduction of Professor Short's new method of determining the amount of fat in milk goes to show dairymen that there is nothing in chemistry for them to be afraid of. By carrying out the simple rules that govern the method, farmers are enabled to conduct a chemical analysis which, 200 years ago, would have been considered little less than marvelous. The R. N.-Y. believes that the farmer who uses Short's method of testing milk will not be satisfied until he learns how to analyze the food that is given his cows. In other words, he will not be satisfied with simply knowing what the product contains, but will want to know what the food used to make that product contains. And he can do it. We believe that the rules for determining the quality of hay and grain can be made as simple as are those governing the milk test. Are such analyses needed? Are not the published tables, so easily obtained from the Experiment Stations, sufficient? Just examine these tables and see how different samples of hay vary in composition. We are given the *average*. The R. N.-Y. finds that, in the Connecticut Station tables—and these are considered the best American authority—wherever 10 or more samples of hay were analyzed, the difference between the minimum and maximum amounts of dry matter, protein or carbohydrates, was very great. For instance, a good many analyses of clover hay were made with the following result—the figures indicating the per cent. of the various substances.

	Dry Matter.	Protein.	Fat.	Carbo-hydrates.
Poorest.....	78.2	8.9	1.5	35.
Best.....	93.9	20.8	4.3	49.
Average.....	88.62	12.55	2.44	40.55

It is very probable that these wide differences in value are due mainly to different methods of curing and handling. If a farmer proposes to make use of the results of chemical analysis in his feeding, what can he do but take the *average* analysis which may be from 10 to 50 per cent. out of the way.

The R. N.-Y. respectfully submits, 1. that any farmer who pretends to follow these tables in feeding his stock would make money by knowing whether his hay was above or below the average in value. 2. The rules governing the analysis of feeding stuffs can be so simplified that any man who can conduct Short's milk test, can learn to analyze hay and grain. If we are not right, will our agricultural chemists please tell us why not?

CHEMICAL FERTILIZERS AND GRASS.

IT will be noticed that a number of our correspondents speak of using chemicals in the work of restoring meadow fertility. Most of these persons live at the East, yet it will be noticed that a Western man asks, on page 330, for information which none but Eastern farmers can give him. Western farmers, as a rule, do not like to consider the possibility of being obliged to use chemicals. Stable manure and clover should measure the fertility of Western farms, and as clover depends more or less upon manure, it is safe to say that the quantity of manure made and saved on the farm, should determine the fertility of that farm. This used to be the rule at the East, but industrial development has changed that. It simply does not pay farmers to make the amount of manure they made years ago The West supplies us with meat cheaper than we can raise it. The forces of production and transportation have so arranged themselves that we find it cheaper to buy a portion of our manure in the form of fertilizers. In sections of this country where the dressed beef companies must look for their supplies of fat cattle, there will probably never be any need for chemical fertilizers. Wherever the dressed meat handlers supplant local butchers, one of two things must follow: the dairy interests must be largely increased or farmers will be obliged to use more chemical fertilizers.

We give, on another page, the views of some Eastern farmers who use fertilizers with special reference to their effect upon the grass crop. They are all good farmers and speak from experience. We may say, in this connection, that it is our plan to work the R. N.-Y. New Jersey farm into grass as soon as practicable. We are not able to do this all at once; we shall not be able to proceed any faster than the farmer in ordinary circumstances could do. Most of the farm, when we bought it, was in rough pasture fields, grown up to brush and weeds, or in worn-out, grassy corn fields that had been farmed "on shares." It is our plan to plow each year a few acres and apply all the stable manure we can secure, raising corn and giving careful cultivation. The next year potatoes will be grown with at least 1,500 pounds of a high-grade potato manure. In the fall the potato ground will be seeded to rye and Timothy, with clover to follow in the spring. When all the area that we wish in grass is seeded, we shall apply manure to the grass. Until that time we shall use a "complete" grass manure. Whenever the yield falls below the standard, the grass will be plowed and the land given the regular rotation of corn and potatoes.

"Dairying, sheep-breeding and hog-raising all pay a living profit if conducted in a business like manner. All the above-mentioned branches of farming consume the products of the farm, and return to it nearly all the plant food. This gives an increase of income, because the productive powers of the farm increase from the method, thus making the keeping of more stock practicable."—CHARLES CHAPMAN, page 329.

BREVITIES.

OATS and peas seem to be popular as stock food.

HEADS of rye were "out of the boot" on May 2.

PROF. ROBERTS, page 328, speaks a good word for hay crops.

WHY do most of our Eastern readers prefer to seed down to grass after potatoes?

WE have so much about hay that the horse picture, promised last week, has been crowded out.

TIMOTHY and clover! A great deal of our agricultural wealth seems to rest on these two grasses.

HOW many have tried the plan of seeding to grass in the corn field as advocated by Mr. Paine on page 335?

THE plan proposed by K. M. T., on page 332, certainly turns straw into cash, but it takes the life out of the soil nevertheless.

INCREASING the productiveness of our meadows. This topic is discussed by all our contributors. It is a timely topic. Read what is said in this number.

THE use of mowing machines has lessened the number of men who can do good work with a scythe. This means more weeds on the roads and in fence corners.

GREEN grass forms a "perfect ration"—not all grass, but the best grasses. The best hay needs an addition of grain to give the best results. Poor hay will barely sustain life.

OSCAR CLUTE, of California, who has been teacher, editor, and minister, is to succeed Assistant Secretary of Agriculture, Edwin Willitts, as President of the Michigan Agricultural College. He is 48 and an old graduate of the institution.

THE Wisconsin Station urges farmers to use more clover in the silo. Many find it difficult to cure clover hay and get it just right. There is no difficulty about making it into good silage. It does not need to be chopped before going into the silo.

MR. TERRY tells how he cures clover hay. His horses keep in good condition on such hay, without grain. There is a good deal in the curing of such hay. Some farmers would take the same clover and cure it so that horses would nearly starve to death on it. Are we not right in this?

IT has thus far been the most delightful spring of which we have any remembrance. And it is just such delightful springs that, in the quiet valley where the R. N.-Y. does its experiment work, coax out the grape-vine shoots and blossoms to be killed by rarely missed frosts in middle May.

THE great American Meat Company, which, it was generally supposed, had collapsed on the resignation of Flagler as President, and Moss as Secretary, a few weeks ago, has been reorganized. Ex-Senator Warner Miller, of New York, has become President, and ex-Congressman Belden, of Syracuse, his principal associate. Flagler and Moss, of the Cotton-Seed-Oil Trust are still among the directors. The terms of the new organization are substantially the same as those of the old.

IT may be well to remember the remedy for the clover midge that was proposed by Mr. Warren, a R. N.-Y. subscriber, of Medina County, Ohio. Mr. Warren runs the mower through the field about the middle of May, leaving the product on the ground as a mulch and fertilizer. After this there develops a vigorous crop of blossoms. This comes between two broods of the midge and thus escapes attack. Another plan is to cut the hay crop 10 days earlier than usual. This early-cut clover can be used in the silo.

Field Crops.

HAY.

(*Continued from Page* 330.)

average. Stable manure and land plaster are our only fertilizers.

5. We have tried no new grasses or substitutes therefor here of late.

6. The productiveness of our meadows can, I think, be best increased by a judicious rotation of crops and a liberal use of stable manure. My own rotation is: 1, Corn on sod, manured; 2, oats or wheat, with grass and clover seed; hay for one or two years, according to the stand secured and the condition of the meadow. Some neighbors follow about the same rotation, manuring the grass instead of the corn. They leave the meadow two years and put on manure the first fall after seeding. Permanent meadows are not, as a rule, a success here, though I have seen a meadow on low bottom land seeded to Red-top and Alsike clover, which had done well for several years.

Brillion. E. G. F.

FROM VERMONT.

1. TIMOTHY is sown for hay here as a rule; though some sow Red-top with Red and Alsike clover. The early cutting of grass is favored, as the hay makes better feed for cows and young stock and the land does not run out so soon.

2. The Buckeye, Granite State, Bradley, Champion and Wood mowing machines are used, and the Champion and Tiger rakes, and the Mudgett and Thomas tedders.

3. On river farms meadows are reseeded about once in six years, in the spring, with oats or barley; our hill farms do not require seeding so often.

4. Probably 1½ ton per acre. Stable manure is used. Few have tried commercial fertilizers for grass.

5. No new grasses have been tried here in recent years.

6. Many of our best farmers practice top-dressing in the fall.

Warren. F. H. M.

Timothy and clover are the principal grasses grown in this section for hay, though Red-top and Orchard grass are raised to a considerable extent. I favor early cutting, for the reason that much better results are obtained from feeding the hay, because, as I think, the fresh spring grass is nearer to a perfect food than anything we can get, and for this reason farmers should strive to have their hay resemble, as closely as possible, dried green grass. I think that, on an average, I seed down once in five or six years, but this depends largely upon circumstances. In certain soils, with favorable seasons, large crops of hay may be grown for a much longer time with a light top-dressing of manure once in two or three years. I prefer to seed with wheat when seeding with grain: but for several years I have plowed in August, harrowed in manure and seeded without grain, and I have never failed to cut a heavy crop the first season. My average yield for several years has been more than two tons per acre. I use barn-yard manure principally, though I think commercial fertilizers can be used profitably for grass. I have not tried any new grasses or substitutes recently. The best way, in my opinion, to increase the productiveness of the meadows, is to give thorough cultivation of the soil, plenty of manure, and plenty of grass seed. Many farmers sow too little seed when seeding down. I would rather sow one bushel of Timothy and two bushels of Red-top per acre, than a smaller quantity, as the extra yield of hay will many times more than pay for the extra seed. I think more attention is now paid to the grass crop in this section than was formerly. Farmers must be governed, to a certain extent, by the character of their soil in growing the grass crop, just as in the case of other crops. F. E. L.

North Pomfret.

1. Timothy, Red-top and Red and Alsike clovers are generally used here for hay, and on our river bottom lands Timothy, Red-top, Fowl Meadow and Alsike. We cut early for hay for all kinds of stock except horses. Early-cut hay is more easily digested and assimilated, but more liable to be dusty, and therefore injurious to horses. The precise time to cut hay so that it will be most valuable is just when the grass is out of bloom; but it changes rapidly from that state, and practically I am compelled to begin cutting when it is at an earlier stage.

2. The list of haying tools, especially of mowers and horse-rakes, is too long to mention all. I use Walter A. Woods mowers and rakes, a Bullard tedder, a Keystone hay-loader, and a double harpoon horse-fork.

3. I usually re-seed once in five or six years. My usual rotation for heavy clay soils is peas and oats on green-sward; next, barley and grass seed, followed by clover and Timothy. I use large Northern clover and Timothy for renovating heavy clay soils, with Red-top added on moist lands. For loam lands my rotation is, first, corn, followed by barley and grass seed, Medium and Alsike clover, Timothy and Red-top. I use peas freely as a first crop, because they are rich in both plant and stock food, and they leave the soil in excellent condition for succeeding crops. I sow oats with them because they are excellent stock food, and hold up the peas so that they can be harvested by horse-power. They are a somewhat exhausting crop, and for this reason not especially fitted for renovating purposes. The same may be said of barley; but both are excellent for stock food, and the latter is well adapted for use in connection with grass seed. I formerly used wheat with grass seed, but its low market value at the present time prevents its being profitably exchanged for stock food, and no New England farmer can afford to sell grain except in the way of such an exchange. The clover crop is my chief reliance in the way of renovation.

4. The average yield per acre of peas and oats, on large fields of green-sward is from 25 to 40 bushels; of barley from 20 to 40 bushels. In one case I had an average of 43 bushels of Imperial barley on a field of 13 acres of heavy, clay soil. Clover (large Northern) averages from two to three tons per acre. This will be followed after two or three years by Timothy, and when the yield is less than 1½ ton per acre, I plow, and repeat the rotation. I never use large Northern clover on a rich loam soil. In such cases there is liable to be an overgrowth, and consequently poor quality.

5. No new varieties have been introduced that I am aware of, since the introduction of Alsike clover, and Orchard grass. The former I have used successfully for the last 20 years. I have not made a success of the latter. It is quite too "smart" for me, and, besides, it does not produce enough seed, and it costs too much to purchase the latter.

6. By plowing, and the use of some rotation like the one I have pointed out, we can supply ourselves with grain, while raising a larger aggregate amount of hay, and at the same time producing a rapid increase of fertility, provided always that the plant food produced or its equivalent is returned to the soil. The plow may be used with ruinous effect upon the farm and the farmer's hopes of success, but when judiciously used, in connection with an intelligent system, it is the most important agent in the work of crop production, and farm improvement. F. D. D.

Whiting.

1. THE grasses, including clover, in this section, are about as follows: Herd's grass or Timothy is the principal kind raised, and Red-top comes next. Only a few have sown Orchard grass, and at present I do not know of any field of it. It is liable to winter-kill. June grass is plentiful in all our grass fields, but seed is not sown often. A few have sown Meadow Fescue with good results. Red, common, and Mammoth clovers are sown freely, and Alsike is becoming quite common and is much esteemed. I favor cutting the grasses early. Early-cut hay produces, I think, better results in milk flow than late-cut. I consider late-cut Herd's grass a very poor feed for milk. A mixture of Alsike and other clover with Red-top and Herd's grass cut early is, in my opinion, the best for winter dairying.

2. Nearly all the mowing machines in the market are used here; but I think the Buckeye leads. The latest improved kinds of horse-rakes are in use by most hay-makers. Tedders are coming into use a good deal. These with the common drag rake, and improved pitch-forks and hand-scythes complete the list of tools in use.

3. I generally seed down after taking off three grass crops; corn or other crops follow, breaking up the sod. The old way of seeding was to sow the grass seed with an oat or wheat crop in the spring, and generally a good grass crop followed; but of late years I have seeded down to grass in the corn field, with level culture of the corn crop. This is a good way. I sow the seed from about the middle of July to the middle of August, going through every row. At this time the corn is in transition from the silk to the milky state. A cultivator is run through and the ground is raked over, after which the seed is sown. The ground is shaded so that seed rarely fails to germinate. Grass seed is frequently sown on winter grain fields. The average yield per acre on my farm, including rowen, is slightly over two tons per acre; but the crops on many farms in town will not exceed a ton to the acre. In the whole town an estimate of 1 1-2 ton would not be far out of the way for an average yield per acre. All kinds of manure are used; special fertilizers are used to a great extent in connection with barn manure.

The new grasses are not much used here. I have sown Meadow Fescue on several occasions and my experience is that it makes an excellent hay, very good for winter dairying if cut early, and it is very hardy and will hold out longer than most other grasses.

6. I know of no better way to increase productiveness than to plow up, manure heavily and seed down in the corn field. One of my neighbors has increased his grass crop greatly by top-dressing in the fall, and last year his whole mowing fields produced two crops of nearly three tons per acre.

South Randolph. C. G. P.

FROM NEW YORK.

1. TIMOTHY and clover: Timothy for the Troy market where it brings from 80 cents to $1 per 100 pounds according to the supply. Most emphatically I favor early cutting, as soon as Timothy is all headed out, and as soon as clover is in full bloom. Early-cut Timothy will sell for 10 or 15 cents more per 100 pounds than late-cut. Ripe Timothy is not much better for feeding than oat straw.

2. We use the various mowers that are in the market, and wheel-rakes, and some use hay-tedders, but I do not use one myself, as I think such implements break up the hay too much. Various horse-forks and hay carriers are also used.

3. We re-seed about every three years, with rye usually, sowing Timothy seed in the fall and clover in the spring.

4. From two to three tons per acre. Commercial fertilizers are mostly used. They are sown with a drill when the grain is sown.

5. A few are trying or going to try Alfalfa. I have not had time to note with what success.

6. More manure in almost any form will help to produce larger crops. A. H. S.

Melrose.

1. RED CLOVER (both large and medium) and Timothy. As hay is largely the money crop here with many farmers, Timothy leads. We cut clover when it is in full bloom; Timothy as soon as the bloom falls, because the quality is then at its best, and, I think, the weight of hay is greatest.

2. Many styles of mowers and steel-tooth horse-rakes are used, but very few loaders or tedders. The hay is stored in barns as soon as possible with a double harpoon horse-fork, hay carrier and tackle. Fowler's cars and many other good kinds are in use. The hay is pressed by the buyer, by means of the Dederick perpetual steam or two-horse press.

3. We seed with the second or third crops (oats or fall grain) after breaking sod. We sow 10 to 12 quarts—one part clover, two parts Timothy—with oats, Timothy with fall grain; clover in spring, same proportion, and we usually mow three or four seasons.

4. About one ton. We use but little manure, except what is applied when seeding with wheat—mostly barn-yard with some phosphates.

5. We have lately tried Alsike with indifferent success. It does not seem to thrive here as in some localities.

6. The productiveness of meadows can be improved by the use of more barn-yard manure and ashes. No stock should be allowed to pasture on meadows before or after cutting. A gradual increase should be made in the depth of plowing, but not in *all* of our soils. F. D. S.

Ithaca.

1. The principal meadow grasses grown in this section are common Timothy, Red clover and Orchard grass. Occasionally we find a little Red-top and English Blue grass, but not in large quantities. Orchard grass is not grown as much as formerly. Early cut grass I consider the best for hay, as it will be less wiry, more nutritious and more easily masticated and digested.

2. Nearly all of the improved mowing machines are in use here. Hay tedders are also in general use. The Thomas takes the lead. The principal rakes used are the Bradley, Thomas, Tiger and Buckeye. The Keystone hay-loader has been used, but does not give general satisfaction, it being better adapted to the prairie farms of the West. The harpoon hay fork is the best.

3. On gravelly land we re-seed once in four or five years; on low land or muck, once in five or six years. We seed with oats or wheat. Early spring is generally the best time, as the stand is not so apt to winter-kill as that from late or fall-sown seed.

4. The average yield is about 1¼ ton per acre. Cow or any kind of well rotted manure is used in top-dressing newly-seeded land. Commercial fertilizers are used in seeding, but very little as a top-dressing.

5. Some are experimenting with Alfalfa. It has not been long enough in use to warrant a report on the result.

6. To increase the productiveness, do not pasture the meadows; plow as often as needed, and keep up a good crop. The more manure that is placed on the land, the better: but we are sadly limited in this repect. Very few farms produce manure enough to keep the meadows in proper shape. Can commercial fertilizers be profitably used as a top dressing on meadows? C. H. F.

Forestville.

1. CLOVER and Timothy with some Orchard grass and Alsike clover make good hay, if put on rich, moist land. I favor early-cut hay every time, because it has more nutriment and will make cows give more milk and that is what we want in old Chautauqua county.

2. I intend to seed down every third year either with oats or wheat—oats in the spring; wheat in the fall—to Timothy and sow the clover early the next spring.

3. The average yield per acre is about "two tons on our best farms;" 1½ on the poorer ones. The yield depends a good deal on the owner of the farm.

5. No new grasses are being tried in this locality.

6. When the land is under the plow give thorough cultivation, forming a perfect seed-bed. Save all the barn-yard manures and apply it as soon as made and, when enough cannot be secured, make a judicious use of commercial fertilizer. Be sure to find out what your soil lacks first, and then apply that which will fill the need. Keep stock off the meadows at all times of the year. A man who fails of success after practicing these rules had better quit farming, but I don't believe in using much commercial fertilizer, for the crops ought to be all fed on the farm and help to make it more and more productive. P. L. D.

Cherry Creek.

THE acreage devoted to hay on the average hay farm is over three-fourths of its area. The remainder of the farm is devoted to grain crops. As the old meadows "run out" or fail to produce paying crops, the ground is plowed and sowed to some grain crop. With this grain, Timothy and clover seeds are sown in about equal parts at the rate of six to eight quarts to the acre. Some, in their haste to get first-quality hay, are foolish enough to sow Timothy alone; but this practice is not general. The length of time a field will produce hay without re-seeding will vary with the original fertility of the soil and with the quantity of fertilizers or manure applied. One field that I know of has been mown for 15 successive years, and year after year has produced over one ton per acre without manure of any kind. The average yield for this vicinity, taken altogether, has not been over three-fourths of a ton per acre for the last two years.

Among the improved tools used may be mentioned the five and six-foot-cut mowing machine, the self-dump horse-rake, and, last but not least, the horse-fork with a carrier running on either a wooden or iron track. This makes it possible for the farmer to utilize all the space in his high barn with less help; besides, the hay can be unloaded much more quickly than by hand.

A large portion of the hay is sold in the fall and early winter, the purchaser sending a portable press to the farmer's barn with teams and hands. The farmer boards the men and beasts and hauls the hay to the nearest railroad station. Many claim that the extra ease in handling and hauling pays for the board of teams and men. The distance from market probably determines the most profitable way.

To tell how fast the yield of hay is diminishing would be well-nigh impossible. A good indication that there is a decrease may be found in the remarks of the many who say: "Farming don't pay!" "Our land is not what it used to be;" "About half a crop this year and the sod looks as if there wouldn't be any next." These are the men who have sold their soil at one-half cent per pound and are now mourning over the barren fields.

C. C.

FROM INDIAN TERRITORY.

1. The only tame grass grown for hay in our country is German millet. A few of my neighbors, like myself, have experimented somewhat with clover and Timothy, but I think without success I know that I made a failure, owing, I think, to dry seasons and ignorance as to the time to sow, and the manner of seeding down. I sowed one bushel of Alfalfa two years ago. The first season it barely caught in spots; last year the weeds took the land so that what remained could not do much better. I pastured some yearlings in the field all the past winter. This spring I see the Alfalfa is spreading and I will fence off about two acres along with three acres of prairie grass, for a calf and sheep pasture. I believe pasturing will cause

the Alfalfa to spread,and I know it will keep down weeds and give the plot a better show. Native prairie grass is our main dependence. All have it in great abundance. I prefer early cutting; that is, in July when the grass has just got its growth. The Buckeye and Champion are the leading mowers in our neighborhood, although we have mowers of all kinds Sulky rakes are indispensable, stackers and hay presses of different kinds are being introduced. Millet will yield from one to four tons per acre; it is not a success every year. Prairie grass in an ordinary season, will yield from one to two tons per acre according as it is cut on upland or bottom. Our dependence heretofore has been on raising cattle; but depending on cattle alone to bring in money while paying out at all times for almost everything else, will sooner or later bring to grief. I, for one, am going to raise any crop that will pay me fair returns for the time and labor spent on it.

Oowala. J. S. F.

FROM ILLINOIS.

THE first settlers on the prairies used the native wild grasses for hay and pasture. The prairie grass is easily killed when the land is once brought into cultivation, and it never reappears. I do not know of any effort to reseed it. Timothy, clover, Red-top and millet, are mostly used for hay now. Blue grass, of which there are several varieties, makes the best permanent pasture. I have never made a careful test as to the proper time for cutting. I have a notion that early-cut hay would be less woody and more palatable to stock; but I think it more liable to be dusty in the mow. During the Civil War when help was scarce, I seeded my farm largely to Timothy, and cut the seed with a header, taking off from six to 10 inches of the top, leaving most of the straw and blades which I cut with a mower, the grass having to stand until the seed was ripe. The hay was stacked as soon as possible after it was cut. The heads were drawn to the stack-yard when cut and stacked in as narrow piles as possible on each side of a ventilator, and covered with slough grass. I fed hay put up in that way for 10 years, stock eating it with a relish and thriving on it. I sometimes think that the early-cut theory is only a notion. There are a great many different makes of mowers, rakes, forks, derricks for stacking, and carriers for barns, and occasionally a loader is in use. Portable presses are mostly used for baling for shipment.

I have not adopted any system of rotation. I often keep a field in grass eight or 10 years, by top-dressing it with stable manure and harrowing with a sharp-toothed harrow. The crop will be nearly doubled by such treatment and the effect will be noticeable for a number of years.

The best time to seed down is very early in the spring on fall wheat or rye. The best spring crop to seed with is flax. Oats are the only small grain crop generally raised here, and most farmers seed with them; but oats are rank in growth, and take up the moisture so fast that young Timothy will perish if the weather is dry in May or June. Timothy sometimes makes a good stand sowed on oat stubble in the fall. J. R. B.

Chatsworth.

IN this part of Illinois Timothy and Red-top are grown for hay, and are almost invariably mixed with Red clover. The mixture of Timothy and clover is preferred for meadows. Clover itself, though very nutritious, is very hard to cure when grown alone. Where there is a mixture of the grasses with clover a larger crop is grown; it forms a more palatable and nutritious feed; it grows up quickly in dry weather after cutting, and protects, in a measure, the grass from the hot sun, besides forming a mulch and preventing a very rapid evaporation of the moisture of the soil. Moreover, it improves the mechanical texture of the soil as well as increases its fertility. The thick growth helps to prevent the growth of noxious weeds that rob the soil, shade the grass and injure the quality of the hay. It also causes the farmer to cut his grass earlier, thus securing a great gain in its feeding value. If the grass be cut moderately early, though there may be a slight loss in weight, this is much more than counterbalanced by the gain in the digestibility and palatability of the feed, and the waste from shattering, that usually attends late cutting, is avoided. The whole object of the plant growth is to produce the seed, and if this is allowed to ripen, most of the nutrition of the stalk is transferred from the stalk to the seed, while a part of the stalk that would have been digestible if cut early, is converted into indigestible woody fiber. Should the seed not shatter off before it reaches the animal, a great share of it remains undigested, and the loss as feed is just as great. In this vicinity the grass if cut early usually gets the benefit of one or two showers before dry weather.

We seed down after the land has been cultivated three or four years, and usually after cutting a few crops convert it into pasture for a year or two before breaking it up. We usually sow Timothy and clover at the same time—early in the spring—and have no trouble in securing a stand unless the seed is sown with oats. Then if the spring be dry the Timothy suffers. Sowing with a rye or wheat crop is preferred.

To increase the productiveness of our meadows we should feed what hay we make and return the crop to the land as manure; raise a larger percentage of clover; keep down all foreign growth; sow more varieties; avoid close cutting, or pasturing too closely during the dry season, and not use the fields for meadows until the White clover and Blue grass form a stiff, close sod. L. M. W.

Shelby County.

FROM MICHIGAN.

1. TIMOTHY, Mammoth and Medium clovers are sown for hay here. I prefer early cutting for these reasons: The hay is not so dusty when taken out in winter, it cures softer, not being so dry and hard; if clover, a nice lot of green blossoms and leaves are saved, whereas if the crop is allowed to get ripe, one has a lot of black, dry stalks by the time he gets it to the barn.

2. The Champion mower I think the best for stumpy land. Several kinds of riding hay rakes are used.

3. I let the seeding stand three to four years and then plow the grass under and plant the land to corn and potatoes,and then sow to wheat or oats, and seed down again. We often seed with buckwheat, in fact, grains of all kinds—generally in spring; sometimes early in fall, from middle of August to middle of September.

4. The average yield hereabouts is about 1½ ton per acre. I have never used any manure on grass, except land plaster.

5. I have never used any new grasses.

6. In regard to increasing the yield of grass, my plan is to plow under a good crop of clover, or an old pasture, plant the land to potatoes or corn, then to some other grain crop and seed to grass of some kind. Use all the barn-yard manure you have on the grain crop after a potato or corn crop. It this method of farming is followed up, you will likely raise good crops of grass. S. M. R.

East Jordan.

ALFALFA.

As regards the growing of Alfalfa for pasture or hay, I think it is an unsettled question whether it is a profitable crop for the Michigan farmer or not. That it will grow in most parts of the State there is little doubt; but whether it is more hardy than our common clover has not been fully determined.

Some farmers in this vicinity are sowing Alfalfa with very good results so far as making it grow is concerned. It has not been grown long enough to permit any test of its merits for hay. One farmer succeeded in getting a good start by sowing about 15

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

Domestic Finance.

PIN-MONEY AND HOUSEHOLD ALLOWANCES.

WHAT THE WOMEN SAY---WITH A FEW QUOTATIONS FROM THE MEN.

"Let a man give his wife equal partnership, and initiate her in the secrets of the business, and she will be ever ready to be a help-mate in preference to a nonentity."

"WHAT'S mine's mine" is the rule in a good many matrimonial partnerships—not the best rule in the world for a harmonious union. One of our friends has, engraved within her wedding ring, this posy, "Each for the other, and either for both—" which certainly applies to money-getting and money-spending, as to everything else in domestic life. There is no hard-and-fast rule for the household purse, which applies to every family—differing circumstances cause different arrangements; but *no* wife should be obliged to ask—perhaps to beg—for money with which to meet legitimate expenses.

* * *

"In the ideal home no system of book-keeping is necessary, except to ascertain the amount of the necessary family expenses. In such a home the mother and daughters are full partners with the husband and sons. It is not a question of individual income or expenditures, but of united income and general expenses."

That is a man's opinion, and a very fair and honest one, we think. What seems to us necessary is complete confidence—let the husband make a clear statement of his income, for one thing; for many wives are unintentionally extravagant simply because they do not sufficiently understand their husbands' circumstances. Another thing which too often promotes extravagance is the credit system. When a woman is allowed to run up an account wherever she deals she is very apt to be far more extravagant than she would be under a system of cash payments. It is so easy to buy unnecessary things when all one has to do is to have them charged to the husband's or father's account, only, unfortunately, a day of reckoning must come. Keep house on a cash basis—that is a brief, but most excellent rule for the domestic finances.

* * *

"As a general rule, it seems only just and fair for the husband to take care of the money."

That seems perfectly right; the husband certainly is the head of the household, yet many women are far more careful and frugal than their husbands. It could hardly be a very agreeable feeling for a man to be dependent on his wife. But it is no less galling for the wife to be so dependent that she has not a penny of her own,and it is quite as hard for the wife to beg for money as it is for the husband. The right way—the only way—for perfect harmony is to carry out the principles of the ideal home, such as one of our correspondents suggests.

WHAT THE SCHOOL-MA'AM THINKS ABOUT THE FAMILY POCKET-BOOK.

BY the family pocket-book we may understand two different things. It may be taken literally to mean the purse in which the household money is kept; or it may mean the part of the income that is to be spent for domestic purposes.

As to the first meaning: In a good many houses it is customary to have a purse kept in a convenient drawer or closet, in which the amount to be used for household purposes is put at stated times; and any member of the family is at liberty to go to this purse whenever he or she wants to buy anything for use in the house. This plan has its advantages in some ways; as, for instance, in saving the time and trouble of going to find mother when you want to go to "the store" in a hurry. But I think there are objections to this plan, which must be obvious to the systematic and careful housewife, and I still cling to the old notion of going to ask the mother for money when needed for the house.

Treating the subject from the other point of view really embraces the whole of domestic finance; and of this vast subject I shall treat only of the principal points. A subject that has received a good deal of attention with some people is: "Who is to keep the money—the husband or the wife?" Of course, no set rule will answer for all people, and every family must be judge of its own case; but, as a general rule, it seems only just and fair for the husband to take care of the money. When a woman marries, it is supposed that she has confidence in her husband in all ways, (if she hasn't she had better not marry), and it does not show much confidence if she is afraid to let him keep the money. Just think of the case of the man who gives over (because he *has* to) all his earnings to his wife, and has to ask her for every cent he spends! I have known such a case. Imagine him going meekly to his wife and saying:

"Mary, my dear, can you spare me two dollars? I would like to take you to a concert to-night." I think Mary would not be taken to concerts very often. The wife should have a certain share of each month's wages—as much as is needed to cover all her expenses nicely (and as much more as her husband's income and generosity will allow), and all the rest should be left in the man's care. It is often a good plan for the two to run a friendly race, to see which is able to save most in proportion, out of their week's or month's account.

If you are not able to save something—if it is only a dollar a week—to put aside, ready for the hard times that are almost sure to come at some time in your life, you are working backwards, no matter how large an income you receive. Bear in mind, my friends, that an article is not always cheap because it costs little. It is more economical to pay two dollars for something that will wear two years than to pay one dollar for an article that will not wear a year. True economy is not always shown by spending the least amount of money. Lastly, no one person can do all the saving for the family. Each one must do his and her share if success is to be attained. PANDANUS.

WHAT A MAN THINKS ABOUT DOMESTIC FINANCES.

J. H. G.

IN a family where the true "Spirit of the Home" has been materialized, where the spirit of Christ predominates, there is no trouble about finances; that is, in so far as the different members of the family are related to each other in money matters is concerned. It is only in families where the Spirit of Evil—the essence of selfishness—prevails, that money matters become a cause of quarrels and consequent unhappiness. In the ideal home no system of book-keeping is necessary, except to ascertain the amount of the necessary family expenses. In such a home the mother and daughters are full partners with the husband and sons. It is not a question of individual income or expenditures, but of united income and general expenses. When the daughter goes to town to do the shopping, her chief trouble is, not what she shall get for herself, but what she shall get for "mother" or sister or her little brother. It is a source of annoyance that "mother's" wants are so few and simple. If she has any needs she will not tell of them until all the other members of the family are provided for. While it is true that Christ appeared in the form of a man, his closest imitators have always been women—mothers.

In the ideal home the question of finaces is one that settles itself; it just drops into a groove and runs without a jar or friction. It is simply a question of who best can work and best serve. Such things as a regular "allowance," individual cash books or any other method of calculating individual expenses is entirely unnecessary. In fact I think the keeping of individual accounts is conducive to parsimony, selfishness and jealousy. It is said that the best way to make children deserving of suspicion is to suspect them; certainly the best way to make children miserly or extravagant is to keep the subject of money constantly before them. Fortunately the happiness of the family does not depend altogether upon money—the higher form of happiness depends upon love, sacrifice and unselfishness: in by far too many cases the love of money crushes out all these higher emotions.

It has been my good fortune to be intimately related only to those in whom I have had unbounded confidence. It is very seldom my children ask me for money, and as a rule they refuse it when offered to them. In the family we are all anxious to increase the family income and limit the expenses. The eggs from the little Bantam hen are a part of the income of the family as well as my own salary; the stick of candy is a part of the family expenses as well as the coal bill or the taxes. Only those things which are deemed necessary are purchased and no record is kept either of income or expenses. Happy is the individual—and thrice happy are the members of the family—who can truly and devoutly say from the bottom of his heart—in money matters as in other things—"The Lord gave;

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

the Lord hath taken away; blessed be the name of the Lord."

BOTH EARNING AND SPENDING.

THERE are so many ways for money to go that it is not only pleasant, but it also helps a great deal for the wives and children to earn a little pin-money by some employment that is their own particular care. Among the justly popular industries for this purpose is the raising of poultry and eggs for market. If one has a large inclosure and a pond for ducks and geese, they pay well and eat no more than chickens according to their size. They can be raised in a pen and swim in a pan, but in that case they are terrors so far as eating is concerned, as foraging, when they can indulge in it, supplies nearly one-half of what they need; but they are unmitigated nuisances if allowed to run at large.

Keeping bees is both profitable and agreeable to many. The expenses are small and a woman can do all or nearly all the work, and without doubt the "guid mon" would lend a helping hand when needed without any expectation of reward except all the honey he wanted to eat at the table.

In some localities it is considered a considerable advantage to board the school-teacher; but with us doing so is rather a doubtful gain as the price ranges from $1 to $1. 50 per week.

In the summer there are generally dry goods, grocery and jewelry peddlers traveling about and it pays very well to keep them over-night or for a meal as it may happen. Generally they have regular days for their trips, and accommodating them causes but little extra work as one knows when to expect them. In the "good old times" many a woman dried $50 worth of apples in a season; but no one can do that now I suppose; still with a small stove evaporator some of the surplus berries, cherries, plums, pears or sweet corn could be dried, and these could be sold at a profit—you see I take it for granted that every farmer should raise all the berries he can use. Our pigs and sheep like apples so well that we are not tempted to use our surplus of that kind of fruit in any way, except as feed. If a man cares for and milks the cows and a woman makes the butter it seems to me it is only fair that the proceeds should be divided. The pet lambs disowned by their mothers and the lame pigs that have been raised by women are so much saved as well as earned. Many a wife feeds a calf through the summer and sells it in the fall; but here it is not profitable as a four-week's-old veal will sell for as much again in the spring as if it were kept till the fall. There are many other equally profitable employments; but those mentioned are possible to any farmer's wife, while most of the others could be profitable or practicable only in exceptional cases.

Generally speaking, I do not believe in allowances. Husband and wife should represent a partnership, and as each is working for the same purpose, each should have an equal right to the money earned; and a prudent wife is as much instrumental in keeping expenses within bounds as is her husband, and many times a great deal more. There are a very, very, few women who want to buy everything they see, and who will run in debt for it if they do not have the money. The only way to check this extravagance seems to be by providing them with an allowance that must not be exceeded. It is sometimes thought necessary to adopt the same method in household expenses; as it has been very truthfully said: "A wife can throw out with a tea-spoon all her husband can bring in with a shovel." But, thank goodness! such women are the exceptions, and very rare ones I believe, as nearly all women are glad to prove helps instead of hindrances. If a person weighs well the need of an article before buying it, there is little danger of extravagance, and in many pleasant, bright homes the practice of economy, not stinginess, is a necessity.

Many people think it desirable that children should be taught the value of money by giving them an allowance, but it is better to let them earn pin-money by doing some little tasks they can perform, and then they will learn the value of money by experience. There is no other true way to teach it to them, and surely no better one. It is a mistake to allow children to grow up without any cares; the hard work of after life will be so much lighter if father and mother give them little duties to attend to, and make the latter as attractive as possible. No other class of people have the opportunities to benefit their children by amusement and instruction that farmers possess.

H. BELLE CHAPMAN.

A LETTER FROM AUNT HETTY.

I WISH to relate my experience concerning money matters during my married life. I am an old woman now, but in my married life there has been one bright pleasure that few have enjoyed, and that has been due to the fact that I have never had to ask for money. In saying this, I feel that I have the envy of all, or nearly all, my lady readers. When my husband took on him the marriage vows, it meant to him that he had married a wife, and not purchased a slave. He looked upon her in the light of his helpmate, and his partner for life, and treated her as such. He told me all of his affairs and plans, thus showing me that he thought I was worthy of trust and confidence and, in return, I confided fully in him. He kept an account of every penny earned and spent, and I also kept a record of the money I spent. At the end of every week, we carefully looked over our accounts, and then he'd replenish my treasury according to our financial circumstances, and as the family increased, and our income too, he gave me more. How much we did enjoy looking over our accounts! He thought it was an excellent plan to keep them, for then we knew where every penny was spent, and what we could afford. It is very galling to a woman to have to ask for every cent, even if it is given pleasantly; but when it comes to complaining, scolding, and putting her off with less than is needed, it makes a woman feel worse than a slave. A woman works as hard in her sphere as the man does in his, and sometimes harder, and yet, as a rule, she has to ask for every penny, and when the husband dies, is entitled to the use of only one-third of his real estate, and now I see some legislators in New York State are trying to take even that away. Truly this is a cruel world.

AUNT HETTY.

ONE WIFE'S EXPERIENCE.

WHEN I hear domestic finances spoken of, I always think of what a lady told me of her experience when first married. When a child she had been used to having a little money that she called her own, and though it was but little, she felt very happy in its possession. Then she married at 16, and her husband having good business talents they soon acquired a good start in the world and every one pointed her out as a lucky woman. She had a pleasant home, a good husband, bright children and apparently everything that a reasonable woman could expect. But, although her helpmate was willing that she should have whatever she wanted, he deemed it a wise plan to do the purchasing himself, for at first she was young and inexperienced, and so he bought all her dresses, purchased all the household necessities and relieved her from the care of money in every way. Consequently, who can wonder that she suffered intense mortification when various little calls upon her purse found not one cent in it, and how gladly she would have sank from sight when little incidents would repeatedly come up to reveal the true state of affairs.

Whenever she went away from home for a fortnight's visit, her husband dutifully went to the depot and bought her a return ticket and sent her out into the world without a cent with which to help meet any contingency liable to make demands on her purse any day.

What chance had that woman in her life? What possible chance for her if her husband should die? He would leave her as unfitted to cope with business as an infant, thereby forcing upon her a double misfortune—years of torture from not being allowed an opportunity to gain experience, and an extreme helplessness should the entire management of the business be suddenly thrust upon her.

Let a man make his wife an equal partner and initiate her into the secrets of the business, and she will be ever ready to be a helpmate in preference to being a nonentity.

S. J. L.

MUTUAL RIGHTS.

SOME God-fearing women as well as men, suppose that a wife has no more right to take money from her husband's purse than she has to take it from any other person's. But Abigail was not denounced for taking of her husband's property—a large store too—even after he had declared that it should not be done, and sending it to David. In her wisdom, she foresaw that even *her husband's interests*, as well as the safety of them all, would be promoted by the outlay of the means he was too sordid to use. She was blessed for it; her act was their salvation. Indeed I have known no continued happiness or prosperity to attend cases where the husband held a tight grip on both ends of the family purse. But I fail to recall a single instance in which both parties conferred together about the outlay of their money, while each felt free to use it, where either had reason to regret it.

News of the Week.

HOME NEWS.

SATURDAY, May 11, 1889.

Old readers of the RURAL NEW-YORKER will recall the name of James A. Whitney. Twenty-odd years ago, before he became immersed in the profession of the law he was a standard authority on scientific farming in the American Institute Farmers' Club. He was bred a farmer and brought practical knowledge to the interpretation of science as applied to agriculture. In those days he was a frequent contributor to the RURAL. It was in the Farmers' Club, in 1870, on his return from a tour in California, that he first took strong ground against Chinese immigration, his views being subsequently formulated in his noted work on the Chinese and the Chinese Question, of which a second edition has just appeared. During the past few weeks his name has been prominently brought forward in connection with the United States Mission to China. We have known Mr. Whitney for a good many years and we believe that if he is appointed he will do honor to the position..... Out at Duluth the employees of a broom factory struck for higher wages the other day, whereupon the proprietor advanced the wages of the married, hands, and told the single ones that unless they were married within a month they would be discharged, whereas if they married their wages would be raised. Minnesota is bound to increase her population .....A bill legalizing the sale of pools on racing and trotting tracks in that State has been defeated by the Pennsylvannia legislature .....A colony of Belgians with a capital of $600,000 propose to settle in the province of Quebec.....The Massachusetts legislature has passed a bill providing that safe deposit, loan and trust companies doing business in that State, shall not invest in farm mortgages on land outside of New England and New York. The measure is directed principally against investments in Western farm mortgages which are considered too risky for the security of investors and depositors in such companies..... There appears to have been much exaggeration about the influx into Oklahoma, and the murders and lawlessness at the outset. Gen. Merritt, commanding the United States troops there, says the inrush was much smaller than reported, while it is hard to find a well authenticated shooting case. Many of the settlers are leaving in deep disgust at the character of the country in general, and their own ill-luck in getting fair locations. Town lots in Guthrie and other "cities" that sold readily for $100 each the first night, can now be readily got for $10. Provisions are abundant for those who have money; but pretty scarce, of course, for others. Gen. Merritt warns all immigrants not to attempt to settle in the Cherokee Strip and he has ordered a record to be made of all squatters so that they will not be allowed to make entries there when the territory is thrown open to settlement. Nearly all the people in the settlement in towns and country alike, still dwell in tents or covered wagons. Gambling appears to be the most profitable business in the towns; but the newly elected Mayor of Guthrie has notified gamblers to "go." The country is "settling down" fast. Plowing is going on on all sides, and great hopes are entertained of a marvelous harvest. Government inspectors are investigating the titles of land-owners with a view to canceling all fraudulent entries..... High license is to reduce the number of Boston "drinkeries" from over 2,000 to 780. The aggregate loss of those who have been refused licenses is estimated at $5,000,000 in fixtures and income..... The 28th International Convention of the Young Men's Christian Association was held in Philadelphia from May 8th to 12th inclusive.....High license came into force in Michigan May 1. Annual fee henceforth for selling spirits $600; for selling beer $500; brewers, wholesalers and distillers from $250 to $1,000. Druggists are stringently ruled in selling liquors..

Gabriel Dumont, Riel's chief lieutenant in the late half-breed rebellion in the Canadian Northwest, has been causing considerable trouble there since his late return from Dakota. He insists that the Dominion Government should pay for the damages during the rebellion, and another uprising of half-breeds and French-Canadians is not very improbable. .....In Lower Canada the breach between the English and French-Canadians is widening. Lately the province of Quebec voted $400,000 to compensate the Jesuits, in part, for property belonging to the order confiscated by the English when they took the country from the French. This excited the bitterest sort of opposition from Protestants not only in Quebec but in nearly all the other provinces, especially Ontario. An effort was made to induce the Dominion Government to exercise its prerogative of vetoing or "disallowing" the measure, but Sir John Macdonald refused to interfere. The animosity to which the thing gave rise or rather intensified still continues and is likely to become further imbittered by numerous differences in creeds, sympathies, aspirations, characteristics, methods and interests..... Tuesday last a tornado destroyed nearly all the town of Stafford, Kansas, killing three and injuring 30. The people saw it coming and most of them found safety in their cyclone cellars. Crops, farm houses and barns were swept away on a clearly defined northerly swath through Stafford and Rice counties.....Same day a tornado did a great deal of damage about Fargo, Dakota, and a "terrible wind storm" did ditto about St. Cloud, Minnesota.....The Johns Hopkins Hospital, consisting of 17 buildings and 1,200 feet of connecting corridors, and costing $2,050,000, was opened in Baltimore last Tuesday. It has 14½ acres of grounds and is the largest, most richly endowed and completely equipped hospital in the world. Instead of anything having been taken from the original endowment made 15 years ago, for building the Institution, $113,000 have been added to it, all the money having come from judicious investments of the principal. Quaker Johns Hopkins also gave Baltimore the splendid university which bears his name..... Frank W. Palmer, of Chicago, has been appointed Public Printer at Washington. Theodore Roosevelt, of New York, and ex-Assistant Secretary of the Treasury, Hugh S. Thompson, of South Carolina, have been appointed Civil Service Examiners. Both are strong supporters of the law.....Eight ailantus trees planted by Andrew Jackson in the grounds of the White House, and which have for years been a nuisance to the inmates owing to the malodorous character of their flowers, were cut down and cleared out the other day by order of President Harrison..... .....Arthur L. Thomas has been appointed governor of Utah..... The old Libby Prison having been bought by a speculative syndicate, is being transported from Richmond to Chicago on freight trains, the idea being to rebuild it in the Windy City just as it stood as a tobacco ware-house on its old site, and to make a pile by charging a "popular price" for admission to it as a show place. Tuesday a train loaded with parts of it was wrecked seven miles east of Nashville. Tenn., and the fragments were scattered in all directions. As many bricks and other fragments were secured as mementoes, it can never be rebuilt entirely the same as of old. Many object to the proposed perpetuation of this war memento.....Forest fires have done a world of damage to the woods and isolated farms, during the week, about Duluth, Minn; Wausau, Wis; and Ishpeming and East Tawas, Mich. and in a great many other places in the Northwest..... Near Cynthiana, Ky., Tuesday, $50,000 worth of horses were consumed by the burning of Captain Moore's stables.....A large number of Union Generals have been locating the lines of the various commands in the battle of Chickamauga, Tenn., on Sept. 19 and 20, 1863, with a view to securing the field for a national park, comprising about 12 square miles..... Large crowds of settlers in tents and "prairie schooners" are collecting along the Upper Missouri in the neighborhood of the Sioux Reservation in the expectation that 11,000,000 acres of it will soon be thrown open to settlement. Commissioners have for several years been hard at work to secure an agreement to that end between the government and Indians, and have almost completed their labor. The Oklahoma rush is likely to be outdone..... The new Inman Line steamship City of Paris has beaten all records in crossing the Atlantic from Queenstown to New York, having arrived at Sandy Hook at 8.15 A. M. Wednesday, after a voyage occupying exactly five days, 23 hours and seven minutes. On the fourth day out she traveled 511 miles—the longest day's run ever made. The Cunard Line steamship Etruria had made the fastest trip ever previously made across the Atlantic—in six days, one hour and 55 minutes. The City of Paris's time is therefore two hours and 43 minutes faster.....A switch engine on the Michigan Central Railroad last Wednesday evening demolished a street car crossing the track, and killed six women..... The Illinois Steel Company, is the name of a new combine, embracing the three largest steel manufacturing interests in Illinois, with a capital stock of $25,000,000, $18,000,000 of which have been paid in, chiefly in the form of buildings, machinery, etc., etc. The "plant" includes various mills in South Chicago, Joliet and Milwaukee, and mines in Dodge County, Wisconsin.....

A Proxy.

In our more exacting moods, when anything is presented for personal investigation we seem to expect our neighbors to try it first; and are willing to trust to the effect the trial has upon them. Gaining experience by proxy, this is, safe and selfish, but it often answers.

Since you demand a proxy, observe please, the subjoined testimony of a neighbor in regard to Drs. Starkey & Palen's treatment by inhalation.

NEWPORT, R. I., Jan. 23, 1888.

"I hardly dare tell you how wonderfully I have been blessed this fall and winter thus far, and how much I have been enabled to perform through God's blessing, attending the use of Compound Oxygen. I surprise myself almost every day in the amount of labor to perform in comparison to last summer; it seems almost a miracle to me. I have exceeded all my hopes of one year ago. I remain your grateful patient," MRS. LYDIA B. CHACE.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 120 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, May 11, 1889.

IN England the Parnell trial still excites most public interest. After the suicide of Pigott who confessed that he had forged the incriminating "Parnell letters" on which the trial was based, and that he had sold them as genuine to the outrageously credulous Times, it was thought that the affair must soon collapse; but the government and the paper had too much at stake to allow the matter to drop until all means should be tried to break the force of the exposure of their vindictiveness and credulity. Parnell has been on the witness stand during a part of this week and last, and with imperturbable coolness denied nearly all the charges made by the witnesses on the other side, and palliated the rest. The impression made by him on the public is quite good. The bye-elections have all along been, almost without exception, in favor of the Gladstonians.....This is an era of strikes in England as well as in most of the continental countries, especially in Germany, where as in France, a number of fatal collisions have occurred between the military and turbulent strikers at various labor centers. There, as here, and with much more reason, workingmen are disposed to insist on obtaining a greater share of the profits of their own labor. .....All the English dock-yards are working as hard as possible in making additions to Great Britain's already enormous naval forces. The country's ambition is to have a fleet as strong as the combined fleets of the rest of Europe; but as France, Germany, Russia and Italy, to say nothing of weaker powers, are also hard at work adding to their fleets, it is more than doubtful whether this can be done.....

AGRICULTURAL NEWS.

SATURDAY, May 11, 1889.

The auction sale of trotters at the American Institute building in this city, last week, was not a great success. The attendance was very small, and the prices obtained, low. The highest price paid was $200 for the bay gelding, Lawrence, and the lowest $165 for Lizzie King.....At the meeting in Chicago of the National Trotting Board of Review, the order was entered that judges have no power to modify or change rulings made during the progress of a race, later than the day upon which the result of the race was announced ... .On the farm of George J. Smith, in Princess Anne county, Virginia, during the gale of April 7, four acres of land began to sink, and are now covered with a lake of water five feet deep... D. La Scala, a fruit commission merchant of this city, has brought suit agaist L. M. Lyon of the Buyers' Union for $50,000 damages, and against eight other members for $5,000 each for alleged libelous statements regarding his manner of doing business..... Hard frosts were reported from eastern Pennsylvania the first days of May, and much damage is feared to fruit, as the trees were all in bloom..... ..Memphis, Tennessee is the largest interior cotton receiving city in the world, and is only exceeded in the amount of cotton handled by New Orleans. Up to May 4, there had been received at Memphis, since September 1, 700,201 bales, being 36,923 bales more than in any preceding year.....A Swiss workman has invented a method of making artificial boards that promises to become a success. The boards are made of a mixture of plaster-of-Paris and reeds pressed into shape by hydraulic process..... ..... A Buda Pesth inventor has devised a machine for felling trees. Electricity is used as a power. The machine does not work a saw, but a drill of peculiar construction which perforates the base of the tree with a series of holes. The axe is used only to finish the work ..... The Missouri Cattle Inspection bill applies only to places of 5,000 inhabitants and over. Those living in smaller towns may eat Chicago dressed meat even if it kills 'em..... ... A bill now before the Missouri legislature makes it illegal to sell grain or other produce for future delivery unless the sellers actually possess the goods at the time of sale. This would put a stop to all sales of "options" or dealings in "futures" and the St. Louis grain dealers and speculators say that if it passes, they will build an Exchange across the river in East St. Louis, in Illinois, and altogether abandon business in the Mound City. There's also a prospect of a Grain Elevator Trust in St. Louis, but it is thought likely that the legislature may interfere with the project..... The Governor of California has vetoed the appropriation of $10,000 made by the legislature for silk culture, on the ground that California cannot compete in that industry with China or Japan..... Two dairy shows will be held in connection with the forthcoming exhibition in Paris One is fixed to take place from the 4, to the 19 of May, and the other from the 13 to the 18 of September. Exhibitors will be obliged to take part in both.....It is proposed by the Government of Victoria, Australia, to establish several model dairy farms, and to fit them up with the most approved appliances. Pupils will be received at the farms and instructed in scientific dairying ..... Dr Salmon has issued from the Department of Agriculture a pamphlet giving a review of his five years' work in investigating the disease known as hog cholera. It is a big pamphlet containing little that is new and almost nothing that is in any way conclusive..... The New York Experiment Station concludes that there is a loss of butter when milk is allowed to cool much below the normal heat of the cow before going into the creamer. It also concludes that quality of butter is not injured by heating milk as high as 135 degrees. .....The Ohio Station has just issued a timely bulletin on injurious insects and how to kill them.....Prof. Sanborn, of the Missouri Agricultural College, who has been having trouble with the Board of Curators of the University, presented his side of the controversy in the hall of the House of Representatives, a synopsis of which has been issued in pamphlet form.....A report comes to us all the way from Scotland, that four ewes belonging to a Mr. Scott of Kincardineshire, had just dropped 13 fine healthy lambs..... The American Jersey Cattle Club has just issued Vol. XXVIII. of its Herd Register. The number of bulls is carried from 20,001, to 21,000, and that of cows from 49,001 to 51,000. ..... A meeting of the Iowa Jersey Cattle Club is called at Davenport, Iowa, Wednesday, May 22..... Peter Henderson has been mentioned by several New Jersey papers for Governor of that State .. .. Chicago florists report a falling off in the Easter demand for Callas.....Tulips, also, are not in as brisk demand as formerly, in all the large cities. The flower for some reason seems to be losing its popularity..... Chicago receipts of live stock for April this year are 224.000 cattle, 361,000 hogs, 130,000 sheep, and 7,800 horses, against 182,015 cattle, 380,792 hogs, 110,455 sheep, and 5,159 horses for April, '88. The prices for the two years are about as follows:

	1888.	1889.
Texas Cattle.....	$4.00 to 4.37½	$3 95
Sheep, best.....	5.75	5.15
Hogs, heavy.....	5.35 to 5.55	4.65 to 4.85
Hogs, light.....	5.30 to 5.45	4.60 to 4.75

The Department of Agriculture reports the average condition of horses throughout the country as 98.4, a very high average..... Ex-President Cleveland's seal-brown horses, together with his carriages, harnesses, and stable paraphernalia, were sold at auction in Washington, May 6. The seal-browns which were said to have cost Mr. Cleveland between $600 and $700, sold for $141 each, and the other property sold at equally low prices..... The Florida Fruit Exchange met at Jacksonville, May 8, for the election of officers, and other business.....As Secretary Rusk was passing some laborers who were engaged mowing the first crop of grass in the grounds of the Department of Agriculture, he seized a scythe and gave them some "points," rapidly cutting a wide swath amid the plaudits of the crowd which had gathered.... .....It is said that 1,034,000,000 eggs were imported into England last year.....During 1887—88 England imported 1,300,000 tons of sugar. Of this amount, 372,000 tons were crude beet sugar, 315,000 refined beet sugar, and 581,000 cane sugar..... The Russian beet crop of last year produced 500,000 tons of crude beet sugar.....The suggestion has been made to make sugar barrels of the refuse bagasse of the Louisiana sugar factories.....An English breeder of Herdwick sheep claims that five out of every six they have killed have an extra rib. .....It is reported that one of the largest flouring mills in Canada has suspended operations owing to the high price of wheat..... For the week ending April 13; the number of foreign beef cattle sold in London was 2,005, of which 1,427 or more than two-thirds were from the United States. The receipts at other ports were also large..... .....The prices of flour for supplying the various Indian agencies are somewhat higher than last year, ranging from $1.73 to $4 23 per 100 pounds ..... The State Straw Wrapping Paper Manufacturers' Association recently in session at Albany, took measures to lessen the manufacture of straw wrapping paper..... Copious rains during the past few days have greatly benefited wheat and other crops all through the West, where they were beginning to be seriously affected by drought..... William M. King, of Ohio, chief of the seed division, Agricultural Department, has resigned, and A. T. Reeve, of Hampton, Iowa, has been appointed to fill the vacancy. The salary is $2,000..... .....W. W. Cooke, of Medicine Lodge, Kansas, has been appointed special agent of the Agricultural Department in charge of sorghum sugar experiments..... William Sims, of Topeka, has been appointed State agent for Kansas of the Agricultural Department.....The Michigan Experiment Station has issued a bulletin discussing potatoes, kale, squashes and tomatoes. The Alabama Station reports experiments with cotton, pigs and cattle.....Several of the stations are making comparative tests of the various appliances used in raising cream. Tests of the various churns will follow. The New Hampshire station started this movement.....15,000,000 bushels of wheat were on hand in Southern Russia, April 1, against 5,000,000 bushels last year..... A Georgia man has planted 45 acres of tomatoes this spring..... The consumption of peanuts is placed at 3,000,000 bushels per year.....A cargo of 27,000 bushels of South American flax seed has been received for a Chicago crusher ....England is now getting most of its ice from Norway to the injury of the American trade..... Three and one-half times as much corn were shipped from New Orleans during the month of April as during the same month last year.....

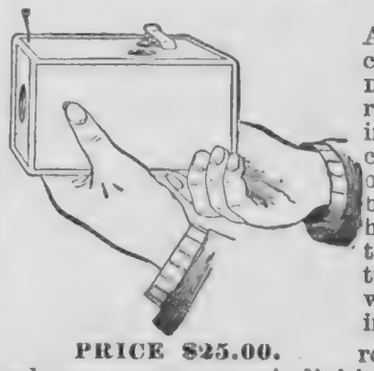
The Kodak.



PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be reloaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker

The Eastman Dry Plate and Film Co.

ROCHESTER, N. Y.

FOR A DISORDERED LIVER try BEECHAM'S PILLS.

Dr. WM. H. THOMPSON of the University of the City of New York says: "The symptoms of diseased kidneys will first appear in the extremely different organs of the body. Treat the kidneys and not the effects of kidney disease, by using Warner's Safe Cure.

WILLIAM ROBERTS, M. D. F. R. C. P., of the University of London, Eng., says: "Passive congestion of the kidneys may be present, in which the urine contains not a trace of albumen, while the symptoms of intense venous congestion, dropsy, orthopœna and pulsating jugulars are present. The urine becomes scanty, high-colored and dense." Warner's Safe Cure, has cured thousands of these symptoms, often called diseases, by putting the kidneys in a healthy condition.

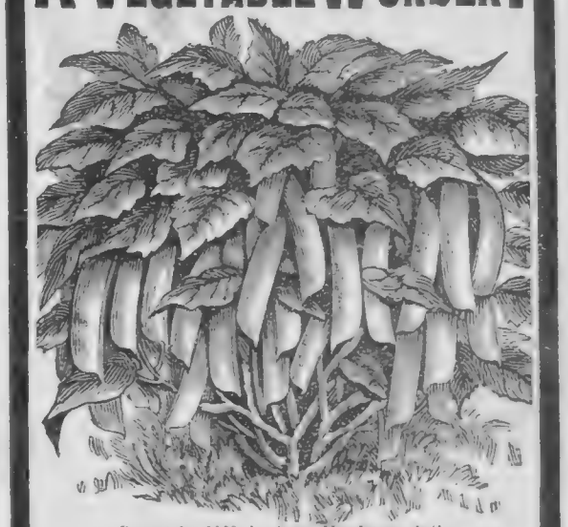
A VEGETABLE WONDER!



Copyright, 1888, by Peter Henderson & Co.

HENDERSON'S NEW

BUSH LIMA BEAN.

Can and Should be Grown in every Garden on the Continent.

Of all the *Novelties* in *Garden Products* ever sent out, there is nothing so entirely distinct and valuable as this *New Vegetable*. The old Lima Bean can only be grown on poles, while the *NEW BUSH LIMA* grows and is cultivated exactly like the common bush or snap bean (growing only 18 inches high), and from the time of its bearing in July, produces in abundance delicious Lima Beans throughout the entire season until frost. It has, besides, an additional value, in that it is *two weeks earlier* than any other Lima Bean, being fit for the table in from forty to fifty days from time of planting.

Price (by mail) 25 cents per packet, 5 packets for $1.00, 12 packets for $2.00 (12 packets sufficient for an ordinary-sized family for the season). Directions for growing on each packet. Remittances can be sent either by Post Office Order, Postal Note or Stamps.

$100.00 in Cash Prizes for single plants bearing greatest number of pods. For conditions see Manual offered below.

Every purchaser of *Henderson's Bush Lima Bean* will be sent, *without charge*, our MANUAL OF EVERYTHING FOR THE GARDEN, a book of 140 pages, size, 9 x 11, containing 3 colored plates (the price of which is 25 cents), *on the distinct understanding*, however, that those ordering will say in what paper they saw this advertisement.

BREED'S UNIVERSAL WEEDER and CULTIVATOR

For Weeding and Cultivating all hoed crops. For putting in Grain and Grass and Hungarian or Millet it has no equal. Every farmer should inquire into its merits. Ex-Gov. ROBIE, Master Me. State Grange, writes: "It should be owned by every farmer in the country." Send postal card for circulars and testimonials. All parties in Middle States should address BROWN MFG. CO., 40 DEY ST., NEW YORK. All others UNIVERSAL WEEDER CO., North Weare, Hillsboro Co. N. H.

Literary.

OUR FIRST FARMERS' INSTITUTE.

BY WM. ROSS.

CHAPTER VI.

THE institute boom was now well up, and there was nothing to do but to keep it booming. Without saying anything about it, President Bark volunteered to attend to advertising the institute himself. He had had some experience in this line, and he brought this into use now, with any new ideas he might pick up. The National election, with its excitement over, the editors were all very willing to get items, with which to spice up their columns, that did not cost them any labor of their own. Each week there appeared in all the papers more or less laconic items in reference to the farmers' institute, setting forth the time of meeting; the character of an institute; the names of speakers assigned; praising their qualities, and their standing; the importance of institutes; what could be learned; who should attend, inviting the ladies. Every new feature was promptly given; and the nearer the time of meeting approached, the more of them appeared till it almost appeared that the supply was inexhaustible. All these went into the papers as ocal news items, scattered over the home-news page, so that no person could read very much on that page without running upon something about the farmers' institute. The people soon got to thinking that there must be something wonderfully nice about an institute, when all the papers were praising it so, and soon everybody seemed to be talking institute. The total cost of advertising was two dollars. Nothing occurred to mar the harmony till within a week of the institute, Sec. Toes received the following letter from Mr. Brown;

Oxford, O., Jan. —, 18—.

Mr. Toes,

Dear Sir: Mr. Bonham has changed my appointment and will send John Gould to your institute, in my place. Respectfully,

W. F. BROWN.

Frank came to town, and met Bark, who was just leaving the office of the only newspaper that would be out before the institute met, where he had left an unusual supply of institute locals, praising the eminent speakers, etc., as usual. Frank handed him the letter and unburdened his mind of certain expostulatory sentiments, while Bark read it, and reflected a little.

"Let's go into the office and see Clarence," said Bark.

"We don't want Gould," said Frank. "If they had sent him here at the start it would 'a bin all right, but we've worked this institute up for Mr. Brown, and now we want Brown, or nobody. We'll write right up to Bonham and tell him we don't want Gould."

"Oh! that won't do!" said President Bark. "Bonham can do as he pleases, and on the principle that 'beggars should not be choosers,' we'd better not insult the Institute Committee or we'll get nobody sure."

"We're not beggars in this thing; we pay our taxes as well as other people," said Frank; "Gould's subjects are all dairy subjects, and we are not running the dairy business here. We've been telling the people that Brown would be here, and they'll think we've been lying to them, and I don't propose to stand it."

"You can say what you please to these fellows, on paper," said Mr. Grady; "and they'll just turn round and laugh at you, and then do as they please."

"I think those speakers are sent at the expense of the Board of Agriculture, and not much, if any, of the money, perhaps, is raised by taxes, and I think we will do better not to be too fast." replied Bark. "This is awfully aggravating, I know, when we've everything in good shape to have it all knocked wrong—too late to right it too. But I think if we write a genteel protest to Mr. Bonham, it will be better."

"They were very particular about us asking a change," said Frank, "but it's no trouble for them to make a change and ruin us, when they want to."

"I'll write a letter," said Mr. Grady, going to the desk and getting pen and paper; "Now what do you want me to write?" he asked Mr. Bark.

"Well, just write that the change in speakers at this late date, is very unsatisfactory, as we have no chance now to satisfy the people, and they'll think we've been fooling them, and Mr. Gould's subjects are not so popular here as Mr. Brown's, or something to that effect."

Mr. Grady wrote the letter;

"I think that's strong enough," said Bark.

"I think so too," replied Clarence.

"Well, that's all right," said Frank.

They felt the chagrin too keenly to make any corrections in the paper above referred to, as that would do but little good, and possibly might do harm, for no one knew how many there might be, like Toes, that wanted Brown or nobody. It was thought the proper thing to do was to wait developments, and make a public explanation at the institute, if necessary, exonerating the local committee, which could easily be done.

Fearing, however, that the protest might be construed to mean too much, Mr. Bark sent a letter so as to meet the speakers on their way, stating, that if the change had to be, we wanted Mr. Gould, and wanted him badly.

CHAPTER VII.

On the opening morning of the institute some of the managers met the speakers at the station. After the usual self-introductions, Mr. Brown was introduced.

"You received a letter from me, I suppose," said Mr. Brown, "that I was not coming, but I afterwards received a telegram for me to come on and fill my appointments out here."

"We are very glad you did," said Mr. Bark, "for there would have been quite a disappointment if you had not come."

As the people in general heard nothing about the late unpleasantness, none but the managers had to undergo a change of feeling, and soon all were feeling good again.

The New Agreement choir came. The President gave the leader certain signs by which he would know when to prepare to sing.

Promptly at the hour set, the institute was called to order.

Mr. Edwards saw "more than he expected," for the bar soon filled up.

The choir sang "Praise Ye the Lord,"

A minister read, and invoked a blessing on the institute.

The choir again rose and sang.

A short welcome address was delivered *ex tempore*.

Here was an oversight already apparent. There were no means provided to catch speeches "on the fly."

The President replied, in behalf of the Institute, in well chosen words, to disseminate the very best of feeling, among the residents of the town and the farmers, who may attend the institute.

Mr. Brown addressed the assembly on "Farmers' Clubs."

The choir immediately rose and sang "Don't Leave the Farm, Boys."

There being no response to the first topic in the programme, the second was called. "How to Retain Fertility in the Soil." The local talent came out on this with vim. The hour to adjourn came, and the choir was ready to sing again, but the discussion went on. At last the President said "Gentlemen the hour for adjournment has come, the choir may hold their piece for opening."

"Let them sing now and then at opening too," said somebody in the audience.

(To be Continued.)

MAGAZINE NOTICES.

THE CENTURY for May devotes considerable space to Samoa, which is a subject of peculiar interest at the present time. Harvey W. Whitaker who has made a prolonged visit to these islands gives a very entertaining and instructive description of their situation and importance, their government, religion, language, customs, etc. The Samoans are very hospitable, polite and honest, are a fun-loving people, and very fond of singing, dancing, and aquatic sports. Their principal occupations are fishing, collecting copra, planting taro, cultivating fruits, and making cloth from the inner bark of the mulberry tree. The article is profusely illustrated with views of different parts of the islands, the United States consulate at Apia, houses and canoes, and a very good illustration of King Malietoa and a native orator.

Our relations to Samoa are also discussed by George H. Bates, the commissioner sent to Samoa by the United States in 1886. This country possesses treaty rights of the utmost value, including the opportunity to control the most magnificent harbor in the Pacific, the loss of which to the British Empire was long ago bewailed by the most intelligent Englishmen. The Tuscarora's Mission to Samoa is also given by Henry Erben.

Other interesting articles are Roby's Christian Charity; Round About Jerusalem, profusely illustrated; Salome Müller, a story of Louisiana; A Ride Through the Trans-Baikal; Tom's Strategy, a Negro story; Recollections of Jean Francois Millet, with portrait, and specimens of his drawings; The Monasteries of Ireland; The Western Soldier, and others. The papers on Abraham Lincoln are continued, giving a history of occurrences during the most exciting period of the Civil War.

The Pansy for May, is as bright and cheery as the flower from which it is named, and will give a world of pleasure to the young people for whose benefit it is published.

CATALOGUES ETC., RECEIVED.

STEEL CASE REVERSIBLE LEVER PRESSES.—The elaborate catalogue of P. K. Dederick & Co. of Albany, N. Y., contains a full description of the latest thing in hay presses. It seems to the R. N.-Y. that the steel press shown at Fig. 119, is destined to revolutionize the hay-baling business. The use of the steel case enables the manufacturers to make a press that is smaller, lighter, stronger and more durable than the wooden presses of former years. The press that we show is a great favorite with farmers and small balers. It may be driven by steam or water power, tread or lever horse power, or, in fact, by anything that will communicate power by belt. It can be worked in any part of a building and its compact size enables it to fit into many a convenient place that a larger press would not enter. Further particulars regarding this press are given on page 344. For full information our readers are referred to Dederick's catalogue.

"STRICTLY GENUINE STEEL ROOFING"—Catalogue from the Kanneberg Roofing Co., Canton, Ohio. This pamphlet is designed to show, in a comprehensive manner, the various uses to which this roofing can be put. It is a bright and reliable pamphlet which can be easily understood. The goods made by this house will be found first-class in every respect.

EUREKA MOWER COMPANY, UTICA, N. Y.—The Eureka differs from all other mowing machines in that the cutter-bar is directly behind the horses. This enables a team of horses to handle the six-foot-cut with ease. The circulars sent out by this company are very handsome, and illustrated so that any one can see at a glance the points of excellence which characterize the Eureka. Send for them.

WHITMAN AGRICULTURAL COMPANY, ST. LOUIS, MO.—Circular of hay, straw, wool and cotton presses. The Whitman presses are used in all parts of this country and a large number of them have been exported. The Belt Power machine is the most perfect yet invented. The Full Circle Steel press is one of the marvels of the century. The Horse Lever press is used everywhere. It is claimed that the Whitman presses have taken the first prize wherever exhibited. Send for the circular.

GEORGE ERTEL & CO., QUINCY, ILL.—Circular of their Automatic Folder Double-Acting Perpetual hay and straw press. This circular contains a large number of testimonials which go to show that the Ertel Victor gives unbounded satisfaction in that it is one of the best presses made. Send for this handsome 32-page catalogue.

ACME HAY HARVESTER CO., PEORIA, ILL.—Circular of the "Acme" Hay Stacker and Sweep Rakes. It is claimed that these implements will enable one man and two boys to put up 30 tons of hay in one day. Send for this circular and other information concerning the gathering and bunching of hay.

"THE AMERICAN" HAY TEDDER.—Circular from the Ames Plow Company, Boston, Mass. This is a good tedder and will doubtless satisfy those who use it.

ON THE PRODUCTION OF LEAN MEAT IN MATURE ANIMALS.—In bulletin No. 5 of the Experiment Station, at Cornell University, we are given the results of a very interesting experiment. As every one knows, who buys pork, it is exceedingly difficult to obtain lean meat. The pork for sale in the markets and at the stores is all too fat. A few days ago the writer tried to buy a piece of lean pork to be used with baked beans, but it was impossible to find a piece containing more than a mere streak of lean. This fact is so plainly evident that it is not at all strange that some of the wisest of our agricultural scientists have put themselves to the task of proving that lean pork is a profitable possibility.

Professors Henry, Sanborn and Roberts have conclusively shown that the relation between the lean and the fat in the carcass of young animals may be varied by varying the relation between the nitrogenous and carbonaceous matters in the ration fed. That is to say, the feeder has it in his power to increase the proportion of lean meat in pork when he can start with the young pig. But many persons have insisted that the same difference could not be produced in the mature animal whose muscles have been formed. Prof. Roberts determined to test this point and the result of his test appears in this bulletin.

Two grade Yorkshire sows, three and four years old—one the mother of the other—were selected for the experiment. These were much alike in flesh and general condition. One was slaughtered at once and her carcass cut up and rendered so that the total weight of bones, fat, protein, etc., etc., could be determined. The other was fed for 143 days on a ration designed to supply all the nitrogenous or "lean-making" food she would eat. At first this ration consisted of four pounds of wheat bran, two pounds of cotton-seed meal and two pounds of shelled corn per day. After a few days' feeding the sow refused to eat so rich a ration and the cotton-seed meal was lessened. She would take hardly any for a time, but at last she was induced to eat one-half a pound per day. During the entire period she ate 327¼ pounds of bran, 83 pounds of cotton-seed meal and 247 pounds of corn. The following table gives the result of the test. No. 1 is the sow that was killed before feeding, and No. 2 the one that was fed for the production of lean meat.

	No 1.	No 2.
Live weight	207.	296.
Dressed weight including kidneys,	131.	211.
Bones, lbs.	13.	16.63
Total protein matter, lbs.	18.10	59.09
Total fat, lbs.	16.70.	48.29
Per cent. protein in carcass.	13.82	28.
Per cent. fat in carcass.	12.75	22 89
Per cent. dressed to live weight.	63,29	71,28

It is seen from this that the special feeding resulted in a large increase of lean meat—protein. In hog No. 1 there was but about 14 per cent. of lean meat, while hog No. 2 showed 28 per cent. To make the matter still plainer, we give at figures 117 and 118 pictures of the meat from the hog fed for lean meat and that from some hogs sold in the Ithaca market. These hogs were fattened by farmers in the ordinary way, largely on corn alone, and were about the same age as the experiment hog. The meat from the specially fed hog is shown at the top of each picture, the two lower cuts in each engraving are from hogs as offered for sale in the market. We are not giving any figures as to the comparative cost of this lean meat. Speaking from the customers' standpoint, we can only say that we would willingly pay an extra price for meat like that shown in the upper cuts. We know that there are enough more of the same mind to warrant a farmer in making a business of producing such pork.

A. A. MARKS, 701 BROADWAY, N. Y.—Circular of Artificial Limbs with Rubber Hands and Feet. The enormous increase in the number of accidents at railroad crossings has resulted in a large demand for artificial limbs. This increased demand has led to many improvements, chief of which are the rubber hands and feet. A number of the victims of last winter's blizzard were supplied with artificial limbs; one of them, Miss Lois M. Royce, writes:

"The artificial feet fit so far admirably and I walk very well with them. I walked to the carriage this afternoon just by taking hold of my father's arm."

STANDARD HAY TOOLS.—Catalogue from the United States Wind Engine & Pump Co., Batavia, Ill. The hay carrier and fork made by this company will be found well worthy a trial. A most complete outfit of horse hay tools can be furnished, and the company take pride in producing the best that can be made. Besides the hay tools will be found a description of the famous Halliday pumping mill, with tanks and pumps of all sizes. A good house to deal with.

Miscellaneous Advertising.

MANLY PURITY AND BEAUTY

CUTICURA REMEDIES CURE SKIN AND BLOOD DISEASES FROM PIMPLES TO SCROFULA.

NO PEN CAN DO JUSTICE TO THE ESTEEM IN which the CUTICURA REMEDIES are held by the thousands upon thousands whose lives have been made happy by the cure of agonizing, humiliating, itching, scaly and pimply diseases of the skin, scalp and blood, with loss of hair.

CUTICURA, the great Skin Cure, and CUTICURA SOAP, an exquisite Skin Beautifier, prepared from it, externally, and CUTICURA RESOLVENT, the new Blood Purifier, internally, are a positive cure for every form of skin and blood disease, from pimples to scrofula.

Sold everywhere. Price, CUTICURA, 50c.; SOAP, 25c. RESOLVENT, $1. Prepared by the POTTER DRUG AND CHEMICAL CO., Boston, Mass.

Send for "How to Cure Skin Diseases."

Pimples, blackheads, chapped and oily skin prevented by CUTICURA SOAP.

Rheumatism, Kidney Pains and Weakness speedily cured by CUTICURA ANTI-PAIN PLASTER, the only pain-killing plaster.

Field Crops.

HAY.

(*Continued from Page* 336.)

pounds of seed per acre in oats. This season he intends to seed more ground by sowing the seed in rye, and using the rye for soiling, which will leave the ground to the Alfalfa as soon as it is large enough to need all of the space. The rye will shade the young plants and protect them from the wind which injures the plants when young if the ground is left smooth, and there is nothing to protect them. This injury by the wind is probably due to the fact that there are very few fine roots to hold the plants in place when young. The single, thread-like root that each plant sends straight down, is not sufficient to keep it from being twisted and injured by the wind.

Some have advanced the idea that Alfalfa is especially adapted to sandy soil. This is true, no doubt, but it is also true that this plant will appreciate good, rich, heavy soil as well as any other plant of this nature.

An acre of Alfalfa was sown on the college farm last season on a piece of ground where sand predominates. It came up nicely and made a fair growth during the season, although the dry weather in August killed some of it where the soil was most sandy. It did not come through the dry weather any better than our common clover. I would recommend more than 20 pounds of seed rather than less. When sowed thinly, it grows too coarse and rank and will not make hay of as good quality as if it had been sown more thickly. Bulletin No. 47, Michigan Experiment Station, gives some notes on Alfalfa which is being grown on the farm. H. T. F.

Agricultural College.

FROM NEW JERSEY.

THE grasses grown by us are Timothy and Red clover. We generally sow on wheat or rye. I have always favored early cutting. I believe the hay is better relished by the stock and it is certainly more nutritious. To secure our hay crop all in due season, we must commence cutting early. Every one uses a mower, horse-rake and horse hay-fork whenever it is possible. We also use a hay tedder to assist in curing the crop.

As a general rule, we seed down once in five years; sometimes once in four years, with wheat or rye—Timothy in the fall, at the time of sowing grain; clover in the spring, generally during March.

Ours is a good hay country; but it is difficult to state the average yield. Last year I cut of clover and Timothy, mixed, rising two tons per acre, and of Timothy about 2 1-2 tons.

The productiveness of our section in grass was much increased by the application of sand marl; but of late years fertilizers are taking the place of marl.

We have not used any marls for 18 years—and are producing larger crops of hay than at any former period. By making and using all the yard manure we can, and liberally adding chemical fertilizers, we can grow maximum crops of grass when the conditions of moisture are right. Where we mow more than two years, we always top-dress in the spring, and by so doing we have in some cases, doubled our yield of hay. The manures should be applied as early in March as we can get on our fields. It's wonderful what a change is produced by those spring applications. D. C. L.

Middlesex County.

FROM PENNSYLVANIA.

1. CLOVER and Timothy are used here for hay. The crop is cut early before the seed fills, because the hay seems to give better results when fed on the farm and sells better in market, and we get a better after-growth to protect the meadows in winter.

2. I prefer the Eureka mower which is growing in favor; but I think the majority use the new model Buckeye. There are many other machines in use. The Tiger rake is most used, and single and double harpoon forks.

3. We re-seed once in three or four years without any grain crop, generally early in March.

4. The average yield is about one ton per acre. Farm manure is chiefly used.

5. Farmers are beginning to experiment with new grasses.

6. Productiveness is best increased by plowing and seeding often, top-dressing in autumn with farm manure, and never pasturing meadows. Of late I have been raising one crop of grain or potatoes, then I have plowed and harrowed the ground late in the fall, and sowed it to clover and Timothy in March. In this way I have succeeded in keeping clover two winters on ground so clayey and wet that a fence post will not stand more than three or four years. L. W. Mc E.

Wilawana.

1. WE grow for hay mostly Timothy and clover. We cut clover early if a crop of seed is expected, and Timothy when in full bloom.

2. The Champion and Mc Cormick mowers are the favorites. Hay rakes of different kinds are used, the Tiger being considered one of the best. We use hay carriers of several kinds; the King's Improved is one of the best. Hay tedders and loaders have not come into general use.

3. We generally seed down after a rotation of corn, oats and wheat. The grass seed is sown with the wheat. Timothy is sown in the fall along with the wheat; clover in the spring from about April 1 to 15.

4. The average yield per acre is probably about 1 1-2 to two tons. Barn-yard manure has been the stand-by, but commercial fertilizers are giving good results and are rapidly coming into general use. Lime is also used, but is not considered much of an enricher of the soil, but on land where it has not been used to excess it will give enormous crops of grass and especially of clover.

5. No new grasses have been tried in this vicinity. As substitutes for our ordinary kinds, Hungarian grass, millet and fodder corn are generally used.

6. We think the best way to increase the hay crop is to have the land well drained, plow deep, harrow once, so as to level the ground, and then apply from 100 to 200 bushels of stone lime per acre, as there is mostly plenty of organic matter in the meadows for the lime to act upon. Of course, barn-yard manure is beneficial in almost any quantity, and an application of commercial fertilizer every spring will be found of great benefit.

Fannettsburg. R. W. Mc A.

1. IN this section clover and Timothy are the principal grasses grown for hay. The best time in my experience for cutting clover is when about half of the heads have turned brown. Timothy should be cut just after the blossoms have dropped; if cut earlier, the hay will have have a bitter taste when cured; if left later it will be hard and woody; in either case the stock will not relish it so that there will be a waste in feeding.

2. Of mowers we use almost as many kinds as there are makes. I prefer the Eureka direct draft; it is light-running, considering the width of the cut, (six feet) and easy to operate and it leaves the grass in good shape to dry. Other tools in general use are the Bullard hay tedder, the Tiger horse-rake, the double harpoon hay fork, with a carrier at the top of the barn for unloading by horse power.

3. We follow the four-year rotation: first, corn, next oats, followed in the fall by wheat or rye, the Timothy being sown at the same time and the clover the following spring among the growing wheat, to be cut the following year for hay. The first cutting is principally clover, the next year mixed hay, the third year the clover will have about all disappeared, leaving the pure Timothy.

4. The average yield per acre is about 1½ ton, varying much in accordance with the condition of the soil and the stand of grass. Manure is seldom used for the grass alone, it being dependent on the manure used on the wheat—mostly stable manure, with from 200 to 400 pounds of some kind of commercial fertilizer applied with the drill at the same time the wheat is put in.

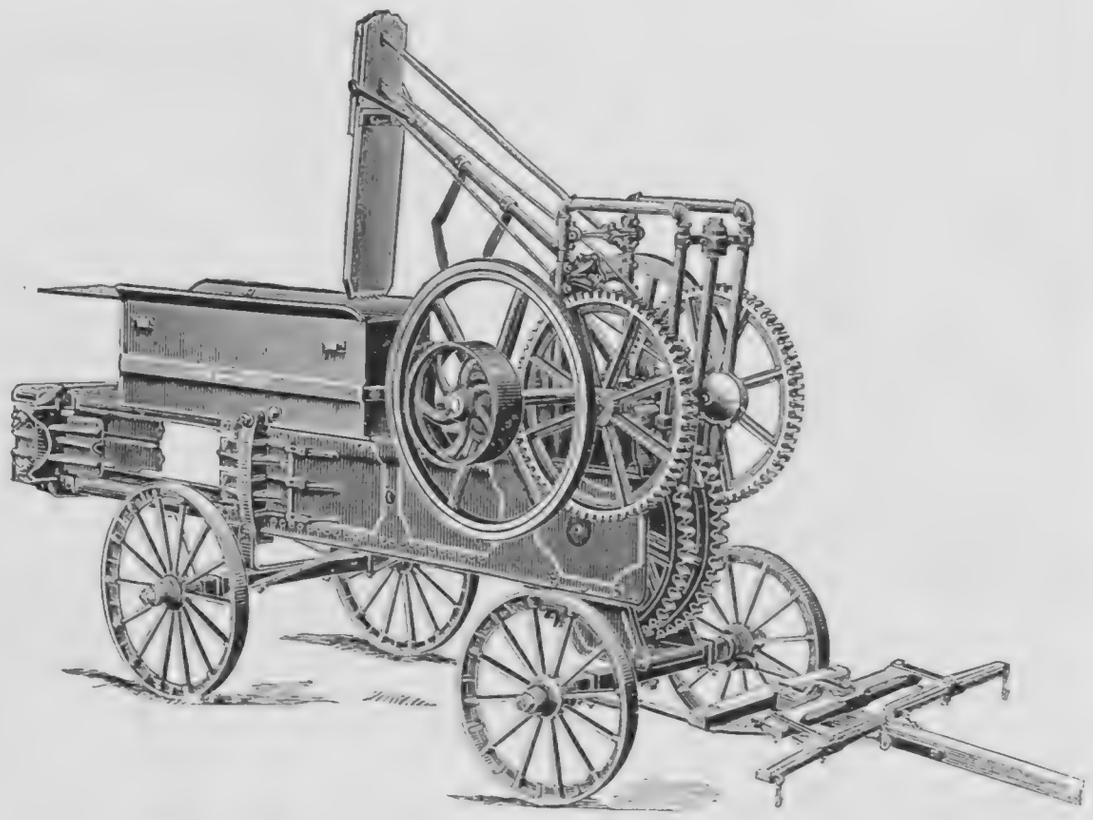
5. No new grasses or substitutes for old kinds are used.

6. A good application of stable manure, or a mixture of rock and bone applied early in the spring is one of the best ways to increase productiveness. H. T.

Delaware County.

FROM MISSOURI.

Timothy and clover are the main grasses used for hay here, with some little prairie grass saved by a few yet, and some Red-top. Timothy is more in use than any other, and most of the farmers mix clover at the rate of three parts of Timothy to one of clover, and if they do not pasture too closely in the fall, in a short time the clover will take the meadow, as I never saw clover freezing and heaving out of the ground as it does on clay lands. Red-top is but little used and when it gets started in a meadow it is hard to kill out. Prairie hay is counted the most wholesome hay for horses, but more grain should be used with it. I favor early cutting for Timothy. I want to commence to cut as soon as most of the blooms have fallen off, and I begin to cut clover when about one-half the blooms have turned brown. Prairie hay may be cut any time between the middle of August and the first of October, as it keeps growing till frost comes. My reason for the early cutting of hay is that the substance is in the stem then, and has not gone to the grain. After it has done this, the stem becomes woody and the seed shatters off and we lose the best of the hay.



STEEL CASE REVERSIBLE LEVER PRESS. Fig. 119.

The best mowers manufactured are in use here, and spring tooth hay rakes, and the largest farmers use two-horse rakes that take the hay from the swath, haul it to the stack-yard and deliver it to the hay stacker which throws it on the stack. With two such rakes and a hay-stacker and six men they can stack from 20 to 25 acres per day. The hay-fork is used considerably also, and some cut and shock their hay and use ropes and a horse to haul the hay from the shocks to the stack or barn. There is no regular date for changing meadows, as they appear to stand for several years, and do as well all through as when first started. I have a Timothy and clover meadow that has been set for at least 12 years, and last year it did as well as any other year, or better. I have had the best results by seeding with oats, sowing the seed immediately after sowing the oats. Most of the farmers here sow the ground to oats or millet and then sow the Timothy seed as early in September as possible, and the clover seed the next spring. Red-top will seed at any time, and we get more of it than we want, and guard against it all we can. The yield per acre is affected by the season more than by any other cause. Last year considerable ground made about two tons per acre, but that was a good hay year. We might count on about one and a half ton per acre as an average. Considerable millet is sown here for hay for cattle. What is known as the common or dwarf and the German millets are used exclusively, and they are sown about from corn planting time till the first of July, and cut for hay about the time the seeds are about half formed or in the milk state, and handled as other hay. The yield is from one to three tons per acre.

THE OUNCE OF PREVENTION.

UNDER the above heading the New York *World* of Feb. 10th, contains an editorial, of which the following are a few extracts:

"Physicians and unprofessional men of sense agree that if people would take a little of the pains to prevent disease that they do to have it cured, the civilized world would be much less like a vast hospital than it is now. * * * * But the idea of a regular and stated physical examination, even of persons who are apparently well, is an excellent one. The approaches of pulmonary complaints, kidney troubles, and many of the other ills that flesh is heir to, are so insidious as not to be apparent to their victim. * * * * In nothing is it truer than in disease that 'an ounce of prevention is worth a pound of cure.'"

There is a great deal of wisdom in what the *World* remarks. Individuals, as a rule, do not give their physical welfare attention, and it is only when alarmed by the presence of disease itself—the consciousness of failing strength—that attention is given to such matters.

Much has been said and written in recent years concerning the extreme and oftentimes fatal danger which results from delay in the treatment af kidney diseases.

Physicians admit that they cannot control advanced disease in those organs, and it is doubtful whether they can control it in any stage without the assistance of Warner's Safe Cure, which is established as the only known means which will reliably prevent and cure this class of disease.

Besides, it has been definitely ascertained that kidney disease is the real cause of ill-health in most cases where consumption, heart, brain or nervous disorders are supposed to exist, and in consequence of such belief many fatal mistakes have been committed by our best physicians in treating such disorders which are but the symptoms of the disease, whilst they have allowed the real disease—disease of the kidneys—to escape their notice until too late.

There is no safer or surer way by which health can be preserved and disease averted than the occasional use of Warner's Safe Cure, which will benefit the "engines of life,"—the kidneys, even if they are in a normally healthy state; while the good that will result in case disease is threatened, or is already present, cannot be over-estimated.

The most careful examination made by a skillful physician sometimes is unreliable, since this class of disease is extremely deceptive, and seldom openly manifests itself until the unsuspecting sufferer is beyond assistance.

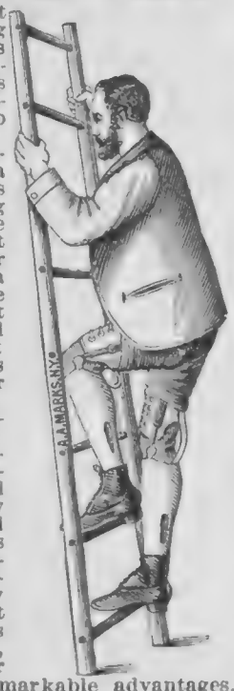
LEGS AND ARMS

WITH RUBBER FEET AND HANDS.



Although a man may meet with the misfortune of having both his legs severed from his body, he is not necessarily helpless. By having artificial legs applied, with rubber feet attached he can be restored to his usefulness.

The engraving is from an instantaneous photograph of a man ascending a ladder; he has two artificial legs substituting his natural ones, which were crushed by a railroad accident and amputated. With his rubber feet he can ascend or descend a ladder, balance himself on the rungs, and have his hands at liberty. He can walk and mingle with persons without betraying his loss; in fact, he is restored to his former self for all practical purposes.

With the old methods of complicated ankle joints these results could not be so thoroughly attained. Over nine thousand in practical use, scattered in all parts of the world. Many of these have been supplied without presenting themselves to us, simply by sending measurements on a copyright formula which any one can easily fill out. The press, eminent surgeons and competent judges in many parts of the world, have commended the rubber foot and hand for their remarkable advantages. Awarded the highest prizes at every competitive exhibition. Indorsed and purchased by the U. S. Government. A treatise of 400 pages and copyright formula *sent free.*

STOCKBRIDGE CORN FERTILIZER

Photograph of a Field of Corn raised on Stockbridge by J. B. Griffiths & Sons, Newmarket, N. H. Yield 400 baskets from 2⅛ acres.

The introduction of the Stockbridge Corn Manure in 1876, by Prof. Stockbridge of the Massachusetts Agricultural College, gave a great impetus to New England agriculture, and was the means of inducing farmers to raise corn rather than buy it, thereby saving thousands of dollars to eastern farmers. Before this fertilizer was introduced, it was thought that corn could be bought cheaper than it could be raised; but farmers soon learned that with the Stockbridge Corn Manure and improved tools they could raise it for from 25 to 50 cents per bushel, and that the stover, if properly cured, was worth almost as much as stock hay—at least $8 per ton—and that the two or three tons stover raised per acre would pay for the fertilizer the corn remaining to pay for the labor and profit. The standard of the Stockbridge Corn Manure having been kept up to that of 1876, more farmers are using it than ever before.

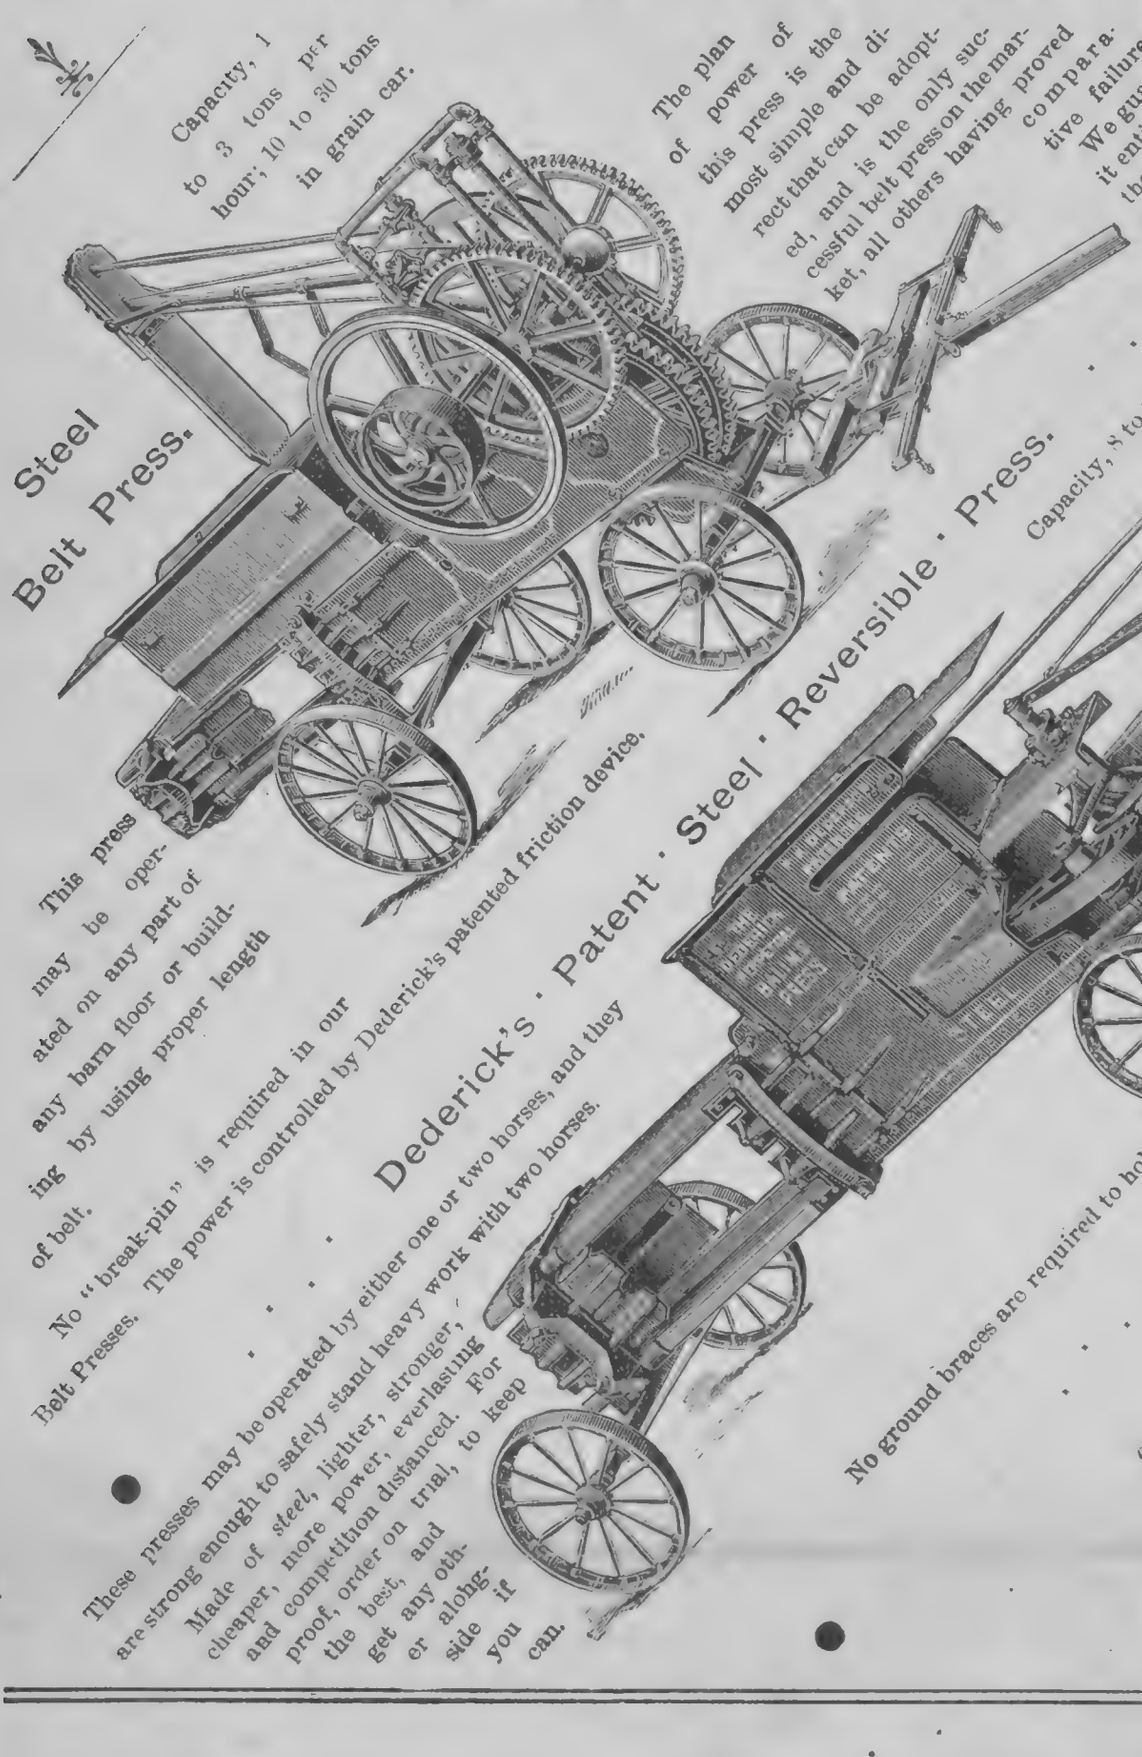
UNRIVALLED.—DEDERICK'S STEEL CASE BALING PRESSES.



Steel Belt Press.

Capacity, 1 to 3 tons per hour; 10 to 30 tons in grain car.

This press may be operated on any part of any barn floor or building by using proper length of belt.

No "break-pin" is required in our Belt Presses. The power is controlled by Dederick's patented friction device.

These presses may be operated by either one or two horses, and they are strong enough to safely stand heavy work with two horses. Made of *steel*, lighter, stronger, cheaper, more power, everlasting and competition distanced. For proof, order on trial, to keep the best, and get any other along-side if you can.

Dederick's · Patent · Steel · Reversible · Press.

The plan of power of this press is the most simple and direct that can be adopted, and is the only successful belt press on the market, all others having proved comparative failures. We guarantee it entirely beyond the range of competition.

No ground braces are required to hold our steel presses, which is proof of ease of operation.

Capacity, 10 to 15 tons per day.

Dederick's · Patent · Steel · Full · Circle · Press.

Capacity, 8 to 12 tons per day: 10 to 15 tons in box car.

These presses have the open-side bale chamber closed at the discharge end sides, spring retainers, screen press box bottoms, open feed orifice, spring top traverser, folding device, etc., and we guarantee them entirely beyond the range of competition.

Two positive strokes of the traverser to each round of the horses. Patent automatic feeder.

Tubular connection. See catalogue for full particulars.

Others may print as good or better illustrations, claim advantages and superiority, but we stand on the merits of our machine, and only ask an opportunity to substantiate all we assert by test in the field. Send for location and address of Western and Southern storehouses and agents. Address

STRENGTHENING OF THE SOIL AND GOOD GRASS CROPS.

THE MAPES MANURES. TRUE MANURES—NOT STIMULANTS.

LASTING EFFECTS ON GRASS, ETC.

(*Timothy* (1837) *Splendid growth.—Wheat* (1886); *Potatoes* (1885).*—Only the Mapes Potato* (1,500 *lbs. per Acre*) *Used in* 1885.*—Nothing Else Since.—Field* 20 *Acres.*

Dr .W. S. COMBS, Freehold, Monmouth Co , N. J., whose experience with the Mapes Manures has been published in the New Jersey State Board of Agriculture Reports and the Agricultural Press, reports as follows, January, 1888 :

The twenty-acre field in potatoes in 1885, wheat 1886, clover 1887, gave a heavy crop of red clover this year, particularly so for the first year's cutting after wheat. The field was manured *all over* in 1885 with 1,500 lbs. of the Mapes Potato Manure. One half of the field received farm-yard manure (with some marl compost) ordinary dressing, say 15 to 20 loads. Yield, as was reported before, was 385 bushels per acre on the ten acres that received the Mapes alone, and 325 bushels per acre on the remaining ten acres manured with the Mapes and the farm manure. The wheat yield was 33 bushels per acre—no difference apparent in the two parts, Timothy was seeded with the grain. Clover was sown in the Spring of 1886. The yield of clover hay this year, 1887, was 2½ tons per acre. The past season was very trying to grass and only in a very few cases for miles around was the grass crop good. As a rule, the grass was very poor.

During the past week a representative of a fertilizer company visited the field, and was so impressed with the growth of Timothy since cutting, that he remarked, "An onion bed would not have done better." This field had been pastured (18 head on 20 acres) for two months after cutting in June. A most interesting fact is that there is no difference of any improvement whatever in the grass on the half of the twenty-acre field where farm manure was applied in addition to the Mapes Potato Manure in 1885. The ten acres that received the Mapes alone in 1885 produced just as good grass this year (1887) and promise equally well for 1888. I propose to try on the portion that received the farm manure, this year, some 300 bushels per acre of marl (green sand Squankum), to see if the increase in yield will pay a profit *over Mapes alone.*

The above experience related on the twenty-acre field, showing the effects of the Mapes Potato Manure, applied in the Spring of 1885, on the wheat in 1886, and clover hay in 1887, is only one of several I have had since I have been using the Mapes Manures.

Top Dressing Grass Field of Seven Acres.

Increased Yield of Hay 7 Tons, from Less than 300 *lbs. per Acre of Top Dressing.*

VALENTINE FROST, P. O., Locust Valley, L. I. (whose reports on the Mapes Manures on Oyster Bay Asparagus for some 12 years have appeared in our pamphlets), reports, January, 1889 :

I top dressed a field of seven acres of grass that had been in grass four or five years. The field was seeded to wheat in 1883 or '84, with 100 car loads of New York manure, costing $40 per acre. The wheat turned out 25 bushels per acre. The succeeding grass was all Timothy.

Last Spring I applied as a top dressing, during the first week in April, one ton of the Mapes Top Dressing Manure on seven acres, leaving one acre without any dressing. The effect of the fertilizer was very marked a few days after its application. The soil was moist, and the conditions for the action of the fertilizer were favorable. I could see where the application was made as far as I could see the lot. The increased yield of grass was the most satisfactory point. The seven acres yielded fully seven tons more hay, or an increase over the acre not dressed of ONE TON per acre.

I have used your manures some 12 years or more, and have always had very satisfactory results. They are more effective than stable manure, and cost much less money.

14 *Tons of Extra Quality TIMOTHY HAY on Six Acres the Fourth Year after Potatoes* (*Followed with Wheat*).

RICHARD L. HUNT, Queens Co., Long Island, N. Y., December 29, 1887, reports :

I took a six-acre field of heavy loam soil for a test of your manures on grass following wheat crop, and the result has been very good.

In the Spring of 1883 I planted a field with Early potatoes with 1,000 lbs. of the Mapes Potato Manure to the acre. The yield was over 200 bushels to the acre of very smooth, large potatoes. In September the field was sown to wheat with Timothy, with 1,000 lbs. of the Complete Manure, "A" Brand broadcast. Yield of wheat, 25 bushels to the acre. In 1885 it yielded 11 tons of mixed hay, clover and Timothy, of the first quality; in 1886, cut 12 tons, and in 1887, it made 14 tons of clean Timothy. This fourth year cutting was the finest piece of Timothy hay I ever saw. I certainly never put a machine in a better field. Many who saw it remarked that it could not be better.

Dr. HENRY STEWART, on The Mapes Manures: The followiug testimonial, in the *New York Weekly Times*, by Dr. Henry Stewart, Agricultural Editor, is on the permanent effects of the Mapes Manures. Dr. Stewart relates that he used three bags of the Mapes Potato Manure per acre, applied in Spring, on three acres of the poorest worn-out land at Westwood, Bergen Co., N. J. (no manure or fertilizer of any kind having been used since), and produced six SUCCESSIVE CROPS (including potatoes, rye, Hungarian grass and sweet corn), concluding as follows: "There have thus been six crops taken from this field and a seventh is growing, and it is absolutely certain not one would have been grown without the fertilizer (applied on the potatoes)."—*New York Times, July* 15, 1882.

Dr. Stewart also writes:

"When a field is so poor that it will not grow clover, then good artificial fertilizers are the only resource. They soon put the farm in a condition to make large quantities of manure." By this, Dr. Stewart means that by the largely increased quantity of feeding crops, corn, roots, grain crops and grass (timothy, clover and Hungarian) that can be grown with the fertilizers, increased quantities of stock can be fed, and a larger manure pile will be the result.

DR. STEWART WRITES FEBRUARY 22, 1889:

"I am more than ever convinced of the value of the Mapes system of COMPLETE fertilizers"

Send for Descriptive Pamphlet.

THE MAPES FORMULA & PERUVIAN GUANO CO., 158 Front St., N. Y.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLVIII NO. 2052 NEW YORK, MAY 25, 1889. PRICE FIVE CENTS, $2.00 PER YEAR.

[Entered according to Act of Congress, in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington.]

Horseman.

THE SCRUB.

TWO weeks ago we gave a picture of the head of a remarkably intelligent and handsome horse. This was to show what skillful breeding and the best of care can accomplish. We want our readers to place that picture by the side of the one shown at Fig. 122. The latter is also taken from life. It represents the head of a poor, broken-down animal that spends its days in hauling about a huckster's wagon. It is a sad sight to see him toiling along over the hard pavements. He is evidently a horse of good breeding. If he could only speak, he could tell a sad story of man's ingratitude. Years ago he carried his head as proudly as the most fastidious driver could desire. He worked well and faithfully. Who knows but that his speed and courage were relied on some dark and stormy night to bring the doctor so that some dear life might be saved? All these acts of service were forgotten when age or accident spoiled his proud bearing or his ready speed. He was sold and drifted through one hard place after another until he came to his present degrading service. Now he goes stumbling through his duty, with the pride, the courage and hope clubbed out of him. It is a shame! It is a disgrace! What shall be the punishment of the man who would turn a faithful old servant into the hands of those who would reduce him to such a condition?

There are two animals on the R. N.-Y. New Jersey farm that, in their appearance and behavior, illustrate something of the difference we have tried to show in these two pictures. One is a little brown Canadian mare. She is a tough, wiry little animal, full of life and energy and with an almost human intelligence. She has always been treated with kindness, and has never lost her self-respect. As a consequence she actually takes an interest in her work, giving the plainest indications of satisfaction and pleasure when her work is satisfactory. Her special delight is in cultivating or furrowing or in other work where a perfectly direct course is needed. The writer has seen her glance back along the row and nod her head in satisfaction when she saw that it was as straight as an arrow. If, in cultivating, she should step on a hill of corn or potatoes, she is evidently sorry for it. The other animal is a poor little gray mare that had been whipped and abused all her life. When we bought her she had just finished a season's work on a thrashing machine, through which monotonous work she had been clubbed without mercy. She has but little interest in her work. She goes along with hanging head and stumbling feet, little caring what the result of her work is. The Canadian mare knows from experience that she will not be abused and worked too hard, while the other one has found that the harder she worked the more she was expected to do. The gray mare seems to improve a little, however. Perhaps it is due to the association with her more fortunate companion.

THE RESULT OF ABUSE. From Life. Fig. 122.

Rural Topics.

BUCEPHALUS BROWN'S NOTIONS AND IDEAS.

ON OVERGROWTH.—Mrs. L. M. C. does well in calling attention, in the RURAL of May 4, to the fact that the practical and sedate Englishman does not care to compete with the Yankee in the production of over-grown fruits and vegetables; but sensibly prefers well-grown specimens of medium size. This fondness for "big things," without regard to quality, is fostered by the stupid "committees" at our fairs, local and State, which almost invariably accord more "points" to size than to quality in all exhibits, from bullocks to mushrooms.

WE WANT JUDGES.—Men who know good products from poor ones, men who take pride in the quality of what they produce, giving only a just and practical value to size, are driven away from the fairs and expositions of the country by these absurd awards. What is demanded on all hands by worthy competitors is competent judges, men of knowledge and character, who thoroughly understand their work and their duty, and do them faithfully, honestly, intelligently.

WELL UNDERSTOOD.—That the people well understand the ordinary basis of awards, is shown by the frequent remark heard: "We had a bigger squash," (or turnip, or pumpkin, or potato,) "than any that is here; I wish we'd 'a brought it." No self-respecting man wants to enter into a contest of this sort. Size, alone, above that which is recognized as normal and of marketable value, should have no recognition, except as a disqualification. It is true, as the Editor says, that "large specimens are always regarded with interest," just as we look with interest upon every sort of abnormal or monstrous thing; but this interest is far removed from the interest of approval in all intelligent minds.

TRANSPORTING CORN.—Mr. Glidden was not quite careful enough in his statement criticised by J. P. A., of Florida, on page 298. "The North" is a very vague term. An Alabama man would call Maryland and Kentucky "North," but climatically, so far as corn is concerned, there is but little difference between the three States. While Alabama corn might be too late for Maryland, probably any good Maryland variety would succeed in Alabama, but when we get farther north, things are very different. Mr. Glidden would have been quite right if he had said that few sorts of corn grown from New Jersey to the St. Lawrence would succeed well if carried 60 miles north, or 100 miles south, in the valleys; or when removed equivalently as to elevation, say from the Hudson valley up to the Catskills, or the Green mountains. Scarcely any cultivated plant is so influenced in its growth by temperature as corn. A 90-day corn from Maryland, or from Connecticut, or even from Massachusetts, taken 100 miles north in New England, would not mature in 125 days without frost—simply because in all those 125 days the aggregate of heat would not equal the aggregate of heat in 90 days in the more southern locality. This is the way in which inexperienced planters get badly deceived by quite truthful advertisements. But the advertisers who offer 90-day corn should say where it was grown. The St. Lawrence valley not infrequently has 120 days free from frost between corn-planting

time and harvest; yet a corn, like Angel of Midnight, which matures in 90 days in Massachusetts, will not get out of the milk in the best seasons in the Province of Quebec. When far northern corn is taken far southward, it tends to become feeble under the hot sun, and produces only a few chaffy nubbins, although it may give from 50 to 100 bushels of sound corn to the acre in its home.

TREE WITHIN TREE.—The case reported by W. P. B. in a late RURAL is not unique. There is a specimen preserved by Dr. H. A. Cutting, late State Geologist of Vermont, of a sapling some three or four inches in diameter, which dropped out of the interior of an immense and apparently primeval forest tree when it was cut down and split open. What was very curious, and caused the preservation of the specimen, was that although the old tree was, by its rings, upwards of 200 years old, the sapling presented plain marks of having been deeply cut by a steel axe. I write from memory, having, however, seen the specimen myself. Dr. Cutting's address is Lunenburgh, Vt.

HOW EXPLAINED.—The fact being assured, a theory of the cause is admissible. I believe that a serious shock to the vitality of a young tree may cause the growths of one, two or more succeeding years to adhere but slightly together, as we see it sometimes in what is called "shaky" timber. Then, the tree acquiring fresh vigor, grows on and may become very large. But when it is cut down and split open, the portion which grew before the injury may "peel out," or "come loose," as described.

Everywhere.

THE CASH CROPS.

Where the Money Comes From.

WHAT OUR READERS RAISE TO MEET CASH EXPENSES.

AGRICULTURAL CHANGES.

HERE is a copy of a letter that the R. N.-Y. has been sending to some of its subscribers. Short replies from a few of the Eastern States follow. We shall publish more later. Meanwhile we shall be glad to hear from any of our readers who are interested in finding the crop that will bring them the most money:

"WE believe in comparing notes as often as we can. It is a good thing for farmers to talk over crop prospects and means of raising money. The experience of one may teach another some good lessons. With this idea in mind, we take the liberty of asking you to send us brief answers to the following questions relating to

THE CASH CROPS.

1. What crops or agricultural products do the people in your neighborhood depend upon to raise money?

2. Where are such products sold and who buys them?

3. How have prices averaged for the past few years, and what seems to be the prospect for the future?

4. Are there any farmers in your neighborhood who are getting prices that are above the average? How do they do it?

5. Has the farming of your section changed much during the past 10 years? Do farmers depend for their cash upon other crops than those of the past? What has caused the change? Can you suggest still other changes that would be profitable?

You will readily see that short answers to the above questions from different parts of the country would contain much valuable suggestion and information."

FROM NEW HAMPSHIRE.

1—3. Growing fruits and vegetables, and keeping cows for milk are the things on which most of the people in this neighborhood depend to obtain money, though some are successful in the poultry business. Milk is sold to milkmen and they pay the farmers about three cents per quart. Some of it goes to Nashua, and some to the creamery at Lowell, Mass. The other products are sold at the markets in Nashua, N. H., and Lowell. No. 1 fruits and vegetables generally command good prices, while inferior products have to be sold at low prices, and this seems to be the prospect for the future.

4. Yes, there are some farmers who are getting prices that are above the average. They do it by carrying to market only first-class products. Customers soon find them out and most of the buyers are willing to pay an extra price.

5. Farming in this section has not changed much during the past 10 years, and most farmers grow about the same crops they used to. A few of them have changed, however, because they found they could make more money and work no harder for it. I know one man who, 10 years ago, did not have a strawberry plant growing; now strawberries are his principal crop. He grows fine berries and gets a good price for the fruit. It would pay many farmers to plant fewer acres and take better care of their crops. One acre well cultivated will pay better than two acres half cultivated. F. E. S.

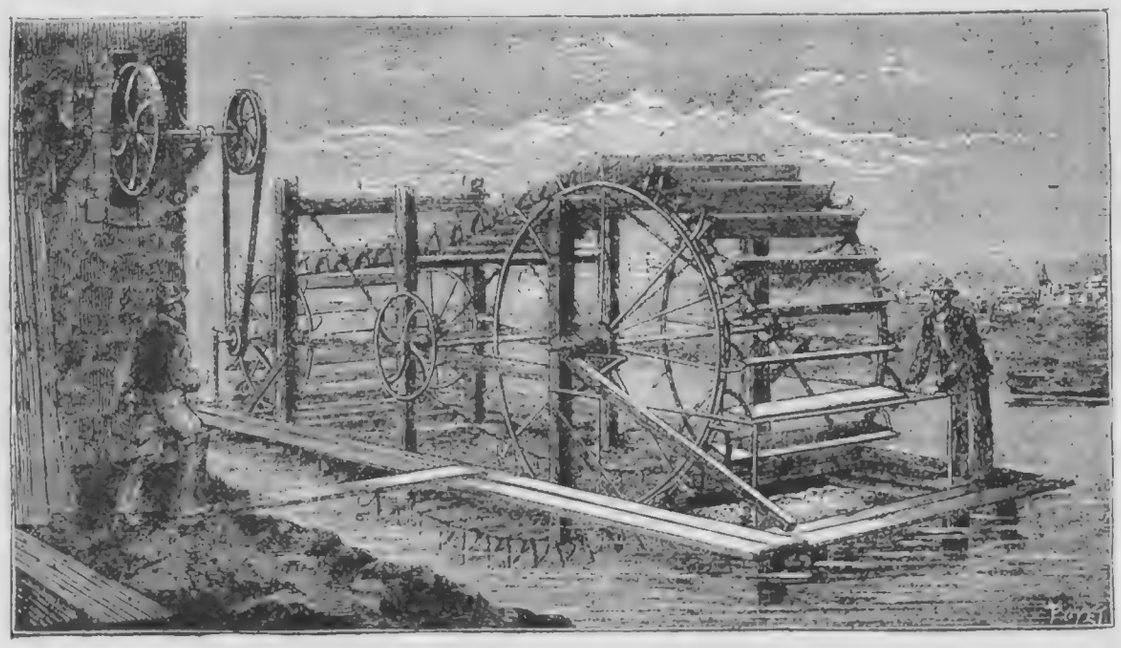
Hudson Center.

FROM VERMONT.

1. Corn, wheat, oats and barley are not raised here as cash crops. Indeed, potatoes are about the only cultivated field crop raised with the view of turning the same into ready money. Many thousands of bushels of onions were formerly raised yearly in this town; but this industry is now mainly confined to the French population, who alone, with the aid of their children, can raise the crop with much profit. Our potatoes are mostly sold, when dug, to middlemen; but some are stored till late fall or winter. Prices are unusually low just now—only 25 cents per bushel. Our fields are too small, and the ground is too uneven and stony for the use of expensive machinery in competition with the West. Still, one year with another, we consider this a paying crop. I think the product increases yearly and we are disposed to stick to it, and depend, if necessary, upon our "smartness" for success. The unwise practice of selling large amounts of hay is on the increase. Over 5,000 tons were shipped from two railroad stations near-by during last fall and winter. Fattening beef is a thing of the past with us. The dairy pays fairly well and affords ready cash. The Spanish merino sheep! This is the banner county of the world for that golden-hoofed animal.

Give us once again our former prosperity, and we will be more contented and happy than the sons of Abraham in Jerusalem!

Cornwall. L. W. P.



RAFT WATER POWER, Fig. 124.

FROM MASSACHUSETTS.

1. Dairying, poultry raising, and fruit culture are the principal money-making farm industries here.

2. Most of our products are sold in Fitchburg and Boston. Those sent to Boston are sold on commission.

3. Prices of most products have averaged very well, although some fruits have sold low on account of over-production and poor quality. The prospects are good I think for those who raise first-class products.

4. If they do, it is because they raise a superior article and put it up honestly and attractively.

5. The farmers in this place are, most of them, wide-awake and they try to keep up with the times, and if farming has changed for the past 10 years it has changed for the better I think. A. W. B.

Ashby.

FROM NEW JERSEY.

1. Milk. 2. It is partly shipped to Philadelphia and partly sold at Trenton. 3. Average wholesale price 3½ cents per quart. There is no prospect of better prices. 4. A few by selling choice Alderney milk get better prices. 5. There are more "truckers" now than formerly, but, as a rule, farmers still depend on old-time crops. Some branches of farming, however, have been dropped almost entirely, partly owing to low prices for grain of late, and partly on account of the disastrous competition with Western dressed beef, which has made the price of fat stock so low that farmers cannot afford to fatten either beeves or sheep. This means more expenses on the farm for fertilizers. I am glad that a bill has been introduced in the legislature of New York for the inspection of live stock before they are slaughtered. I would like to see the farmers of New Jersey wake up to the evils of the dressed meat traffic so that the average farmer could have a home market for his hay, straw and grain and also be able to make abundant manure on the farm. J. Y. D.

Robbinsville.

1. Principally hay, milk, garden vegetables and eggs. 2. They are sold in near-by towns—Elizabeth, Newark, Plainfield, Rahway, etc. Wholesale dealers or middlemen buy the most of them. Hay is sold to customers. Prices are much lower than they were 20 years ago, while expenses are about the same. There is no no visible prospect of improvement. 4. Some living near towns retail the milk and vegetables. 5. Agricultural pursuits have changed very much within the last 25 years. The old settler, industrious, practical, sensible, economical and experienced, has gone. Speculators, foreigners and amateurs are trying to make farming pay, and failing, land is depreciating. A return to some of the good old ways of our fathers, with under-draining, manuring, clean cultivation and better market facilities would be an improvement. D. C.

Roselle.

1. Summer vegetables, fruit, berries, hay and corn.

2. To the residents of Asbury Park and Ocean Grove.

3. The prices were very good until last year. As the boarding season then was so short prices didn't pay.

4. A few have regular customers the year round, but the sales are so small it does not pay to hunt them up.

5. There have been many recent changes: 40 years ago farmers depended mainly on their potatoes, peaches and strawberries for money. Peaches are now a failure through this section. The changes have been caused by the many summer resorts started along the shore, which have given us a home market. It does not pay to send our products to the city, as freight, commission and cartage take nearly all. I think it would be profitable to go into the dairy business more extensively. E. W.

Farmingdale.

Our crop rotation is about as follows:—Corn upon sod ground, and the manure of the farm is put upon it. By many the corn is largely turned into pork; by others into milk for Trenton, Philadelphia, the sea-side resorts and the creameries. The pork-growers follow corn with rye, which is fed to hogs; others sow oats. These crops are followed by wheat; not that there is any profit in it, but it is the best crop for getting the land to grass, and we need the straw for bedding. We use commercial fertilizers on wheat. Then the land lies two years under grass—one to mow and one to pasture. The pork crop is cash. Much is used by local sausage makers, and at Trenton, (population 60,000.) Some fatten 20,000 to 25,000 pounds by buying some feed. The milk sold to Trenton retailers pays best—three cents in summer and four in winter. That sold to Philadelphia comes next; that sold to the creamery brings about two to three cents. Not many calves are raised, as the same feed needed for a calf will raise a colt to three years, and he will bring three times the money; it will keep another cow. Many farmers raise from one to three good stock colts per year, bringing from $150 to $250. Quite a good many peaches and small

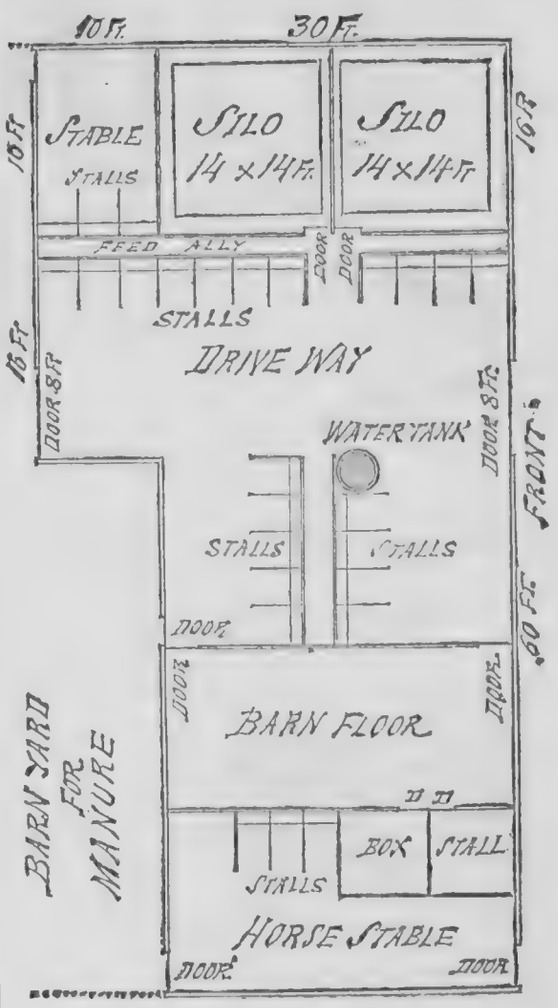


Fig. 123

fruits are raised, and considerable truck is grown, and, so far as we can, we try to grow such things as are not supplied by the great Northwest. S F. W.

Allentown.

FROM PENNSYLVANIA.

1. Cabbage and potatoes.

2. In the coal regions of Lackawanna valley, mostly in the city of Scranton. About half our products are sold to consumers; the other half to merchants and marketmen.

3. Prices for the past few years had been in favor of the producers, until last fall when there was a general decline, with a prospect of continued low prices.

4. Yes, by raising a greater variety of vegetables and fruits, of better quality, and selling direct to the consumer.

5. Yes, a few years ago the farmers of this section depended upon their hay and potato crops for their money. Raising these caused poorer crops each year, until the want of manure led to keeping more stock and feeding what little hay was raised. On account of the low prices of potatoes and the trouble of raising good crops, they are not grown as much as formerly. Cabbages have proved more profitable. Most farmers are selling their milk, and dairying promises to be the leading business for the future. We have a good market for small fruits, but little is grown here, and I predict a growing interest in this business in the next few years, while less attention will be given to raising potatoes and cabbages. G. W. G.

Justus.

1. The barley crop has been the main one for money. The rotation of crops along the lake is confined to clover, corn, barley, winter wheat, and then we seed down again. The corn is principally used upon the farms in fattening a few cattle or sheep. Lately hundreds of acres of grapes have been set out. What the outcome will be no one can tell yet.

2. There are local buyers who buy and ship to Pittsburg, Cleveland, Erie, Buffalo and other points.

3. Prices for the last few years have averaged as follows: barley, from 60 to 80 cents; steers, 3½ to five cents per pound on foot; wheat, about $1 per bushel; corn, about 40 to 50 cents.

4. One farmer who has a herd of Jerseys, and makes fancy butter, has customers in the city and gets 30 to 40 cents per pound, when common dairy is from 16 to 25 cents.

5. There has been very little change, with the exception of the grape business, and raising products for a canning factory that was started here a few years ago.

The outlook for farmers is the poorest we have had since the war. There appears to be an over-production of everything. A good many potatoes were raised here last year, and they have sold on the Erie street market as low as 10 cents per bushel, and one man could not sell his load and offered to give them away. Another raised a lot of onions; he has them now and cannot give them away. The canning factory has shut down and will not run,

claiming that there are enough canned goods to last two years if another can were not put up in the United States. The Prohibition people have got a bill through the Legislature to submit to the people, on June 18th, a consti-

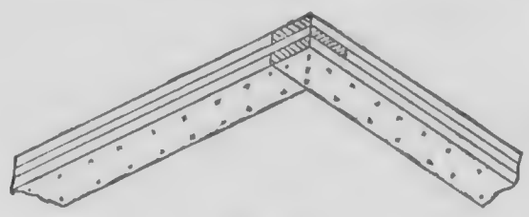

Fig. 125.

tutional amendment prohibiting the manufacture and sale of all liquors in the State. If it passes it will not pay to raise barley any more, and as cider is included, our market for apples will be spoilt. Wheat is worth only 95 cents; corn 37; potatoes $0.00; onions $0.00. One farmer who rents a small farm for $200 cash, raised potatoes intending to pay his rent with the price. He has now 500 bushels on hand and cannot give them away. This outlook, while protected manufacturers, corporations, trusts and monopolies are growing right off the farmer, will eventually ruin this country. J. H. P.

North East.

Here we practice mixed farming. We get most of our money from milk, butter, fruit and stock. A good many of our farmers raise some wheat, rye, corn, and potatoes. Corn and potatoes are the most profitable. All our products are sold near home. We have good markets, especially with the coal regions. Grain is sold to the mills here at little higher prices than those ruling in New York. The prices for butter and dairy products have been better for the past few years and the prospects are good as long as we keep insisting on the passage of prohibitory laws. On most farms raising grain does not pay even for the labor. A few of us are getting extra prices for our butter. I have been getting from 35 to 40 cents per pound for my butter all winter. The reason is that I keep good thoroughbred Holstein-Friesian cows, feed them well, make my butter right and know when and where and how to sell it.

Our creameries are getting extra prices for their butter. They make a good article and sell direct to the merchants in the coal regions. A few of us are also getting extra prices for our fancy fruit, because we pick it carefully at the right season, sort it well, and sell it to the best customers. For the past three or four years our farmers have been organizing and educating themselves, and hence farming has commenced to change. They are depending more on dairy products and fruit-growing and less on grain production. I would suggest that our farmers should go extensively into fruit growing, as our soil and climate are well adapted for the business, and we have the best home markets in the country. We have a few small peach orchards that have paid well, and are looking fine. The fruit sold last year for $1 50 per basket, and I know some Fallawater and Baldwin apple trees that have borne 20 bushels of good fruit for 10 successive years, and we generally get $1 per bushel for our best fruit in the winter. People should plant the kinds which they know will do well in their vicinity. Let them prune the trees properly and cultivate the orchard well as long as the trees are young. Pruning and cultivating are much neglected here. The following is a good list for profit: apples—Baldwin, Fallawater Smith's Cider and Smokehouse; pears—Bartlett, Clapp's Favorite, Anjou and Sheldon; peaches—Mountain Rose, Crawford's Early, Old Mixon free, Crawford's Late and Smock; quince: the Orange. Small fruits, the good and well tested sorts only.

Walnutport. W. M. B.

FROM NEW YORK STATE.

1. Potatoes, butter and eggs.

2. To New York City commission dealers.

3. Fair prices, potatoes averaging 50 cents per bushel.

4. Yes. For eggs, by warranting them fresh White Leghorn.

5. Yes. Yes. Low prices of wheat and pork, and advanced prices of butter, milk and cream. Butter brings from 30 to 40 cents per pound in summer after the city people come out into the country, Southampton being a summer resort. F. D.

Southampton.

1. What we call mixed agriculture is practiced here, embracing the culture of wheat, corn, oats, rye, buckwheat and fruits.

2. Our products are sold to middlemen at our stations here.

3. Prices are low and prospects dull.

4. Some get extra prices, by thorough culture of their crops so as to have fine goods and watching the market closely.

5. Considerable changes have been made owing to low prices. Tobacco and small fruits have been introduced more extensively. I would suggest that farmers should raise some beans and more root crops. Some raise barley and some horses. H. C. Wolcott.

1. Dairying and raising potatoes. Some sell their milk and some sell cream; but most money is made by making butter and selling it at home.

2. Potatoes are shipped, being bought by buyers at this place. Butter is sold at home whenever a buyer is found; if not sold here, it is sent to New York City.

3 Potatoes are a drug, bringing only 25 cents upward per bushel; butter from 20 to 25 cents a pound.

4. They are not.

5. Yes. No change has been made of late. Whitney's Point. J. H. K.

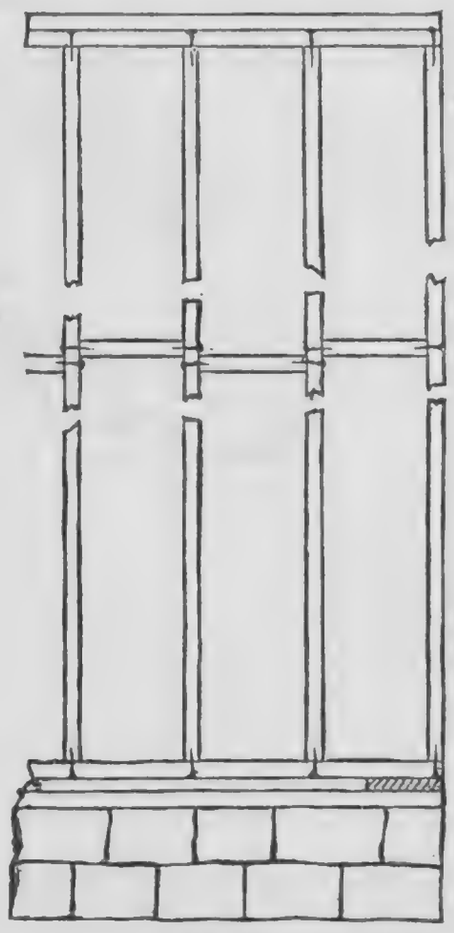

Fig. 126.

1. Wheat, barley, oats, hay, apples and potatoes.

2. We sell to home markets—to millers and shippers.

3 Fair prices have been realized. The prospects for the immediate future are probably no better than the present outlook.

4 I don't know of any who get extra prices. If any do, it is through their shrewdness in marketing rather than through the better qualities of their products.

5. Not much change has been made excepting that more hay is raised and sold.

Tyre. J. P.

1. Our principal cash business is the production of milk for cheese factories. One of the largest and first factories in Western New York was located here. At one time it made 500,000 pounds of cheese in one season. This was several years ago; now the same factory makes only a trifle more than 150,000 pounds, as smaller factories take most of the milk.

2 The cheese is sold at the factory to local buyers, and delivered to the railroad station by the patrons of the factory about once a week. It is mostly sent to Baltimore, Maryland.

3. Prices of cheese here have ranged from one-eighth to one cent per pound less than those quoted for fancy cheese in New York.

4. This being a maple sugar country, a very few are making much better sirup and sugar than the average, and are getting better prices. The use of modern sugar tools usually makes all the difference in results.

5. There has been no material change within 10 years. A very few make a specialty of some one thing, and in that respect there are a few changes. O. F. B.

Rushford.

Before answering these questions I will explain the character of the people in this neighborhood. They are a very conservative class; the greater part of them are old residents occupying the farms they were born and bred upon, and in the language of the "parrot" most of them say "farmin' don't pay," and I don't believe it does except in very few cases if any. Some in fact are dropping behind and several have lost their farms—good clever men too. Now for the questions:

1. The crops mainly depended upon for money, are wheat and barley.

2. They are sold largely right here at Stanley and Hall's Corners, both being good shipping points only three miles apart. The men who buy them are farmers themselves, good reliable men, who buy on commission. Then Geneva, which is about eight miles away, has two large malt houses, one for barley and one for wheat. When they pay more than the shippers, they get the grain.

3. Prices have ranged for the past five years, for wheat from 75 cents to $1; for barley, from 50 cents to 80 cents. There seems at present no reason to expect prices to be any better in future (unless more liquor is drank).

4. I don't think any of my neighbors get more than average prices, but some get less. Those who raise the largest crops per acre generally have the best quality, and of course get the best prices.

5. I do not think farming hereabouts has changed greatly in the past 10 years. Of course more machinery is used upon the farms and more commercial fertilizers are applied, while less summer fallowing is done and in many cases more weeds are permitted to grow. The all-important questions seem to be "What to do? and How to do it in order to make more money?" The raising of beef cattle has become unprofitable owing to the large supply of Western dressed beef. As the most important result of all this, one year ago a company was formed and a creamery was established here at Stanley. A very fair business was done last season, with quite satisfactory results for those who patronized the business. The out-look for this year seems encouraging. The cream is gathered from the farms and taken to the creamery.

6. If I were to offer any suggestions by the adoption of which sure profit would be made, I would advise better farming—more thorough preparation of the soil for the crop, more economy in saving and applying the manure made on the farms, more regard for good clean seed and better cultivation and care after planting. In short, if the farmers in this neighborhood would all take the RURAL and read it and then have sense enough to put in practice what it teaches, I think improvement would be the result. F. E. V.

Stanley.

1. Potatoes have been the principal money crop the past season. The yield was from 100 to 150 bushels per acre; the price from 20 to 40 cents per bushel—average price 25 cents.

2. Large local buyers and shippers of agricultural and dairy products have purchased large quantities of potatoes the past winter for which they found a ready market in Baltimore, Maryland, and Pittsburgh, Pennsylvania, and other cities and places. Farmers, as a rule, draw their produce to Buffalo, their nearest market.

3. Prices are now lower than they have

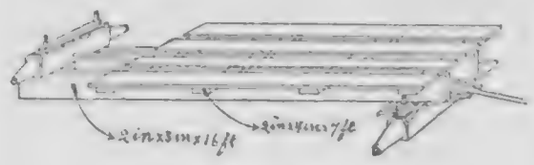

Fig. 128.

been for several years past. Potatoes for the past few years have brought 40 or 50 cents per bushel. It is likely that in future farmers will direct their attention to other agricultural pursuits.

4. The milk from the farm of H. C. Jewett & Co. of this place, who keep a fine herd of grade Holstein cows, is sold in Buffalo for one or two cents per quart higher than the average milk. The increased price is due to the feeding and care given to the cows, and also to the care taken of the milk after being drawn from the cow, by properly cooling, bottling and preparing it for market.

5. There have been some changes as farmers are feeding more silage and using larger quantities of commercial fertilizers, and many more labor-saving machines than they did 10 years ago.

6. They do, namely, fruit, grain, hay, butter, cheese and milk. Dairy products brought a fair price during the past season. The fruit crop was short with the exception of grapes. The hay crop was also short, and farmers have depended largely upon Western hay to feed their stock.

7. Deeper plowing. A more liberal application of fertilizers and clean, thorough culture of the crops in hand. G. W. N.

East Aurora.

Farm Economy.

SILO BUILDING AND FILLING.

IN Bulletin No. 19 of the Wisconsin Experiment Station, L. H. Adams has an excellent paper on the above subject. As readers of the R. N.-Y. know, this Station has led in ensilage investigation. Mr. Adams, having fully studied the subject, speaks with authority. Perhaps the most important portion of the essay is that devoted to

BUILDING THE SILO.

An 18-inch stone wall should be laid deep enough in the ground to be beyond the action of frost, and raised high enough above the surface to admit of sufficient grading to divert all surface water; if the location be a high and well-drained one, there will be no necessity for raising the wall more than six inches above the surface. In digging the trenches, throw enough earth inside to raise the silo floor up to the top of the stone wall. Upon this stone foundation a sill made of three 2x10 planks should be bedded in mortar—see Fig. 125. In laying the sill, the top plank should not be fastened to the others, but left loose, for reasons soon to appear. The studding should be 2x10 plank, preferably 18 feet long. After carefully sawing the studs to a uniform length and squaring both ends, arrange them in a horizontal position, resting on the edges, and placed 16 inches apart; they should be supported on a level with and at right angles to the sill upon which the bent is to be raised. Then spike the loose plank of the sill to the foot of the stud; and when all have been firmly fastened as directed, they should be secured at the top in the same manner. After fastening the studding to sill and plate-planks, the side or end, as the case may be, is ready for raising. After the bent has been raised in a vertical position to its place on top of the other two planks of the sill, the third one that was nailed to the foot of the studding before the bent was raised can be firmly spiked to the lower ones. This first bent can be held in place by temporary stays until the remaining bents are raised; the plates can then be nailed at the corners, and the skeleton frame is complete; two 2x10 inch planks will give all the strength necessary for the plate. It will be observed that by following this plan the studs are securely fastened, top and bottom, and the full strength of sill and studding is saved, there being no mortises cut in the sills and no tenons on the studding. After the frame is up, the next thing to be done is to bridge the studding (see Fig. 126). In case the silo is 18 feet deep, it would be advisable to put in two rows of bridging. By thus spiking planks between the studs, it makes it just as impossible for the studs in the center of the wall to spring out as it is for those nearest the corners. We are now ready to commence lining the silo. Each one can follow his choice as to the outside covering, since it plays an unimportant part in the preservation of the silage. Some will prefer to use drop-siding or ship-lap, others common lumber, and it is possible to put on a covering of low-grade shingles cheaper than any other way. It is not necessary, for the preservation of the silage, that paper be used on the outside of studding, but to keep out frost it is advisable to use it, since it makes the silo much warmer. Since a good deal of moisture rises from the silage, it is well to provide for ventilation at the roof. This can be done by openings in the gable ends of the building, or a dormer-window in the roof. It is much better to carry off the moist air by ventilation than to have it congeal on the rafters during cold weather, and drop back again when mild days come. The lumber for this should have no knot-holes,

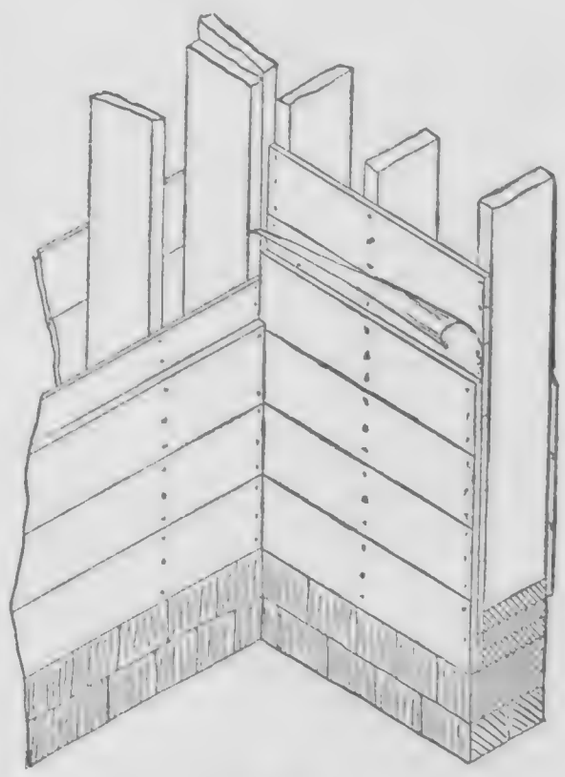

Fig. 127.

and should be dressed on one side, and is better if edged so that the joints will be reasonably tight. The lumber need not be of uniform width, but boards from eight to 10 inches wide are preferable. The inside of the studding is first covered with boards, laid horizontally (see Fig. 127), ten-penny nails being used; building paper is then tacked over the whole surface. Upon the paper, nail a second layer

of boards. Care should be taken to break joints, which can be indicated by chalk marks on the paper. This double lining, with paper between, must reach from the top of the silo to the bottom of the sill.

The floor of the silo need be nothing but the earth; as already mentioned, it is a good plan to fill in the silo until the floor is on a level with the top of the stone wall; a layer of straw spread on the bottom before commencing to fill with corn will prevent the loss of any silage.

The silo should be tied across the top at two or three places with joists, or a cheap cable; this latter may be made by twisting three strands of galvanized wire which costs about three cents per pound; five pounds will make a cable sufficiently long to reach across an ordinary silo. If the silo is more than 30 feet long the sills should be secured at two or three places with a cable of this kind, which, as it rests on the ground, is entirely out of the way. The modern silo will not tolerate partitions of any kind; they are relics of the past. There are several methods employed for cutting off the four corners of the silo. Perhaps the simplest plan is to bevel the two edges of a foot-wide plank and nail it securely in a vertical position in the corner. A dormer-window in the roof of the silo affords satisfactory means of getting the corn into the silo in the fall.

HOW TO PAINT INSIDE WALLS.

An examination of one of the Station's silos that had been treated with a coat of coal-tar shows that one season's exposure to the silage had not affected the wood in any manner. This coal-tar possesses another great advantage over ordinary oil paints, there being so much body to it that it readily fills up all cracks in the lining, and aids greatly to make the silo air-tight. It is one of the waste products in the manufacture of gas, and can ordinarily be obtained in any quantity at gas works at three or four dollars a barrel. As it comes from the gas works, it is a liquid of about the same consistency as molasses, and it is necessary to burn off considerable of the oil that it contains before it is in a condition to apply to a wall. This burning is a simple process: pour a quantity of the liquid into an iron kettle, set fire to a handful of straw and throw it in the kettle. The tar at once flashes up and burns with great heat. In order to tell when it has become sufficiently reduced, thrust a stick into the blazing kettle, then take it out and plunge it into a pail of cold water; when the tar clinging to the stick has become sufficiently cool to handle, take a particle in the hand and pull it out; if it will string out in fine threads a foot or more long, it has burned long enough, and the fire can be put out by placing any tight covering over the kettle. It usually takes from one-half to three-quarters of an hour to reduce the tar to the proper consistency. This preparation must be applied hot, and it will be necessary to swing the kettle up from the ground and keep a fire under it until the work is done. The odor and smoke from the hot tar are very disagreeable, but by taking small quantities of the liquid and applying it very hot with mops or whitewash brushes, the surface can be gone over rapidly.

HANDLING FODDER CORN.

The cost of putting corn into the silo depends largely upon the advantage we take of all the little devices that are calculated to lighten and reduce the labor of harvesting and drawing to the silo. By the use of the old self-rake reaper for cutting in the field, and conveniently equipped wagons for hauling, corn can be cut into the silo for from 50 to 75 cents per ton, and there will be no more hard work connected with it than there would be in harvesting a clover or grass crop. Many farms are supplied with low-wheeled wagons or trucks, but when silo-filling time comes there is usually a greater demand for vehicles of this kind than the ordinary farm can supply. A very simple and practical way of equipping the ordinary high-wheeled farm wagon is shown in Fig. 131. This rack was observed in use on the farm of Hon. Hiram Smith, in the fall of 1888. It is made of 2x8 inch plank, 16 feet long, one end of each being placed on top of the forward bolster, the other ends pass under the rear axle and are chained or bolted up tightly to it; these two pieces make the foundation of the rack. The wagon is coupled out as far as these planks will allow. On top of the plank are placed four cross-pieces, equally distant from each other, as shown in the figure. On these cross-pieces are laid inch boards parallel with the wagon. The load is, of course, placed wholly in front of the rear wheels, but the rack is sufficiently large, and low enough to enable a man to put on a ton of green corn from the ground without having to climb up on the load, or hand it to a second person to deposit.

RAFT WATER POWER.

Some two years ago the R. N.-Y. gave an account of a machine, for raising water that is somewhat used in Europe. This account was called out by a request for information sent by one of our readers in Missouri. This reader owned a farm situated on a bluff below which ran a swift-flowing stream. He desired to utilize the force of the stream for pumping water to the top of the bluff where it was to be used for irrigation. We give, at Fig. 124, the very old picture of a machine used for this purpose in Servia; our picture is re-engraved from La Nature. The working of the machine will be readily understood. It is a large, open raft which is securely anchored in the stream. The paddles are made of strong planks and are arranged so that they run around the wheels like the planks on a horse-tread-power. The force of the current makes the paddles revolve and the force thus generated may be communicated to a pump on the bank, which will lift water from the stream.

PRIZE SILAGE.

At the Ensilage Convention held at Cleveland, Ohio, March 6 and 7, prizes were offered for the best specimens of silage. We have received letters from the three gentlemen who won these prizes. These letters are given below. The R. N.-Y. feels confident that its readers will be interested in knowing how this prize silage was prepared. We may further state that Mr. W. H. Strong, who won the second prize on silage, also won the first prize on butter, while Mr. Finzel, who won the first prize on silage, won the second prize on butter. Both specimens of butter were made from the milk of cows that were fed on silage. The R. N.-Y. has received samples of the silage from Mr. Strong and Mr. Finzel. Both were of excellent quality.

FROM JOHN FINZEL, WINNER OF THE FIRST PRIZE.

I built my silo and part of my barn last year. The silo is built of wood lined inside with two thicknesses of lumber with tarred paper between. My studdings are 2x8, 18 feet long; but the building did not stand the pressure as it spread somewhat, consequently some of the silage became spoiled around the outside; but, after all, it was the cheapest feed I ever fed. I shall strengthen my silo this year with timber on the outside. The corn that I took to the convention was Leaming and was almost matured. It had been planted in drills from two to three stalks to the foot, 3½ feet apart, cut about the middle of September with a Tornado cutter in ⅞-inch lengths. Every load or every alternate load was leveled and tramped down. My silo is in two parts, 14x14 feet each, 18 feet deep. I put in 150 tons, covered it with tarred paper and about 18 inches of straw. I opened the first part on October 15, and fed 45 to 50 bushels a day to 20 head of cows and eight head of yearlings and two-year olds—all they would eat, besides feeding some to horses and colts and the cows ate little else, except chop and bran (night and morning) mixed, and some poor hay at noon. The silage lasted to January 12, and then I fed dry feed one week, but the cows shrank about one-fourth in their milk yield.

I opened the second half of the silo on January 19. More of the silage in this was spoiled around the sides and on top.

I am going to strip, lath and plaster my silo this season with cement. A plan of my barn is shown at Fig. 123.

Lucas County.

FROM W. H. STRONG, WINNER OF THE SECOND PRIZE.

I use Leaming corn for my silage. It was cut when it had commenced to glaze. I use a Ross Cutter—No. 13 A.—driven by a three-horse, crude-coal-oil Shipman engine. I averaged 18 loads per day, which was cut in half-inch lengths. I have three pits: two are 14x16 feet and 20 feet deep; the other is 10x16 feet and 16 feet deep. I fill about four feet, mix well while cutting, and tramp hard around the edges and corners. I let it stand until it warms up to 130 degrees, and follow this mode of filling until all the corn is in. Then cover it about four inches deep with green millet and tar paper, then with sawdust 10 inches deep. I opened the last pit at the end of February without much loss.

My silos are of wood, plastered, with a dead-air space. This is the second time of filling. It took two weeks to fill the pits, and as the corn ripened it kept sweeter. We cut the corn and hauled it directly from the field.

Lucas County.

FROM O. T. BATTLES, WINNER OF THE THIRD PRIZE.

Corn is the best crop for ensilage, producing more to the acre, both in weight and feeding value, than any other forage plant, and maturing when the busy season is over with other farm work. Corn comes nearer to making a complete ration for cattle than any of the other crops used for silage. To make the best silage it should be matured enough for cutting and shocking, which will be when it is well glazed. My silage last year was made mostly from the Southern white corn, planted the middle of May and cut the last of September. It did not ear much, having been planted too thick; eight quarts of seed per acre are quite enough. If much more is used there will not be much grain. I intend to plant the common yellow corn on one-half my ground the present year. If planted the last half of May it will be ready for cutting by the middle of September, and can be got out of the way before the time for commencing to cut the ensilage corn. It will not produce so much in bulk or weight to the acre as the Southern corn; but it will yield much more grain in this latitude. We aim to have our corn ground fitted in the best possible manner, thoroughly pulverizing the soil. I use a hand planter for putting in the seed, harrowing with a Thomas smoothing harrow about the time the blades break through the ground and until they are six inches high. The Southern corn will make a fair crop in a dry season if it be well tended. Two years ago I planted it in the same field and on the same day as the common yellow corn; it grew twice as high as the latter, but did not produce one-fourth of the grain. We cut the big corn with sickles, throwing it on the ground in bundles of a convenient size to handle. Some of it was drawn directly to the cutter and a part lay on the ground several days. A truck wagon with a hay rack makes a good rig for drawing corn to the cutter. The latter should be set on a platform so that the table will be of the same hight as a hay-rack, and one should drive so that the stalks can be unloaded directly upon the machine table. I used a No. 14 A Ross cutter with a 22-foot carrier, and for power a sweep that can be run with two or four horses. The whole rig with some improvements in the power, cost about $175. It could probably be bought for less at the present time.

My silo is built of wood with a concrete bottom; dimensions, 18x34 feet outside, with a partition through the middle, making, when finished, two pits 16 feet square (or nearly so), and 16 feet deep. I use 8x8 stuff for the sills, posts and beams; 6x8 for the plates, with studding 2x8 16 inches apart. It is double-boarded inside with building or tar paper between. For the inside I used cull pine lumber. The first boarding was put on horizontally and the inside perpendicularly, with two coats of gas tar put on hot to preserve the lumber from decay. The outside was covered with drop siding well painted. The whole building cost $350.

The corn was kept as nearly level as possible. After cutting in eight or 10 loads it was well trampled along the edges and in the corners, but not much attention was paid to the middle. Some of the corn was put in wet; but it did not seem to make any difference in the quality of the silage. When feeding I noticed a moldy streak through the pit, caused by the silage being left exposed to the air for four or five days during a rainy spell in the fore part of October. It was not spoiled but was not premium silage. A pit should not be left exposed more than three days when filling without adding fresh feed on the top, as there is a tendency to form a moldy crust on top, just as is sometimes seen in canned fruit. We cut about 100 loads of corn that would average about 2,500 pounds to the load, being about three weeks filling the silo. For covering I used a small two-horse load of straw to each pit, after running it through a cutter, and put some loose boards on top of the straw. I opened the last pit about January 20, and fed the last of the contents on May 5, feeding 40 milch cows once per day from the first of November until the first of April, and after that 20 from feed raised on 10 acres.

Cuyahoga County.

Field Crops.

COST OF HARVESTING TIMOTHY HAY IN 1888.

J. N. MUNCY.

The following data will be sufficiently accurate so that readers may form some definite notion of the expense in putting up hay: The field was accurately measured and contained 14 acres and four square rods. The hay was stacked on the ground in the center of the field. Only small loads were put on the wagons. The hay had been cut with a seven-foot broad-cut mower. All but about three loads was loaded with a hay-loader. An eight-foot hay-rake was used in connection with the loader, in consequence of the light yield per acre. The hay was not raked in light windrows as is so often practiced where hay-loaders are used. My loader will do about as good work whether the hay is in a swath, or light or heavy windrows. The raking was managed in this way: Rake on, say, swath No. 1 until a small amount has accumulated, then cross the adjoining swath at right angles and dump this as near the center as possible; then go back on No. 3 and dump on No. 4 and return. The raker will soon find the most economical way is to turn the rake horse. Hay yielding only 1,000 to 1,500 pounds per acre requires too long a time to take it out of the swath.

Six men and two teams helped in the work of stacking. Chores interfered with a full day's work, and hence I give the number of hours. Two men quit at four and the others at six P. M. The afternoon was very warm and so much was not accomplished as might have been under other conditions. The next forenoon from eight A. M. to 12 M. two men and one team were employed in gathering the scatterings, hauling in about two loads and putting on the "hangers." The teams were quite well-trained, and hence I used no driver on the wagon. The hay was taken from the stack in November, 1888, and weighed 21,400 pounds or 10 and seven-tenths tons. With these data the reader can assess any value for his own time and decide as to the cost of "putting up" a ton. Suppose we figure a team and man at the the usual price of 25 cents per hour.

The cost of stacking is as follows:—

34 hours of man	12½	$4 25
14 hours of team	12½	1.75
	Total	6.00

According to this, the cost of putting one ton of Timothy hay in stack, when it is pitched off "by hand," and loaded on the wagons with a hay-loader is a trifle more than 55 cents. If, now, you allow 40 cents per acre for mowing, the cost of harvesting these 14 acres was at the rate of $1.08 per ton. Assume, however, that the hay had been a good crop and yielded, say, three times as much as the field here given, the cost of harvesting would be greatly diminished. It would be about as follows·

Cost of mowing 14 acres at 40 cents	$5.60
" of stacking.....	15.24
Total	$20.84
Cost per ton	65 cents

In this latter assumption I have deducted the use of a man and rake and horse, assuming that to be 92 cents in the first case. There then remain $5.08, which, multiplied by three give the assumed cost of $15.24. If hay yields 4,500 pounds per acre it is a great loss in time to rake it in windrows, providing one has a good hay loader. If taken out of the swath it can be handled on the wagon much more easily.

A "25-cents-a-day boy" and myself put on five loads, weighing 6,720 pounds or 3.36 tons in 2½ hours. The hay yielded at the rate of 1.62 ton per acre and was taken out of the swath. Allowing $1.25 per day for the use of the hay loader and 25 cents per hour for man and team, the cost of loading is less than 30 cents per ton under these conditions.

Educational.

WHAT ARE THE AGRICULTURAL COLLEGES GOOD FOR?

PROF. D. G. PORTER.

Agriculture absolutely independent of agricultural colleges; apprenticeship and special training, indispensable in other vocations, unnecessary in farming; scientists and specialists confer benefits on agriculture but might make unsuccessful farmers; agricultural papers and reports of agricultural experiment stations tell farmers all they need to know about theoretical and scientific matters appertaining to agriculture; strong tendency of agricultural colleges to divert from farming promising young men who would otherwise be farmers; the chief value of an agricultural college course is to enlarge the mind and increase knowledge and culture; such colleges not designed for general culture; and not necessary for the advancement of practical agriculture; suggested changes of a radical nature; make them "schools of general culture for the winter months, and "farm schools" and practical experiment stations in summer; advantages of such a course; special courses for specialists.

The question of the true value and use of our agricultural colleges is one which is likely to be much discussed in the near future. It is not a question whether or not they are good. It may be conceded at once that they

are good in their way, and do well what they undertake to do. The present inquiry is, What are they good for? What relation do they sustain to the practical agriculture of the country? And what relation do they sustain to the general educational interests of the country?

In the first place, we all understand that agricultural colleges are not necessary to agriculture. Agriculture existed and flourished thousands of years before agricultural colleges were ever thought of. Plants will grow whether we understand the method of their growth or not. They will feed themselves from the earth and air whether we understand the science of plant food or not. It has been known for ages that animal manures increase the fertility of the soil, and the general principles of cultivation have also been long understood. A few simple facts and principles like these constitute the basis of successful agriculture, and experience and common sense will furnish the best rules for applying them. Agriculture, then, is absolutely independent of the agricultural college.

We cannot say the same of surgery and medicine, or of law, or of theology, or of engineering, or of mechanical construction. Everything that can properly be called a profession or trade depends on scientific attainment or acquired skill, and an apprenticeship of some kind must precede capable work in every kind of mechanical occupation. The farmer's boy can scarcely fail to get a sufficient apprenticeship in farming on his father's farm; and, beyond this, energy, industry and good judgment are his best resources, though it must be admitted that successful agriculture makes an unusual demand upon their natural gratification. A good farmer must at least have good common sense.

But given this apprenticeship and these natural qualifications, what can the agricultural college do for the farmer's son? It is an easy inference and an easy mistake to suppose, because a law school is good to make lawyers, and a medical school is good to make doctors, that an agricultural school must be good to make farmers. And it is doubtless true that some of our agricultural colleges were founded upon this folly, implied if not expressly stated in the terms of the Morrill Land Grant Act.

There need be no question that science has done much for agriculture. It was a considerable gain when the elements of plant food were discovered together with the differing proportions required by different products, resulting in the preparation of special and general commercial fertilizers. But this was done by the chemist in his private laboratory, or in connection with a university proper, not in an agricultural college; and when the facts, however discovered, are once known, it does not need an agricultural college to teach them. There has not been so much gain from the analysis of soils, and all the desirable results in this direction can be obtained by the intelligent farmer through simple experiments on his own land.

Agriculture owes much to the entomologist; but if the said professional will tell us the natural history of the potato bug and flea beetle and other noxious insects so as to expose their vulnerable points, and if the chemist will tell us how and when to dose them, that is about all we want to know, and we can get all this from the published reports and the agricultural papers.

We can say about the same for the botanist, but probably not so much for the professor of veterinary medicine. His skill is not so easily communicated. Still if a farmer's son knows enough to take decent care of his animals, he would probably forget all he may have learned of veterinary medicine at college, before having an occasion to use it, and beyond a few simple remedies, would be foolish to trust his own skill if he did not.

If he wants to become a veterinary surgeon, or a professor of agricultural chemistry, or an entomologist, or a botanist, that is another thing and I have nothing to say about that. But to suppose one must become an adept in all these sciences before he can be a successful farmer, is nonsense of no ordinary kind. And to suppose he will be much more successful as a farmer because of such knowledge of these things as he will get in an agricultural college, looks very much like nonsense of the ordinary kind. All that farmers need to know of these matters they will easily get in the reports of experiment stations, and especially in the agricultural papers.

Having thus shown what the agricultural colleges are *not* good for, let us now consider what they *are* good for. If a young man studies botany at an agricultural college he unquestionably derives a certain benefit from the study, though he may never apply it in his business. He will get an educational, if not a practical benefit from it. He acquires a more intelligent understanding of things with which he is in daily contact. He learns to observe, to appreciate, to remember, to classify; and his mental power generally is enlarged by the study. He is a better man if not a better farmer; and he will enjoy his existence more and have a higher value and greater influence among his fellow men. The same may be said if he studies chemistry, or even bovine anatomy. His intelligence and mental capacity are developed by his efforts in all these branches of study. He will not be a much better farmer, but he will be a good deal more of a man.

Is it not a good thing, then, for a farmer to send his sons to an agricultural college? Of course it is a good thing; but generally, it is by no means the best thing; and a thing good in itself may become relatively bad when we compare it with things that are better. The chief value of study in an agricultural college, is, as we have seen, its effect in general culture; and for general culture other courses of study are vastly better, and might and should be equally accessible. Indeed the agricultural colleges were not established for general culture, and would never have been established at all but for their supposed beneficial relation to practical agriculture.

They are, to say the least, not necessary for the latter purpose, and are by no means the best for the farmer, being in this latter respect in no wise comparable to the usual academical course in other colleges. There is indeed one view in which the agricultural colleges are positively detrimental to agriculture. As at present managed, their influence is to take young men away from the farm, who would otherwise have been farmers. Take a boy from his father's house and farm at the period when his habits and tastes are most rapidly forming; dress him up like a gentleman and send him to college to mingle for three or four years with other boys similarly treated; even in vacation when he comes home as a visitor, coddle him with the notion that he has been studying so hard that he needs all the time for rest and recreation—for that is what vacations are for—and what have you done to make a farmer of him even if he has been spending these three or four years in this gentlemanly way at a so-called agricultural college? Not much surely. But you have done a good deal to give him a disposition to keep up his gentlemanly habits, and to keep away from the farm forever.

Now this is not a mere fancy sketch. It is rather a representation which can be backed up by solid facts. Of the nearly 300 graduates reported up to the commencement of the current college year at the Massachusetts Agricultural College, less than one quarter have devoted themselves to agriculture in any of its branches. Now it is a fair presumption that most of the young men intended to become farmers; else why should they go to an agricultural college? And the college instead of helping to make them farmers, actually took them away from the farm, and sent them into other pursuits. Of those who took only a partial course it is probable that a much larger proportion returned to the farm. Probably some of them staid at the college long enough to decide that what they were learning would be of little use to them as farmers, and so wisely went about their business without further delay. But is this the advantage to agriculture which our representatives in Congress expected when they devoted so many millions of the people's money to establishing agricultural colleges? Most assuredly not.

Well, it will, of course, avail little to mourn over or find fault with the past. People have generally to learn in the school of experience, and we shall not deserve such credit for wisdom if we fail to learn something from an experience as expensive as that which the history of our agricultural colleges furnishes. What then ought we to do? I will give my opinion as directly and briefly as possible:—

First. Turn the agricultural colleges into schools of general culture, assimilating their courses of study largely to the academical courses in regular colleges. If you cannot learn agriculture at a college, there are other things you can learn which will be even more important.

Secondly. But do not take the boys away from the farm even to learn these things. Let them understand that they can be just as much gentlemen, in the true sense, on the farm as in other pursuits, and that culture is just as useful and just as ennobling there as elsewhere. To this end let the college course be arranged so as to consist of at least four to six-months' winter terms, leaving the summers entire for other uses. The advantage of this arrangement would be that the boy would not be taken away from the farm long enough to acquire a distaste for it and a disposition to lead an easy, effeminate and, as he thinks, gentlemanly life. In fact, he would not be taken from the farm at all. He would be there every summer, and all summer long, helping his father with the extra zest and the acquired manliness that his winter's opportunity had given him. His tastes, habits, ambitions and opportunities would still be on the farm. Another and a very great advantage would be that the expense of a college course by this method would not be more than a quarter as much as by the usual method, and the college would be accessible to four times as many young men. Allow a boy fair wages for his work during the summer, and his savings would generally pay his expenses at college during the winter.

Thirdly. Turn the institutions now called agricultural colleges into farm schools and experiment stations during the summer. In these let every branch of agriculture be carried on and illustrated in the best possible manner, and let the work be done of preference, and, as far as possible, by young men who desire to become proficient in practical agriculture. Let these young men be paid as much as other men would be for the same amount of work.

There is much to be learned in market gardening, fruit culture and landscape gardening which cannot well be learned from books, and of which the ordinary farm furnishes no illustration. Dairying and the care of stock should also be exemplified according to the most approved methods, as also general farming in all its branches. To carry on all these departments of agriculture extensively, would furnish opportunity for the employment of a great many young men; and all who enjoy the privileges of the school should be expected to labor at least five hours a day and longer if they will. The other part of the day should be devoted to inspecting the various operations of the farm, garden and dairy with note-book in hand. No study should be required and no recitations be heard. The sole literary exercise should be one lecture a day, after dinner or before supper, devoted by the professor to an explanation of the reasons and principles of what is then going forward in the department under his charge. One season from seed time to harvest at a farm school of this kind, would be worth tenfold more to agriculture than a full four years' course at the ordinary agricultural college.

If any of our young men desire to become specialists either in agricultural chemistry, or botany, or entomology, or veterinary medicine and surgery, it would doubtless be well that provision should be made in the agricultural college for students of this class, unless it might better be done in the university proper; but such courses of study should be especial and optional, and should not be included in the regular course.

If our agricultural colleges could be conducted upon this plan, they would be of incalculable benefit both to agriculturists and to agriculture, and we should have no occasion to regret the vast sums which have been expended in their foundation.

BEANS AND BEAN VINES FOR STOCK.

Several Subscribers.—We understand that in the bean-growing sections of Western New York farmers feed quantities of beans to stock and that bean vines are also considered valuable as stock food. Will the RURAL tell us about it?

ANS.—Some idea of the magnitude of the bean-growing industry in Western New York may be gained from the following note from a single firm in Genesee county:

"We pick out from 2,000 to 3,000 bushels of damaged beans in the course of a year, which we sell to farmers for feeding purposes. These beans have to be picked out, one bean at a time, which will give some idea of the amount of labor required to accumulate this quantity of culled beans. We usually handle about 50,000 bushels a year, and employ from 50 to 75 hands hand-picking these beans from September 1st to May 1st. We have several bean-planters with phosphate attachments, which we rent to the farmers in the spring, and also several bean-pullers, which we rent to them in the fall, to assist in harvesting their crops. The culled beans are usually sold at 30 to 40 cents per bushel, which by making allowance for the quantity of waste material, such as stones, lumps of dirt, etc., makes the cost to the farmers about the same as corn would cost them. Many farmers prefer a good fair quality of damaged beans to corn at the same price. They are fed to sheep, in the natural state, or ground and mixed with corn meal, and fed to cows or boiled and fed to hogs, making excellent feed in all cases."

As everybody whose ancestry traces back to New England or New York State knows, the bean is one of the most nutritious forms of vegetable food. American agriculture would be considerably advanced if farmers at the West would substitute beans for a portion of their pork. Using beans as food for stock is a new idea to those who live outside of the bean-growing districts. It is the RURAL'S business to secure information. So we sent the following questions to a number of farmers who ought to be able to answer.

1. What kind of stock will eat beans?
2. Do you grind or cook them?
3. What quantity can you safely feed?
4. How do they compare in value with grain?
5. What do you feed with them?
6. What stock do best on beans?
7. Would it pay to grow beans exclusively for feeding purposes?
8. Are the vines of any value?

Here are the answers:

FROM ADDISON TERRY.

I have never fed beans to anything but hogs and store sheep. They were whole and raw, but one must be careful in feeding, for unless they are fed in small quantities, they will cause the scours. I think there is not much good in them for sheep; but there is no doubt that they are good for cattle. Milch cows increase their milk yield wonderfully if they start with about a quart mixed with corn-meal, and in one week they will eat them without the meal; the feed can be increased to eight or 10 quarts a day without doing any harm. I start hogs like cattle. After one week or 10 days I can give them all they will eat. Beans are worth half as much as corn as feed for hogs. In all cases they must be cooked as well as if intended for the table. Then I think one bushel of them is as good as one bushel of corn as feed for hogs, but boiling them takes time and wood or coals. For boiling them I have a kettle that holds 120 gallons standing on a kind of stove. It is under a shed on each side of which are the hog-pens. The water is conducted into the shed close to the kettle in a two-inch pipe so it is very handy. I fill the kettle half full of beans, then fill up till it is about two-thirds full of water and beans; let them stand overnight, and in the morning the kettle will be about full. I then build a fire and boil them until they are done, which will be in about four hours. If mixed with shorts, middlings or meal, it would be an advantage; but owing to the trouble in preparing them properly, feeding them hardly pays unless one has the right sort of appliances for the work.

Genesee County, N. Y.

FROM S. TAINTOR.

1. Beans are a favorite feed for sheep, both the seeds and the vines. 2. Without cooking or grinding. 3. A pint a day can be fed safely to a sheep. 4. They are equal to, I think, and more "hearty" than corn. 5. When I feed to hogs or horses I grind them, using two bushels of oats to one of beans—feeding three quarts of the mixture at a meal. 6. Sheep. 7. Marketable beans are too valuable to feed. 8. Cows and sheep like the vines and eat them up clean.

Livingston County, N. Y.

FROM GEORGE W. EASTMAN.

1. Sheep, cows and hogs.
2. To sheep we feed whole beans, while we cook them for hogs.
3. We begin by feeding lightly and after a few feeds, we feed them the same as corn.
4. They are richer than any of the grains.
5. We generally mix them with corn.
6. Sheep.
7. It would not.
8. The vines make an excellent feed for sheep or cows in connection with hay or straw. By refuse beans I mean beans the weight of which will not shrink more than six pounds per bushel if the stones, dirt and rotten beans are all removed. The value of refuse beans for feed depends upon the relative prices of beans and corn per bushel.

Wyoming County, N. Y.

FROM GEORGE F. LOWE.

1. Sheep, cattle, hogs.
2. Whole for sheep; ground for cattle; boiled for hogs.
3. One pint to four sheep, whole. For cattle

they ought to be mixed in the proportion of one-fourth of beans to three-fourths of bran or corn. Fattening hogs should get all they will eat cooked; for store hogs they might be profitably mixed with bran or corn, half and half.

4. They are worth more, pound for pound, than any of the grains.

5. Bran or corn.

6. Sheep and hogs.

7. No.

8. The vines or pods are worth as much as good hay, or more, for sheep and nearly as much as hay for store cattle.

The subject is one that might be profitably discussed, as a good deal might be learned by experience in feeding the beans and vines. Beans are never used as feed except they are damaged by wet, or heating, or some similar mishap. But beans should always be screened and hand-picked before they go to market, and the beans that are screened out and those that are picked out make feed. They are a stronger feed than corn or rye, being more nutritious than either; but they require more care in feeding, because if too many are given they invariably cause scours, and then they would be of little or no value; therefore they must be always given in moderate quantities, except when cooked and fed to hogs. Then they may be fed very liberally with the best of effect.

Genesee County, N. Y.

FROM F. A. HOGMIER.

1. Sheep, hogs and chickens.

2. I feed them whole to sheep and cook them whole for hogs and chickens.

3. I start with a very small ration, say, five quarts to 50 fattening sheep, and gradually increase until they get nearly all they will eat.

4. They are as good for feed as ordinary grains if they can be bought at the same price. Split and poor beans can be bought of dealers at a-half cent per pound. These are the only kinds we feed, as good beans are worth too much money to be used as stock feed.

5. They may be fed alone or mixed with anything else.

6. Sheep.

7. No—the beans are worth too much per pound in the market.

8. Yes—they are much better than hay and grain for sheep and cattle; but they must be fed very moderately at the start as they are very laxative. Beans may be ground and mixed with other grains at the choice of the feeder. The pods are very valuable for sheep which will leave the best of hay and eat the pods as though they were grain. My sheep have had nothing but pods all winter—not one pound of grain—and they are in much better condition than they were in the fall. The pods are fine feed for breeding ewes. When fed on them they always have plenty of milk. Beans are the most profitable crop we can raise. Feeders only use poor beans and splits from the pickers' table. There are thousands of acres grown here in Western N. Y. The yield is from 15 to 30 bushels to the acre.

Livingston County, N. Y.

FROM J. H. KENYON.

I saw in the RURAL a short time ago the statement that most sheep would eat beans whole, and then a ration for sheep of 100 to 120 pounds was given. Isn't this ration too great, or am I feeding my sheep too little? I have a flock of all ages that weigh from 120 to 175 pounds each (actual weight, no guesswork). I feed them half a pound of corn daily with what straw they can pick over—mostly barley straw—and this is all they get until they lamb and they are fat and healthy. Some of the single lambs weigh as high as 12½ pounds at birth, and twins 15 pounds, and the only trouble I have with their milk is in keeping their udders from becoming inflamed before the lambs get old enough to take the milk. During the past winter one ewe lost one side of her udder through neglect on my part after the lamb was one week old. In the last two years my lambs gained six pounds in seven days. I have not weighed any this spring, but they are as good as any I have had. About sheep eating beans—I had a few damaged ones which I mixed with the corn, and the only objection the sheep made was there was too much corn and too little beans.

Onondaga County, N. Y.

THE FLAT SCALE INSECT.

J. A. W., Portland, N. Y.—What are the insects on the inclosed orange leaf? By careful washing and hand-picking I can keep them only partially under.

ANS.—The insect is the common Flat Scale (Lecaninum hesperidum). It is a very common greenhouse pest of the North, and further south lives out-of-doors on a variety of trees and plants. At Washington it is one of the commonest greenhouse pests, and at the same time it infests the English ivy in great numbers out-of-doors. Like other scale insects, the female is wingless and degraded and moves about only during the early part of its life. After attaining full growth it remains in one position, inserting its beak into the plant and pumping up sap. The female undergoes but very slight metamorphoses and the newly hatched young is comparatively long-legged and is perfectly active; with each successive molt its limbs become shorter, but it changes little in general appearance. Contrary to the usual rule in bark-lice, the male is also wingless. For many years the latter sex was unknown. The best remedy is the application of a dilute kerosene soap emulsion made according to the Hubbard formula which has been often published in our columns.

IMPROVING A LAWN, ETC.

P. O. M., Galesburg, Ill.—1. The stand of grass on my 6x12-rod lawn is pretty good, though not so good as I want it to be. How can I improve it without digging up the ground, and what is the best time to do it? 2. Ought hard maple trees planted three years ago, and now seven feet high, to be trimmed?

ANS.—1. We should use chemical fertilizers—bone, blood, ashes, kainit or muriate of potash. Suitable combinations of these are put up by all fertilizer firms. Sow at the rate of 300 pounds to the acre now. In June sow again at the same rate during wet weather. In August sow again. It would be very desirable to mix the fertilizer thoroughly, before spreading it, with at least an equal amount of soil. This would insure an even distribution and prevent scorching in places. 2. No, not unless the branches interfere, or a lower, more stocky growth be desired.

Miscellaneous.

I. B., Blockville, N. Y.—The stock of Idaho pears is controlled by J. H. Evans, Lewiston, Idaho.

J. H. C., Jersey Shore, Pa.—The fish commissioners for Illinois are, N. K. Fairbank, Pres't, Chicago; Dr. S. P. Bartlett, Quincy; George Brenning, Centralia.

J. H. C., West Rutland, Vermont.—Is Breed's Universal Weeder valuable for weeding small corn where there are some small stones?

ANS.—We have never used this tool, but those who have used it are quite enthusiastic in its praise.

M. N. McN., Kirkwood, Ohio—When and how should grape-vines be girdled to induce the fruit to ripen early?

ANS.—It is only necessary to tie a strong piece of twine tightly about the cane to be girdled below the grapes. Do it when the grapes are as large as peas.

J. H., Kingston, Ill.—Mr. Terry says: "Keep the cultivator in the potato field until the tops fall down." A prominent seedsman and potato-grower in a friendly letter says: "Stop cultivation when the buds for blossoms appear." What is the RURAL'S opinion on the subject?

ANS.—The R. N.-Y. says also "Keep the cultivator going until the tops fall down"—but cultivate shallow.

W. T. McC., Blue Ridge Springs, Va.—1. What is the best breed of chickens, good health, good layers, good sitters, careful mothers, early maturity, good size and quiet disposition being the factors in the choice. 2. What is the most favorable season to procure eggs for hatching from dealers?

ANS.—1. We should select either Wyandottes or Plymouth Rocks. You will have to try both breeds in a small way before you can tell which is the better for your use. 2. You can start now.

S. N., Romeo, Michigan.—What is the best hand force pump for spraying fruit trees, and what chemicals are best adapted as insect destroyers on the apple and plum trees, small fruits, etc.?

ANS. 1. The Field force pump made by the Field Force Pump Company, Lockport, N. Y. Rumsey & Company, Seneca Falls, N. Y., make good spraying pumps. Paris-green or London-purple is generally used in about the proportion of one pound to 200 gallons of water for spraying apple, plum and other trees. For spraying currant and gooseberry bushes to kill the currant worm, white hellebore is generally used, a table-spoonful to a pail of water.

L. E. C., Bainbridge, Ohio.—1. What is the best implement for the level cultivation of potatoes planted according to the trench system? 2. Is harrowing with an ordinary straight-toothed harrow recommended, or does doing so pack the earth about the potatoes in the trenches? 3. Do suckers from plum trees bear fruit without grafting or budding?

ANS. 1. We use a Syracuse cultivator. It has horizontal blades in front and a shallow hoe behind. A cultivator to work just as we want it for the shallow cultivation of corn and potatoes is yet to be made. 2. We prefer for the preparation of the land the Cutaway harrow. This pulverizes the soil without packing it. 3. "Suckers" are much the same as other branches, except that they usually issue from the interior of the tree and are tardy in bearing.

DISCUSSION.

WATER IN AMATEUR GARDENING.

"AANI," STATEN ISLAND, N. Y.—I have found an ordinary garden or street sprinkling hose exceedingly useful in fruit, flower and vegetable culture. I have sufficient hose to reach over two lots—three lengths. I bought it, second-hand, cheap. It has more than paid for itself as an insect or pest exterminator. I use at times a spraying nozzle, and at other times a single stream nozzle. When the borers bothered my apple trees, I cut the bark, fastened the nozzle of the hose close to the hole, and let the water fly in there for an hour, taking care of itself. The borer never appeared after that wash-out. When the asparagus beetles get on the plants I start the hose up once a week, and give them the full and close benefit of the flying water. The spraying nozzle is held close to the infested parts of the plant. The force of the water I always send in an upward direction from a position close to the ground. The stream or spray strikes all insects unawares. They usually depend on the shelter of the leaves for protection from heavy rain storms. The water from the hose, "knocks them silly," as the boys say. I find that the asparagus beetles are carried 10 to 20 feet from the plant, and there they lie very limp on the ground. Of course, the beetles are not all killed; but the young ones never get back, and so by using the hose once a week I give the plants needed water in dry times, and have healthy-looking bushes. I let the water fly full vent, as close to the plants as they can stand without danger of breaking. The green fly, red spider and rose bug also bother me little after the hose has thumped them heartily. It keeps my rose-bushes clean and bright-looking. The tent caterpillars go the same way. I catch their colonies when very young, put the sputtering water on them, and soon the web is gone all but a tatter or two. The green currant worm, (not borer, but leaf-eater,) goes whizzing off the bushes under the same flying application. Low or dwarf peach trees, pear trees or plum trees are materially cleansed by an occasional "rapid-transit" ducking of their boughs. How the strawberry plants do thrive and grow under a thorough, persistent soaking from the spraying hose! The strawberry crops of none of my neighbors begin to compare with mine. I pick them four to a pint, seven inches around—both Sharpless and Downing. They have a heavy but friable soil, and row culture. The runners are nipped until August 15, and only enough young ones permitted to grow to replace superannuated veterans. The second best thing they get is commercial fertilizers, and the best of all is water, water, water! And then more water after that.

I do not pay much for this water. I apply a patent rubber cap to the faucet, which keeps the water running with good force, and so I don't pay $10 per year for water rent on a screw hose faucet. The attachment costs 50 cents and can be bought in any rubber goods store. Raspberry bushes treated liberally with water do not seem to yield so fatally to the new form of blight that threatens this delightful fruit.

I take good care of my hose and it has lasted three years already. Of course, farmers don't have public water-works to draw on; but thousands of market gardeners do. The same is true of wealthy city merchants' places in the rural or suburban districts. Just let them make nature's great element, water, their ally in fighting plant and shrub insects, and the results will be pleasing and profitable.

I forgot to say that the drenchings given the asparagus, while killing off all young beetles, cause a remarkable growth in stalks. The soaking is wonderfully good in dry, scorching August.

A grape-growing neighbor of mine has a surprise for the horticultural world next year in the form of a magnificent grape. The fruit is red and as big as a Shell-bark hickory-nut. There are few on a bunch, but the bunches are big. To eat it is to get grape jelly in a raw condition—nothing less. Beneath the skin there is a pulp that is thick, soft and saccharine almost, in its delightful flavor. I would not toss up a cent between eating a bunch of these grapes and the most expensive hot-house pets. The vine is a trifle woody, but no more than Pocklington, but the grape—well, I'll let the RURAL speak of it next autumn, after judging of its merits by "sampling" a specimen bunch.

ONIONS FOR STOCK.

T. D. CURTIS, CHICAGO, ILL.—On page 296, appear some comments by correspondents on the subject of feeding onions to stock, and the RURAL calls for other facts about feeding onions. When I was waiting for the train, last winter, after attending the Wisconsin State Dairymen's Convention, I fell into conversation, at the depôt, with a man who said he was engaged in gardening, and in conjunction with this ran a small dairy. He said that a few years since he had a considerable patch of onions that did not bottom well and were too small to market. When the other crops were harvested these were left and he turned his stock in, not thinking much of the onions. To his surprise, these were about the first thing they fell to eating. His milch cows among the rest indulged in a diet of onions. As was expected, the onions tainted the milk and the butter made from it. Marketing it was out of the question. So he suggested that each member of the family should begin the meal by eating onion. They did so and experienced no annoyance from the flavor of the milk or butter. As time rolled on, he thought the onion flavor in the butter diminished, and he ventured to take one tub of butter to market. He said nothing about the onions, but requested that the butter be carefully tested. It was pronounced fine and all right. The next time he went to the village, the buyer inquired if he had any more of that fine-flavored butter to sell. A lady friend, who was very particular, had some of the same make of onion-flavored butter, and soon called for more. A year or so later, he had several hundred bushels of small onions that he could not sell. He gathered them and fed them to his cows heavily. He went on selling his butter to his village neighbors and all spoke of the fine flavor of the article. Since then he uses his unmarketable onions in this way. He seemed to think that an occasional taste of onions by the cows manifests itself in the flavor of the butter in a disagreeable way; but that full and regular feeding only hightens the flavor without making it at all unpleasant. This is the first time I ever heard of feeding onions to cows.

BLACKBERRIES AND SEED POTATOES.

M. M., MEDWAY, MASS.—The Erie and Minnewaski blackberries are not hardy in this climate. I have had the Erie through two winters and the Minnewaski one winter, and nearly every cane of each kind has been killed to the ground. Had I known the truth as to the hardiness of these two blackberries two years ago, it would have saved me $25, which I was induced to invest on the assurance of those who have the plants to sell. I begin to think the word of no nurseryman can be depended upon concerning stock which he has for sale.

I see, in the RURAL of May 4, some remarks about keeping potatoes in cold storage to prevent sprouting. I have a cellar about 12 feet deep under my barn. It remains very cool late in the spring, so that potatoes seldom sprout much in it until late in May. I find that in the spring some of my potatoes are black inside. Such tubers have little or no vitality. Is the bad condition of some of these potatoes caused by a lengthy subjection to too low a temperature? The thought was first suggested to me on observing the difference in condition, one year ago, of the two parts of a lot of Polaris potatoes, some of which were stored in my cellar and the others in a neighbor's cellar. Many of those in my cellar were black inside, while those kept in the neighbor's were all sound, though some had sprouted.

FEEDING ONIONS TO STOCK.

F. H., WAYNE COUNTY, N. Y.—Mr. Whittemore, who in a late RURAL wrote about "Onions for Stock," cannot be very well posted on prices, if he never knew the price of onions to fall below 20 cents per bushel. In this county thousands of bushels of onions were buried or otherwise disposed of during the last winter and spring, there being absolutely no sale for them at any price. In the New York market large quantities were sold for 25 to 50 cents per barrel, less than enough to pay for freight, commission and packages. What Mr. W says may be true of Chautauqua county, but it certainly is not true of this county, or of any onion-growing district. In regard to "onions for stock," I have had no experience in feeding, though I know that stock will eat them. They are considered healthful and nutritious as human food, and why they should not be the same for stock feed I do not know. Onions are very healthful food for poultry, which soon grow very fond of them. They will prevent gapes in chickens, if fed chopped in the soft feed twice a day. They must, however, be discontinued

a few days before the birds are killed, or the flesh may be unpleasantly flavored.

"ANON" ON SEEDSMEN.

"SEEDSMAN"—"Anon" mentioned the instance of a seedsman advertising Northern-grown seed, who last fall purchased his seed corn 200 miles farther south. Well, what of it? Supposing said seedsman to be located in the far North, a difference of three degrees would not make his corn other than Northern-grown. I chance to know of one seedsman who has habitually raised his own field corn for many years, but owing to the failure of the crop by the frosts of early September, he could not get good seed nearer than 200 miles south of him the present season. Should a charge of dishonesty be brought against him? The fact that requires but a modicum of common sense to recognize is, that no seedsman who advertises Northern-grown seeds intends by that to lead the public to believe that he raises varieties that cannot be raised in his locality without costly petting, either as a rule or by reason of an unpropitious season. I agree with "Anon" that where vegetables do best there probably is the best latitude to raise seed from them. This rule would carry sweet corn, flint corn, potatoes, squashes and some other vegetables well into the North.

"THE LENGTH OF A PIECE OF STRING."

G. W. D., BIRMINGHAM, CONN.—Six grade Jerseys, two-year-olds, gave the following results last spring during the second week's milking, on second-quality hay together with one quart of meal and two of bran per day:

No. 1.	No. 2.
6 pounds of milk.	4 pounds of milk.
9 per cent. of cream.	15 per cent. of cream.
9 ounces of cream.	8 ounces of cream.
6 ounces of butter.	6 ounces of butter.
No. 3.	**No. 4.**
6½ pounds of milk.	10¼ pounds of milk.
8 per cent. of cream.	8 per cent. of cream.
10 ounces of cream.	8 ounces of cream.
7 ounces of butter.	7 ounces of butter.
No. 5.	**No. 6.**
6¾ pounds of milk.	7 pounds of milk.
16 per cent. of cream.	6 per cent. of cream.
6 ounces of cream.	6 ounces of cream.
5 ounces of butter.	4 ounces of butter

Compare these amounts, percentages and results, and well may the RURAL say: "What is the length of a piece of string?"

COLORING BUTTER.

W. P. W., NEW YORK CITY.—In the RURAL of May 4, it seems to be editorially assumed that the practice of coloring pale butter, "so as to cause it to appear of a golden yellow," is either a commendable one, like painting one's house, blacking one's boots, etc., or else of no consequence except to the individual colorists. If each manipulator consumed his or her product, then these conclusions would be correct; but when the product is intended for sale for others to eat, the case is entirely different, and the illustrations mentioned no longer illustrate. The practice of coloring butter and cheese is dishonest—just as much a fraud as selling butterine, or oleomargarine, for pure butter. The only object in doing it at all, is to deceive the purchaser and make him pay a higher price than he would pay for the uncolored product. When I purchase butter or cheese, I most emphatically object to having it mixed with dyestuff, harmless or otherwise, and I do not think I am alone in my objections.

SAW-DUST AND POTATO SCAB.

E. S. G., GENEVA, N. Y.—I see that "W." of Tyrone, Pa., states in a late RURAL, that he found that saw-dust after having been used as a mulch for raspberry plants, appeared to protect potatoes from the scab, while a Montreal correspondent, writing previously, had occasion to believe that saw-dust tends to increase the scab. Last season a large number of materials were tested at the New York Agricultural Experiment Station in the hope of finding a remedy for the scab. Potatoes grown with saw-dust in the hills were more injured by this disease than those receiving any other treatment, and were much more affected than those receiving no special treatment. The saw-dust in this case, however, was fresh. It may be that saw-dust that has been exposed to the weather a few months would act very differently. I have known of others who claim to have used saw-dust with success. I hope that readers of the RURAL who can obtain old saw-dust will make the experiment.

PROTECTING PLANTS FROM THE CUT WORM.

H. T. L., BRIGHTON, CAN.—On page 295—Fig. 103—I noticed a device for protecting cabbage and cauliflower plants while young from cut-worms. The only fault I have to find with this device, is that it would require too much time to make a sufficient number. The following is a device I have used very successfully for all kinds of young plants requiring protection from cut-worms. Take a piece of 2x4-inch scantling (basswood is the best, for it decays as soon as it is plowed under) set a good sharp plane to cut a pretty thick shaving, say one-sixteenth of an inch. This will naturally curl. Make as many as required. Have a dish of tar ready; dip one edge of the shavings into the tar and run them on a stick. Place one over each plant, and give it a little twist and it will work far enough into the ground to keep it in place. The cut-worm may climb up the fence but it won't pass the coal tar. A good boy will dip and set 1,000 or more per day.

INDEBTEDNESS OF LAND-GRANT RAILROADS.

S. B. H., CRAWFORDSVILLE, IND.—I am interested in the articles contributed by Mr. Chamberlain. The same idea could be continued in reference to the land-grant railroads, and the Union and Central Pacific. Those roads will owe the people of the United States at least $125,000,000 by the time the bonds become due. They are already at work in Congress to extend the time of payment 50 years at two per cent. The farmers of this country should insist that those roads shall go into the hands of a receiver when the time of payment to the Government shall have arrived, if they are not able to discharge their debt, which they will not be.

THE WILLOW TWIG APPLE.

J. J. B., TITUSVILLE, N. J.—When we have a good thing in the fruit line we ought to let our neighbors know of it. As we have this in the Willow Twig I wish all to know; 1, that the fruit is medium or perhaps below in quality for dessert, but good to cook; 2, that the tree is a good early bearer of fair-sized apples, a good but not a strong grower; 3, with ordinary care the apples are now in good condition for market, and do pretty well for eating without cooking. It is an apple sure to pay if planted in New Jersey or in similar soil and climate whether used at home or grown for the market. Good apples are not very plentiful at this time of the year—May 6.

HERE'S A GOOD JERSEY.

A. C. W., SCHRAALENBURG, N. J.—The RURAL'S articles on "how many pounds of milk are required to make a pound of butter," attracted my attention, so, on Saturday, I weighed the night's milk from my five year-old Jersey cow, and set the 17 pounds in two tin pans in a cool cellar. On Monday afternoon my wife churned the cream, (the milk was still perfectly sweet,) and made 19 ounces of as fine butter as I ever saw. This cow was fed on Saturday morning with two quarts of mixed oats and rye meal and bran, about equal parts, and had good pasture with plenty of well water.

ANTI-CRIB-BITING.

L. W. R., BENTON HARBOR, MICH.—The R. N.-Y. of May 4, contains at least three inquiries about cures for crib-biting in horses. A neighbor of mine, instead of using a halter on his horse, buckles a strap tightly around the neck and the horse is unable to suck wind while he has it on. In this case the strap is deeply imbedded on the top of the horse's neck, but this might be prevented by using a zinc collar-pad, which would protect the top, while the necessary pressure is brought on the windpipe.

What Others Say.

SAMPLES.

THE BREEDER'S GAZETTE remarks that when Short-horn bulls, unceremoniously pulled away from the maternal dugs in Aberdeenshire, hustled 3,000 miles by sea, quarantined for 90 days, railroaded another thousand miles, and sent into the sale ring at the age when they would appear at their very worst, even had their treatment been of the very best—can be sold at an average of about $400 per head there would seem to be some very clearly-defined public sentiment upon the subject of the future of the Short-horn in the West.....

JOHN GOULD, alluding to the proceedings of the late Silo Convention at Cleveland, Ohio says in the Philadelphia Press, that the wooden silo in some of its forms was voted the favorite. The evidence seemed conclusive that the wooden silo was nearest frost-proof, kept its contents in the best state of preservation, and if properly built and painted with some good wood preservative it would last for years The silo, with lathed and plastered interior, was also largely indorsed, while those who had the double-boarded silos painted with gas-tar or asphaltum paints declared them good enough. Not a man voted for stone or concrete silos, although several who had such were present.....

IT was believed by many that the man who built a good-sized silo, and used silage along with the other feed raised on the farm, had been enabled to double his stock. This has proven over and over again that succulent food could be fed in the winter with manifest profit, if warm barns and stables were provided. That silage fed judiciously made "good, rich and healthy milk" was attested to by Dr. Ashman, the city health officer of Cleveland, after 3,000 examinations of milk. That cows had eaten silage year after year and were still healthy and in "possession of their teeth" was shown to be true. That any ill effects from silage feeding could be shown was not attempted.....

A TEST of THREE DIFFERENT CHURNS, was made at the New Hampshire E. S., viz., the Blanchard, Stoddard and Davis. The results show that there is practically no difference in their efficiency, and if there is any preference it must come from convenience in handling, and ease of operation. On this point there is no doubt in the minds of those who actually operated the churns at the Station. For ease of handling and cleaning, and for perfect granulation of butter the Stoddard churn stands at the head. The Blanchard is open to the objection that it has inside floats, which interfere seriously with the granulating of the butter. The Davis is harder to operate than either of the others, and is more difficult to clean when the churning is done. The average time of churning was 24 minutes for the Davis, 47 minutes for the Blanchard and 29 minutes for the Stoddard. The Davis leads in point of time required.....

IN the common practice of buying cream by the "gauge," it is supposed that the product of cream in butter is uniform. In experiments made by the Kansas Agricultural College, cream was the one discordant element. In the case of every cow employed, and with each kind of feed, the milk giving the largest display of cream often gave the least butter product, and the reverse. As far as could be judged, the character of the cream varies quite as much as the milk does in its original condition. Milk showing eight per cent. of cream gave a larger yield of butter than was obtained from milk giving 10, 11, 12 or even 13 per cent. of cream.....

THE truth is, says Prof. Shelton, that the man who buys the milk of a large number of herds, good, bad and indifferent, paying for it by the gauge of cream which it yields, is probably not greatly the loser or gainer thereby. Experience has taught him the amount of butter he has reason to expect from the composite cream; but the loss to patrons, especially those whose herds have been bred up in dairy lines, must often be very great in the averaging process. The farmer whose Jerseys gave 9 1-2 to 10 per cent. of cream, yielding nearly five per cent. of butter, must, if all patrons are paid alike, contribute in the course of a year a very pretty sum towards the support of his neighbor's herd of scrubs, which gave nearly 11 per cent. of cream and only 3¾ per cent. of butter.....

BULLETIN 48 from the Michigan Agricultural Experiment Station gives some very interesting information regarding potatoes, squashes and tomatoes. It speaks of Coy's No 88 (now Burpee's Superior) as follows: "Tubers all marketable and very even in size; very smooth and regular, with ends abruptly rounded. Eyes few and near the surface. Season, medium. In quality one of the very best. Flesh white and mealy when cooked. The most productive and promising potato grown the past year."..... ....

OF the R. N. Y. No. 2 it says: "All of good size. In form nearly as broad as long and flattened. Skin, white; eyes few and inconspicuous. Generally very smooth and regular, although an occasional prong manifests itself. Flesh white and mealy when cooked. This potato is quite productive and is an extremely valuable variety. Had it been grown under better conditions it might have headed the list. Well worth planting."....

NEW QUEEN proved to be "a fine-looking potato of excellent quality, though not productive."..... .....

JUNE EATING is pronounced "a very promising early variety."..... .....

WORD FOR WORD.

——WEEKLY PRESS: "Sweet or ripened silage can only be made from fully grown and mature fodder, the grain of which has begun to glaze. The juices of such fodder are *more* than water, and these juices when the fodder is cut are so charged with starch, etc., that they tend to preserve the fodder, and fermentation can not go as far or attain so high a degree of heat as when less mature fodder is siloed. The filling can be more rapid with mature fodder and as good or better results secured."

——WINNIPEG FARMER: "A STIRRING SUBJECT.—A. L. Crosby says: stir cream, and stir cream, and stir it frequently; John Boyd says: don't stir it at all after mixing the two skimmings of each day with his famous 'starter'; John Gould says: stir the cream while it is ripening; Hiram Smith does not believe in stirring cream. Strange how dairy doctors differ, and stranger, withal, that each and all of these gentlemen can make prime gilt-edged butter."

——DOCTOR TALMAGE: "For the Lord's sake, and for the sake of the harvests and the orchards and the gardens, of which they are the natural defenders, let the birds live."

——NEW YORK HERALD: "THE NATIONAL DEBT shrank during the last fiscal year by about one hundred millions. Sixty millions of people, twice that amount of contentment, vim, dash, chain lightning and happiness—where can you find a grumbler? If he shows his head above the fence, shoot him on the spot."

——O. C. FARMER: "If our national legislators, instead of hatching new schemes for spending the hundreds of millions of dollars now lying idle in the Treasury, would labor harder in the direction of paying the national debt, we would be much pleased with them. Buy the bonds, even if the premium is large. Wipe them out as fast as possible and stop the interest. Then let us get along without a debt. A national debt, like any other debt, is an unqualified curse."

——MAY CENTURY: "FOR many natures it is as much a duty of cleanliness to change opinions as to change clothes."

——"TO owe gratitude oppresses a coarse nature; to receive it, oppresses a fine one."

——"COWARDICE is the greatest giver of alms."

——"TRUTH has never yet proved fatal to any one; there are too many antidotes."

——NEW YORK TIMES: "Recent sales of Jersey cattle show that bottom prices have been reached and the reaction from an unhealthy excitement is at its zero. It is a time for farmers and dairymen to pick up stock."

——AMERICAN GARDEN: "The RURAL NEW-YORKER is doing a good work in inducing farmers' wives to take more healthful outdoor exercise, by competing for prizes offered for the biggest yield of potatoes on small plots of ground. We welcome any effort that has for its object the drawing of country women out of their houses into the fresh air that is so plentiful all about them."

——TROY TIMES: "There are many reasons why stock farmers should be men of good breeding."

Horsford's Acid Phosphate
A Nerve-Food and Tonic.
The Most Effective yet Discovered.—*Adv*

Miscellaneous Advertising.

Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

JOHNSON'S ANODYNE LINIMENT ESTABLISHED 1810.

For Internal and External Use.

Stops Pain, Cramps, Inflammation in body or limb, like magic. Cures Croup, Asthma, Colds, Catarrh, Cholera Morbus, Diarrhœa, Rheumatism, Neuralgia, Lame-back, Stiff Joints and Strains. Full particulars free. Price 35 cts. post-paid. I. S. JOHNSON & CO., Boston, Mass.

THE late Dr. Dio Lewis, in speaking of Warner's Safe Cure, said over his own signature: "If I found myself the victim of a serious kidney trouble, I would use Warner's Safe Cure." He also said; "The medical profession stands dazed and helpless in the presence of more than one kidney malady."

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, MAY 25, 1889.

Read Prof. Porter's views as to what agricultural colleges are good for.

BONE AND UNLEACHED ASHES.—They are first-rate for *all* crops. This combination is a *complete* fertilizer, but a little deficient in nitrogen.

ONE of the most promising new varieties of strawberry growing in the Rural Grounds is one sent to use by T. V. Munson, of Texas. Should this berry toe the mark, after a sufficient trial, it will be called Parker Earle.

LATEST as to the Flea-beetle. On the morning of May 17 the fleas were seen to be thicker than ever and many leaves badly perforated. Half of the Contest Plot was sprayed with the Bordeaux mixture made as follows: Half a pound of copper sulphate dissolved in hot water and two pounds of lime added to two gallons of water. This was first run through a fine sieve so as to insure its not clogging the nozzle. The other half was sprayed with water in which three ounces of bitter aloes were dissolved. The lime of the Bordeaux mixture is evidently injuring the leaves. The Flea-beetle seems to relish both mixtures.

EX-MAYOR HEWITT is in Europe studying the basic process of manufacturing steel. He tells an interviewer that he believes this process will be largely employed in America before 10 years and that it will eventually supersede all others. This means not only cheaper and better steel, but it means a great addition to our supply of phosphoric acid available for fertilizing purposes. In the basic process the phosphorus is removed from the iron. Phosphate meal, Thomas slag, etc., are names given to this residue in England, where it has been found to contain from 20 to 35 per cent. of phosphoric acid.

FOR several years past R. N.-Y. readers may recall that we have spoken in high terms of praise of a white grape which was sent to us four years ago by David Bundy, of Colerain, Ohio, for trial. As it behaves at the Rural Grounds we regard it as the best native white grape in cultivation, all things considered, and one which, it may be presumed, will adapt itself to a wide range of country and climate. We have never seen the variety alluded to in any other journal, and are glad in this instance, as we have had occasion to be in many others, of being the first to bring to public notice what promises to be a novelty of the first merit.

We learn that a company is being formed to introduce the Colerain, as the new grape has been named.

"I am sure that when the seed is allowed to ripen, the amount of digestible nutriment in millet is reduced one-half. It makes very poor hay. When cut while the plant is coming into bloom, millet makes excellent hay which is good food for any kind of stock."—COL. F. D. CURTIS, page 329.

ABOUT the only new hay plant that is just now demanding extra attention from farmers is Alfalfa. It is certain that the plant is very valuable at the South or in the dry, hot regions of the West. Reports from the North and East are still somewhat contradictory. Here is one just received from the Michigan Agricultural College.

"The cold weather which we are having this spring, especially during the past week, has injured the Alfalfa very much. Some mornings it looks as though it would never revive again, although there had been no frost. Our common clover in an adjoining plot does not seem to be affected in the least by the cold. After a week of cold, northwest wind which we are having, the Alfalfa looks quite yellow and some of it is killed to all appearances. I think the great problem is to get it through the first year successfully."

HELP, Entomologists! The R. N.-Y. calls for help for hundreds of farmers and gardeners as well as for itself whose potato vines are thus early being destroyed by the Flea-beetle. Prof. Riley (United States Entomologist) insists that Paris-green water, if sprayed on the under side of the leaves, will destroy them. We have tried this thoroughly and make the positive assertion that it will *not* destroy them. The R. N.-Y. during the past two weeks has tried Paris-green, crude carbolic acid, sulphuric acid, thymo-cresol, hellebore, pyrethrum, tobacco water, tobacco-soap water, whale-oil soap water and several patent compounds which need not be mentioned. We can not see that any of these or various combinations of them either harm or drive them away. Look to your potato leaves. You may not see the little dark beetle in great numbers, but if the leaves are partly or wholly perforated with little holes as big as pin heads, be sure he is there. These perforations soon destroy the leaf tissue, the leaf withers and the plant suffers proportionately.

GREAT BRITAIN is rapidly following the example of the United States in the formation of trusts. The number organized during the whole of last year was only 15, with a total capital of less than $50,000,000; but during the first three months of this year, according to the London Economist, 19 new associations have been formed, with a total capital of about $125,000,000. It is alleged, however, that some of these are little better than confidence games got up for the purpose of beguiling money from the pockets of the public into those of the schemers. They are all floated, however, with a facility which unmistakably betrays a superabundance of idle capital or amazing gullibility in the British Isles. Has anything of this kind been done on this side of the water? Why, certainly. Thousands, yes, probably millions of dollars have been enticed out of the pockets of the public into their own by the promoters of various trusts, which promised enormous profits for the few at the cost of the many, but which can never fulfill those promises. Already in England there are grave fears of the collapse of many of these wind bags, and the Government is strongly urged by long-headed financiers to put an end to these schemes, which, at the best, must be adverse to the public welfare.

ADDITIONAL NAMES.

THESE are more names of those who have entered for the Women's Potato Contest.

Mrs. Alexander Sneddon, Lancaster Co., Nebraska.
Mrs. C. McIntosh, Brant Co., Canada.
Mrs. V. W. Griblin, Greenwood Co., Kan.
Mrs. F. Dick, Washington Co., Minn.
Fannie Dick, Washington Co., Minn.
Theodoria Dick, Washington Co., Minn.
Mrs. G. S. Paine, Kennebec Co., Maine.
Mrs. C. M. Grossman, La Grange Co., Ind.
Mrs. Selinda E. Jones, Chautauqua Co., N. Y.
Mrs. Daphne Martin, Posey Co., Ind.
Mrs. Anna A. Hay, Butler Co., Pa.
Mrs. G. Drew, Macoupin Co., Ill.
Mrs. Lavina Robinson, Marshall Co., Ind.
Mrs. Geo. A. Newcomb, Cattaraugus Co., N. Y.
Mrs. Hannah A. Morton, Wright Co., Iowa.
Mrs. Josie Lawrence, Jefferson Co., Iowa.
A. Boorda, Warren Co., Iowa.
Miss Alice E. Wysor, Pulaski Co., Va.
Mrs. A. F. Mase, Audrain Co., Mo.
Mrs. Angeline Winslow, Yamhill Co., Oregon.
Mrs. Wm. Y. Wilbur, Cumberland Co., Maine.
Mrs. Orson Grover, Hillsdale Co., Mich.
Miss Helen Wheeler, Jerauld Co., Dakota.
Mrs. Wm. Sherwood, Tioga Co., N. Y.
Emily Cockeram, Dunn Co., Wis.
Fannie Cockeram, Dunn Co., Wis.
Mrs. G. Y. Wimmer, Coffee Co., Tenn.
Mary V. Lishy, Adams Co., Pa.
Tillie F. Lishy, Adams Co., Pa.
Mrs. E. McMahon, Beaver Co., Pa.
Mrs. E. C. Dodge, Dane Co., Wis.

SOMETHING NEW.

THE R. N.-Y. has always been very successful in securing the opinions and experience of practical farmers. It has come closer to the farm and to actual farm work than any other agricultural paper. It has made a business of gathering the opinions and experience of those who do actual farm work. Examine any number of the RURAL and see how many articles it contains that bear the indelible stamp of practical agriculture. We now propose to go a wide step in advance of any former feat of agricultural journalism, and call to our aid the wonderful resources of photography and photo-engraving. We are prepared to print life-like pictures of interesting animals and objects just as we now print reports of farm methods and experiences. For example, we are printing reports from some of our readers who are testing their cows in a simple manner. These reports are instructive because they show how many pounds of milk are required to make a pound of butter, and this will go to show farmers whether their cows are above or below the average. Valuable as these comparative records are, it can be readily seen that they would be still more valuable if life-like pictures of the cows could be given. This is exactly what the R. N.-Y. proposes to encourage its readers to do. We have always been glad to have our readers tell us how they proceed to make farming pay; now we invite them to show us the sort of cattle, horses, sheep, etc., they are raising, the sort of homes they live in and the appliances they find helpful.

Photographs are now quite easily obtained in almost any locality. By means of the new processes of engraving, plates can be made directly from the photograph, so that we are able to print an exact likeness of the object photographed. The R. N.-Y. takes pleasure in making this new departure, and hopes its readers will take advantage of it. The R. N.-Y. is *the first paper in the world to propose such a thing.* It will cost a large amount of money, but if the plan will help to make any clearer the RURAL'S right to the title of "the best agricultural paper in the world," we shall be amply compensated. We shall be glad to hear from those who can send us photographs.

THE RURAL NEW-YORKER'S NEXT POTATO CONTEST.

THE LIST OF JUDGES COMPLETED.

IT is proposed that the potatoes of the next "Contest" plot be dug on the last Friday of September next. The plot will be more than twice the size of last year's plot, and the effort will be, as then, to raise at the rate of over 700 bushels to the acre. The following gentlemen have consented to act as judges:

LIEUT. GOV. EDWARD F. JONES, N. Y.

PROF. GEO. H. COOK, Director of the N. J. Agricultural Experiment Station.

L. H. BAILEY, Professor of Horticulture at Cornell University.

Dr. BYRON D. HALSTEAD, Professor of Botany, at Rutger's College, N. J.

E. H. LIBBY, Editor of the American Garden, N. Y.

E. L. COY, N. Y.

HON. JOHN A. WOODWARD, Pa.

J. S. WOODWARD, Secretary of the New York State Board of Agriculture.

PROF. HENRY E. ALVORD, Director of the Maryland Agricultural Experiment Station.

COL. F. D. CURTIS, New York.

HON. EDWIN WILLITS, Assistant Secretary of Agriculture, Washington, D. C.

WILLIAM FALCONER, "Dosoris," Glen Cove, L. I., N. Y.

E. G. FOWLER, Editor of the Farmer, Orange County, N. Y.

HON. J. G. WEBB, Justice of the Peace, N. J.

It is conceded on all hands that the R. N.-Y's "potato work," as it may well be called, has stimulated an interest in the culture of potatoes never before known. No less than 900 women pretty well distributed over the entire country, as shown by our published list, (a perfected list will be printed in the Fall), are now striving to show the possibilities of this farm crop which ranks, in money value, scarcely less than that of grass, wheat or corn in those sections well adapted to its culture. The R. N.-Y. "Contest Plot" has this year received at the rate of but 1,000 pounds of fertilizer to the acre, and the time and trouble of planting and cultivating the plot, will be no more than any farmer can afford to give to his fields, if, by the RURAL'S method of culture, heavy crops can be secured. We hope to raise on this plot over 20 *bushels* of potatoes, or more than one-eighth of the yield ordinarily produced by those who consider themselves good farmers, on an *entire* acre. Let us see, friends. In view of all this, the R. N.-Y. has been careful to select good and prominent men to see the crop dug, to weigh and estimate the yield, to the end that all who see their report may *know* that it is one to *command* their confidence.

"He may rest assured that if his soil be light and sandy, the harrow will work him sorrow and tribulation; but if, on the contrary, it be heavy and inclined to clay, the harrow will not only help in fitting the soil, but will aid immensely in hurrying on the work and in saving time."—A. T. T., page 332.

R. N.-Y. Is this *your* experience?

BREVITIES.

BEAN growers in Western New York use bean vines for stock food. They are considered best for sheep.

CAN we cure weeds with such care that they will make better fodder than the best grasses poorly cured?

WILL any farmer kindly tell a good reason for stepping on the seed potato after it is dropped in the hill or drill?

I REGARD the RURAL NEW-YORKER as the very best of the journals of its class.
PROF. JAMES F. BABCOCK.

THE future home of the baled-hay industry lies in the Northwest. It will follow wheat to the point where the best product can be produced.

ONE heaping tea-spoonful of pure Paris-green to a pailful of water for the potato-beetle, or one pound to one barrel of plaster, if intimately mixed, will kill as well as a larger quantity of the poison, which is liable to injure the leaves more or less.

HAVE the apple blossoms fallen? Then spray the trees with water and Paris-green—about one ounce to five gallons of water. London-purple is more readily held in suspension, costs a good deal less (15 cents a pound) and contains about the same per cent. of arsenic.

IN England, Rye grass, rape and other forage plants are being boomed. Little is said about these plants here—a good many wise men wonder why not. It should be remembered that corn is a wonderful crop in this country; while in England it is merely a plant to be experimented with.

IF you would have fine melons, dig wide holes; then mix a liberal quantity of old farm manure with the soil as it is returned. Compact the soil and plant all the way from a dozen to 20 seeds, if you have plenty and thin out to two or three. Have the hills for watermelons 10x10 feet; muskmelons 6x6.

READERS of the R. N.-Y. in all sections are asked to examine their potato vines to see if they are or are not attacked by the Flea-beetle—the little black, jumping insects to which frequent allusion has been made in these pages during the past year. A history, with illustrations was given last fall, page 546. As was then shown by the R. N.-Y., many cases of supposed "blight" were really caused by these nimble little imps.

LAST year we picked out six of our best hens and put them into a small pen with a good rooster. We set 52 eggs from this pen and 48 of them hatched. This year we have tried selecting eggs from several yards where several roosters run with large flocks of hens. The result is very disappointing, as a large proportion of the eggs prove infertile. Hereafter all our eggs for setting will come from a small pen of our best hens mated with a rooster of good form and breed.

DELEGATES representing the 10 cotton States, met at Birmingham, Alabama, May 15-16. A representative of the jute bagging trust offered to make a contract for bagging at 10½ cents per pound. This proposition was not sustained, and the convention "resolved" to use cotton-bagging to be manufactured in the South, and to demand from purchasers and manufacturers an allowance of at least eight cents per pound on each bale covered with cotton bagging. The cotton bagging costs 12½ cents per yard weighing three fourths of a pound.

Farm Topics.

HOW A DELAWARE FARMER HANDLES MANURE.

Location and soil of the farm; stables and pig-pens retentive of manure; the latter all hauled out in spring; manures for corn and for wheat and oats; mode of application; frequent cultivation; rotation of crops; horse manure, commercial fertilizers; "how to make farming pay."

THE making of manure, and the best mode of using it to get the greatest results with the least amount of labor, are themes that should interest all practical farmers. The question is often asked of me by my neighbors: "What do you do for the land to get such good crops?" While my methods will not suit every one, it may be well to tell others how I do it, so that it I am wrong they can correct me, and by talking the matter over, some good ideas may be developed, that will be of practical advantage to some one.

My farm is situated in the lower end of Delaware, five miles from the town of Seaford. The land is composed of a mellow loam, with a clay bottom, and is as level as a floor. My cattle stables and pig-pens are dug out down to the clay and made basin-shaped so that they will hold water. The rains and liquids from the stock keep the pens wet, and we keep them dry by hauling in leaves, sawdust, corn-stalks and rubbish from the farm. We keep up a constant fight right on this line. Sometimes the weather gets the best of us for a time, and then we conquer by hauling in more leaves and sawdust, until the pens are in good order again. The excess of water from rain will evaporate, leaving the concentrated juices in the manure. All this manure is allowed to accumulate until spring, when we have some hundreds of loads to haul out. Now, it is conceded that fresh "pound" manure is best for corn, while composted manure is better for wheat and oats.

To get the benefit of the fresh manure for the corn, and to save the labor of composting for the other grains, and to get the best results, I first turn over a clover sod for corn, and before harrowing it, haul the manure from the pens and spread it, broadcast, on the plowed ground, then harrow in the manure by going over it once with the Acme. Then I mark out the rows, plant the corn and when it is two inches high, put in the cultivators, and keep working it until the corn is too large. I usually go through it from six to eight times before it is laid by. Then, by cultivating the corn, the manure gets thoroughly mixed in the soil, and by fall it is well rotted. When manure is spread on the land before plowing, it is held in lumps and bunches, and does not get distributed through the soil enough for the plant roots to get the full benefit of it. In the first week in October, a portion of the corn ground is cleared, and put in wheat, and the remainder is sown with oats in the spring, and both wheat and oats are sown with clover in the spring. No other manures are used, and the consequence is that all during the summer the corn and wheat stalks are green from the ground up, instead of being burned, as they would be in a dry season if manured with superphosphates.

I think that by working the manure into the ground while cultivating the corn, it will be in much better condition for the coming wheat and oat crops than it would be by the usual way of plowing under the manure, and it saves the labor of composting for the other grains. The year following the wheat and oat harvest, we mow off a heavy crop of clover, and the following spring turn over this sod for corn, and so keep up this rotation.

"What do I do with the horse stable manure?" I throw it into a heap, and turn it over once a week to prevent it from burning, and at different times during the year, spread it around fruit trees, or manure potatoes with it, and in the winter, when the ground is frozen, I spread a light covering of it on the wheat, and use it in the vegetable garden.

"What is the size of the farm?" One hundred and forty five acres in all: 45 acres are in timber, and all the rest is kept in thorough cultivation, except the clover fields. Four years ago this was a poor, worn-out farm; now it is like a garden spot.

"Do I ever use artificial fertilizers?" Yes, but only in a small way. For root crops, such as turnips, in the fall when there is apt to be plenty of rain, it is just the thing; but if you want to enrich the land use plenty of "pound" manure and clover sod. Instead of sitting around the store stove during the winter months and preaching that "farmin' don't pay," keep your teams busy hauling any kind of absorbents for the cattle and pig pens. Don't drain them off, to keep them dry; fill them up; keep at it all the time. Let the store alone, except when you go to purchase something, and employ every spare hour in manufacturing manure, and you will not only improve the farm, but the money that you will save by doing with less "phosphates," can be better spent by the wife when she wants to make purchases at the store.

SAMUEL BROWN.

Market Notes.

"ARE the low prices of fruit the result of over-production, or under-consumption?" asked the writer of a commission merchant of many years' experience. "Both; while the supply of some certain lines of fruit is greater than the market demands, the lower classes do not consume the fruit they ought to do. I have seen a man pay five or 10 cents for beer or tobacco, and when asked by his children to buy them some apples, say: 'Oh! I can't afford it.' It is pure selfishness. The parents would rather spend their money for that which is positively injurious to themselves, than to spend it for healthful fruit for their families." There isn't a day in the year in this city but some kind of fruit can be bought so cheap that it seems as though the poorest might indulge.

Provisions of all kinds are plentiful, and comparatively cheap. Meats are somewhat higher than during the winter, but fish are in good supply and at reasonable prices. With heavy arrivals of early vegetables from Bermuda, Florida, the Carolinas and Norfolk, supplemented by hot-house products, and some from near-by gardens, to say nothing of last year's leavings, the house-keeper is right in clover. Asparagus is of very good quality, and is now retailing at from 10 to 15 cents per bunch. It comes from Long Island, New Jersey and Norfolk, mainly. Lettuce is in great profusion from near-by farmers. Four to six bunches of radishes can be bought for a nickel. Cucumbers cost five cents each, while a half peck of green peas can be had for a quarter. Good tomatoes are shown, while some had the appearance of being picked green, and were likely to remain so. Cabbages are good, likewise summer squash, beets, string beans, and onions.

Good apples are not in large supply, and are readily sold at good figures. Oranges are growing scarcer and higher in price. Strawberries are not so plentiful, but as they will be due from South Jersey in a few days, the price will soon drop. Other tropical fruits are plenty and cheap. Pineapples bring from 10 to 35 cents each, while hot-house peaches can be had at 50 cents each and upwards. California cherries bring 75 cents per pound There is a heavy stock of butter, and prices are likely to go still lower.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

HOW do you intend to do your house-cleaning—in an orderly, somewhat leisurely manner, or all at once? We have been noticing one of our neighbors and her method. She began with a bed-room one morning, rooted out everything from a big clothes-closet, kalsomined and scrubbed the closet, and hustled the things right back; then took up the bed-room carpet, and started on that room. She scrubbed everything, kalsomined walls and ceiling, had the carpet down before tea-time, and slept in that room the same night. Now, she was, no doubt, a smart and expeditious housewife, but we don't believe that room was either dried or aired properly, and if we hear of sore throats or unexplained colds in that family we shall lay them all to that house-cleaning mania. As soon as this bed-room was done, the housekeeper started on the parlor; that was done with equal expedition, and the day following the dining-room was attacked: in fact, the work was kept straight on, without any intermission whatever. Of course, the family was uncomfortable; there was no sociability or pleasant, restful, home life; but that woman did *all* her house-cleaning before any of her neighbors.

* * *

CLEANING one room at a time with a little needed rest between times, has been preached often enough in the RURAL. It is a time-worn topic, and yet it cannot be too often insisted upon. The sooner women learn that it doesn't pay to kill oneself, the better. Nor is the most perfect housekeeper—or rather home-keeper—she who always has all her work "done up." While no real and perfect domestic life can exist without cleanliness and order, these virtues are not the only things necessary. The real home spirit is far more valuable, and the cultivation of home affection at least as necessary as spring cleaning.

DID you read what "May Maple" said about young housekeepers in the RURAL of May 4? Every one must recognize the justice of her remarks. But it seems that a great many girls never learn anything about housework, simply because all their time is taken up in less useful things. The average school-girl of 14 has a dozen or more studies, one-third of them useless as they are usually taught. In addition to this, she is apt to have music, which takes up the time she should more properly spend in healthful exercise. Such prosaic studies as cooking, sweeping, dish-washing, and the like are entirely overlooked in the haste for accomplishments, and it is not strange that these girls find a good many difficulties in the way when they begin to keep house. The first few months of house-keeping are somewhat difficult, even to one who understands it, and the difficulties must be greater still when it is a novice who battles with them. Certainly house-keeping is one of the accomplishments which should not be omitted, no matter whether a girl can play Chopin mazurkas or not. A little time given to this study, before and after school hours, will smooth the after-life wonderfully.

* * *

AS soon as a girl can hold a needle she should learn to mend, and as soon as she can mend a little she should learn to keep her own clothes in order. Never mind if the stockings are a little bit cobbled—the knowledge that her personal darning and patching depend on herself will make a girl very much more careful. Mending is so very important that it cannot be neglected, and the best way to teach it is to give each girl the care of her own belongings. When mother is always ready to replace buttons and sew up rips, much less care is taken than where each girl is herself responsible for such work.

OUTINGS IN NEW ENGLAND.

VI.

MARY WAGER-FISHER.

THE records of the Plymouth Colony have been so well kept that in going up Leyden street, it is not difficult to locate the rude homes of the Mayflower's passengers; and there are pictures still to be seen of some of their houses. Churches have been built on some of the more noted sites, a Congregational church occupying the spot on which the Pilgrims built their first meeting-house. In following Leyden up to the entrance to Burial Hill, and thence to its brow, one comes to the site of the Old Fort, where Miles Standish had his arsenal for fighting the Indians. From that point, 160 feet above the harbor, he could command a full view of the street and of the immediate surroundings. A tablet now marks the spot. The redoubtable Miles had his own habitation at the base of a hill to the north of Plymouth, where also lived John Alden. The hill still goes by the name of the Captain's Hill, and a tall stone tower has been erected on it in his memory. Of course, we read and re-read Longfellow's noble poem of the Standish courtship, amid the scenes he so beautifully pictured, and in fancy saw Priscilla riding from Plymouth on the white bull to the home of John Alden. One day while sauntering about the town we saw a tin-peddler's wagon which bore the notable name of Standish. Anaximander incidentally asked a resident merchant if this Standish was a descendant of Miles, and what was his business?

Yes, he's a direct descendant," was the proud reply, "and he sells tinware and buys *remnants of cloth*." Naturally, we had a quiet laugh over the "remnants," but admired the spirit of the man, who could not bring himself to say that a Standish D. D. ("direct descendant") bought rags and peddled tinware like an ordinary mortal. That the D. D's. throughout New England and elsewhere hold their descent as a patent of nobility, is as it should be. Of no ancestry could one well be prouder than of the 41 signers to the "compact" drawn up in the cabin of the Mayflower. Burial Hill is packed with graves, and no new interments are permitted in this ground unless one has an unfilled lot in which friends are buried. It is a great resort of the people, who go to sit in it as if it were a park. The view from it is most fascinating, overlooking the harbor with its islands and light-houses, and on very clear days the faint line of Cape Cod may be discerned. Here were buried most of those who survived the first winter, and all the early stones and epitaphs are of very curious interest. The oldest stone is to the memory of Mr. Edward Gray who was a wealthy merchant of the colony. The date on this stone is 1681. All the old stones are of slate, often tapering to the top, with death's heads in various styles, as this was before the era of the weeping willow decoration.

Titles in the epitaphs are scrupulously observed, such as Mr., Mrs., Esq., Honorable, Captain, etc. William Bradford, who was the first Governor of the Colony, from 1621 to 1633, lies here, and his grave is marked with a low granite shaft. On another shaft to the memory of his son, is this inscription: "Here lies the body of ye Honorable Major William Bradford who expired Feb. ye 20th, 1703-4, aged 79 years.

He lived long but still was doing good.
And in his country's service lost much blood.
After a life well spent he's now at rest.
His very name and memory is blest.

Mary Cushman was the last survivor of the Mayflower people, and she lived to be about 90, dying in 1699. Some of the old slate head-stones are protected by coats of zinc, leaving only the inscriptions exposed. Mrs. Tabitha Plaskitt's grave is always visited by youngsters who have read in their school histories of her school teaching, spinning as she taught and when the children were naughty she slipped skeins of yarn under their arms and hung them up on pegs. A row of suspended urchins must have been a novel sight. Tabitha wrote her own epitaph which runs thus:

"Adieu, vain world, I've seen enough of thee;
And I am careless what thou say'st of me;
Thy smiles I wish not,
Nor thy frowns I fear,
I am now at rest, my head lies quiet here."

Many an hour we sat on this hill over-looking the town and the harbor, and traced the course of the Mayflower from the line of Cap Cod, the halt over Sunday at Clarke's Island, always with a feeling of pity that circumstances had landed it on what at that time must have been a very inhospitable shore in the depth of winter. Snow never lies long at Plymouth, but with the cold the place had its compensations in the abundant fish and springs of excellent water, from which people still drink. At one of the springs, by the side of a street, is this legend: "Come, freely drink and quench your thirst. Here drank the Pilgrim fathers first," and it is doubtful if any visitor reads the invitation without accepting it, and the water is exceedingly good. The woods back of Plymouth are charming, and there is no end to the small lakes in the forests. I have heard it said that there are in Plymouth county 365 lakes. The laddie who was learning to swim, found them very pleasant for his purpose. The bathing was fine on the ocean side of the harbor bar, and as a little steamer made frequent trips across the harbor, it was always convenient to reach the sandy beach for a bath. The boating in the harbor at high tide was delightful, but when we went outside we took the precaution to take a skipper. One morning we sailed to Clarke's Island, and visited Pulpit Rock, an immense granite boulder under the sunny side of which the Pilgrims held their first religious service in New England, and the rock bears the inscription: "December 20, 1620. On the Sabbath day we rested." There are a few houses on the island, one of which is the summer residence of Professor Godwin, of Harvard.

There were always a great many boats out on fishing and lobstering expeditions, and the hotel table was well served with fresh fish, while chowders were a daily dish. There were beautiful walks in every direction landward, one of which led to Forefathers' Monument, which is the highest and finest granite monument in the world. The hight of the base is 45 feet; of the statue, 36 feet—a figure of Faith. All the accompanying statues had not then been placed around the center one, but so far as the work had progressed it was of the finest character, and very beautiful. The inscription is this: "National Monument to the Forefathers, erected by a grateful people in remembrance of their labors, sacrifices and sufferings for the cause of civil and religious liberty," and the names of all those who came in the Mayflower are engraved on it. There are to be four scenes in the lives of the Pilgrims represented—the Departure from Delft-Haven; the signing of the social compact; the landing at Plymouth, and the first treaty with the Indians. There are nine acres about the monument and they are to be laid out in the finest style. Different States and private individuals have so far contributed the money for different parts of this superb memorial.

Pilgrim Hall is naturally a place of great interest, as with the relics there one can, in a degree, rehabilitate the colonists. It was built in 1824, since which time the building has been made fire-proof. The walls are hung with paintings, including a number of portraits, while the relics in glass cases are surprising in number. Here is Miles Standish's famous Damascus sword, the Arabic inscriptions on it having been a standing puzzle, until they were deciphered, some eight years ago, by Prof. James Rosedale, of Jerusalem. John Alden's Bible is here, and a piece

of embroidery wrought by Lorea Standish. The oldest State paper in existence in the United States is also here—the first patent granted to the Plymouth colonists by the New England Company; also the original manuscript of Mrs. Heman's well-known ode,

"The breaking waves dashed high
On a stern and rock-bound coast, etc.,"—

and a copy of Eliot's Indian Bible of which but three or four copies are believed to be extant. Some of the furniture was loaned to the Centennial Exhibition in Philadelphia, of which one piece was Peregrine White's cradle—he having been born in the Mayflower, and named Peregrine from the peregrinations of the Pilgrims.

FEMALE FINANCIERING.

MRS. S. H. ROWELL.

"I WISH you would let me have the privilege of managing the family finances this year, Mr. Clark. I hate this annoyance of bills as much as you can; and I really think we could live cheaper, and better too, if we paid cash when we buy things," said Mrs. Clark, as her husband sat with a clouded brow, opening the monthly due bills, that were handed in the previous evening.

"Why, Carrie, what could you do? Women don't understand how to use money; you would make a perfect muddle of it!" he replied, as he took out his pocket-book, and laid it on the table.

"I might not. Mrs. Shelly does not. She has $25 each week to support the table and clothe herself, and they are never bothered with due bills. Her husband buys the fuel, and pays the rent, and she manages the rest."

"Twenty-five dollars! why, it would not half defray our expenses! Why, Carrie, it costs us over $300 a month, aside from rent and coal. What's the use of talking?" and he gathered up the bills and put them in his coat pocket, and took his hat.

"Over $300 a month! Impossible!" she exclaimed.

"Look over the bills yourself! It costs like thunder to keep house!" and he threw the bills on the table beside her plate, and went away.

"Goodness! He must be mistaken! But I will look them over. I know I am not extravagant in dress; and we live no better than I used to at home; but mother always bought things herself, and we never used to buy on credit either. I wish my husband would let me try for awhile. It is horrid to have to pay such heavy bills."

Mrs. Clark was a young house-keeper. For 18 months after her marriage, they had boarded in a fashionable hotel, but she did not enjoy it, and finally coaxed her husband to go to keeping house. He rented a fine house, in a good location, and her father gave her money to furnish it; but Mr. Clark was not content with simply nice furnishings, but must have the most elegant and latest style of everything. Of course, it took money, and then, his wife must not work but have servants to wait upon her and do the work. He was in a lucrative business, and never talked over his affairs with his wife; but she had noticed for some months that he seemed worried and troubled, and thought perhaps they were living beyond their means. He was really cross when she laid the bundle of house bills before him that morning, and as soon as the breakfast things were cleared away, she took a sheet of paper and pencil, and commenced looking over the amount. A frown gathered on her smooth brow and settled into a real scowl as she proceeded with her task.

"We have not had six turkeys within a month! Here are 20 roasts of beef too! and oysters, and fish, and dear knows what besides! And fifty pounds of sugar a week! Goodness! I should think it was time to look over the matter. Now for the milliner's bill. My winter hat $25! And she told me it was only $18! A dozen yards of lace and a box of gloves! $15! and I had neither. I will just see the Madam myself this day! I think I will go down and look over the supplies in the kitchen first! It is impossible that we have used such an amount of groceries in a month. There are only six of us in the family, and here are bills charged enough to feed a regiment."

Mrs. Clark was an energetic little woman, and when she determined to do a thing, she accomplished it, and it did not take her long to decide that her corps of servants were not very trustworthy, or that her cook had taken a large share of the supplies as her perquisites, and had almost supported her sister's family from the Clark larder. When her husband came to dinner, he had a friend with him, so she waited till evening before she laid the matter before him. He was just furious! She had never seen him in such a temper before. "I wish you would let me have the cash to settle the Madam's bill myself; I am not going to pay her charges," she said.

"You shall have it; and if you wish to try your hand in catering a month or two, I am willing you should try it. Your father came into the office to-day, and I had a talk with him, and he says a woman can manage household affairs better than a man. The times are hard, and business is dull, and we really have been living beyond our means. I do not blame you, of course, but I would get rid of that cook as soon as possible."

"You may be sure I will, and I really think that if I have the money to pay for things, I can get them cheaper and better."

"How will Mrs. Clark like going to market herself?" he asked.

"Oh, I shall take Will along to fetch the small things, and the rest will be delivered, of course; never fear, I am all right."

And so she was, and at the end of the next month, she had not only kept her table well provided with every luxury, as heretofore, but had a new spring suit for herself with a hat, and $50 left of the $200 that her husband gave her at the commencement of her experiment. She dismissed two of the servants, and saw to the arrangement of her work herself, and was happier and healthier for the labor. Mr. Clark was delighted with the change, and never again thought that a woman could not manage money matters if she had the opportunity to do it, and the means provided for her.

"Your father was right when he said women were better managers of household matters than men. If you want more cash for pin-money, you have only to ask for it, for I know you will not waste it in extravagance, and I do not believe it will be an easy matter for merchants or trades-people to cheat or impose upon you."

WORRY AND WORK.

AN INVALID.

SPRING and house-cleaning time with all their trials and perplexities have come again. Oh! the worry and confusion, the ceaseless round of woman's work! But, sisters, do not be worried if your house-cleaning is not all finished the first week it is begun, or if some of your thrifty and ambitious neighbors get theirs finished (with the addition of bad colds,) before yours is barely begun. Above all, take care of your health. Ah! how well I remember the last work of any account that I did!—the work that I foolishly thought must be done *just then*, another and another task that I thought must be performed that week, until weary limbs and aching back refused to do their mission longer. Then followed long months of pain and uselessness, and, for aught I know, I may never again be able to take up life's work. How often, on my couch, I have wished that I might again live over those days wherein I sinned against my being and my Creator, before disease claimed me for its prey.

You who have health and strength left you, take care of these blessings while you may. No work is positively necessary when you are tired, for were you sick you could not do it. Over-work and carelessness are the causes of half the sickness in the world. Remember how those common tasks of life would sink into insignificance if death faced you.

How tiresome woman's work is, day after day doing the same things over and over again! How often we long to throw aside our aprons and take up books or the pen. But

"Let us be content to work
To do the thing we can, and not presume
To fret because 'tis little."

Let us do our best in whatever duty calls us to do. Let us stop and look about us on the green fields, spring flowers and blooming fruit-trees, and to the blue sky above us, and thank God for the beautiful place He has given us to work in. Cultivate the habit of looking at the bright side of everything, and in counting our mercies forget about the dark hours. We must endure trials, for no life was ever free from them, but remember that

"From hours of grief and saddened face,
True wealth of heart we borrow;
And heavenly wisdom oftenest comes
Clad in the guise of sorrow."

GOLDEN GRAINS.

SIR WILFRID LAWSON says that there is an old saying of which he is fond. Some great man has said: "I never knew any one to get lost upon a straight road." It is only when you try to make short-cuts—when you try to dodge a principle—that you get into scrapes.....

OLIVER WENDELL HOLMES says that many years ago, in walking among the graves at Mt. Auburn, he came upon a plain, upright white marble slab, which bore an epitaph of only four words, but to his mind they meant more than any of the labored inscriptions on the surrounding monuments: "She was so pleasant." This was all, and it was enough. That one note revealed the music of a life of which he knew and asked nothing more.....

THE CHRISTIAN REGISTER says that the kind of a girl it likes to honor is reported to be spending her vacation in giving her mother a "rest." When asked what she was doing, she said she was enjoying herself very much doing the house-work. "Your mother is away on a vacation, then?" "Oh, no, she is at home; but I'm giving her a chance to rest in the morning, and to dress up and sit out on the piazza when she feels like it. I think it will do her good to have a little change."....

YOU go and gossip with your housemaid or your stable boy, says Ruskin, when you may talk with kings and queens, while this eternal court is open to you, with its society wide as the world, multitudinous as its days, the chosen, the mighty of every place and time? Into that you may enter always; in that you may take fellowship and rank according to your wish; from that, once entered into it, you can never be outcast but by your own fault: by your aristocracy of companionship there, your inherent aristocracy will be assuredly tested, and the motives with which you strive to take high place in the society of the living, measured, as to all the truth and sincerity that are in them, by the place you desire to take in this company of the dead ...

PEABODY says that a genuine conscience is a growing conscience—one that is perpetually becoming more prompt, more keen, more tender. It is in this, mainly, that the growth of character consists. Where there is no increase of moral excellence there is always danger of decrease.....

THE CHRISTIAN UNION reminds its readers to the effect that nothing is more expensive than penuriousness, nothing more anxious than carelessness, and every duty which is bidden to wait returns with seven fresh duties at its back.....

WE attain our highest possibilities when we see clearly the limitations, the obligations, the conditions, that control them. We cannot cast them aside by an effort of will as powerless; they clog and fetter every movement, they are the ghosts that will not be downed. Their warning fingers change to a menace which we cease to see only when we have lost sensitiveness and sensibility. We grow into a likeness of the Creator when we accept humanity and seek not to be gods. We are great, not by what we accomplish, but by what we overcome.....

THE power that determines our career lies within, not without; clearness of spiritual vision decides our plan of life.....

EMERSON advised every man to take the place and attitude that belonged to him, the world must be just. It leaves every man with profound unconcern, to set his own rate. Hero or driveller, it meddles not in the matter. It will certainly accept your own measure of your doing and being.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

THE man or woman who is the happiest is the most economical.

THE successful housekeeper is always a little ahead of time.

"I HAVEN'T the time," is the ne'er-do-well's excuse for culpable negligence.

"It is too much trouble." A short but expressive sentence and one that accounts for many a man and woman's life failure.

LIES.

WHAT is a lie? This question has been running through my mind all the afternoon. Some people may say that wavering one iota from the absolute truth, the uttering of one word not entirely necessary in the statement of a fact is a lie. Well, so it is. But many people lie without doing even so much as that. A gesture, a shrug of the shoulders, the uttering of a few words from which a double meaning may be taken, often do more harm than a deliberate falsehood. I have heard such expressions as "Oh! she's no better than she ought to be," used when a lady's name was mentioned, or "She knows more than her prayers."

Of course, they might be true, for no one is any better than he or she ought to be, and if one didn't know any more than one's prayers, one wouldn't know much. But such speeches as the above, accompanied with a gesture, or the raising of the eyebrows, may do far more harm than if a false statement were used. Such a thing as this, to my mind, is a lie. We have no right to insinuate. If we really *know* anything wrong about a person, I suppose we have a right to tell of it, but even then it would be more Christian-like to refrain from so doing unless we are, or feel ourselves in duty bound to do so. Yet many who call themselves Christians fall into this habit, without perhaps meaning to injure another—but one never knows where a thing is to end. It may be

"Only a trifle as light on the wing,
As the veriest insect devoid of its sting,"

but it may be a mountain before it ends.

Something I heard while at lunch to-day set me thinking about all this. The table at which I sat was arranged for four.

A sweet-faced old lady sat next to me and two girls opposite. While the old lady was reaching for the butter her sleeve caught her cup and upset the coffee all over the table. I pitied the poor thing, for she looked half frightened to death. We sopped up the coffee with our napkins and told her to "never mind," but she seemed so mortified and humiliated that she could scarcely eat. Just then one of the girls opposite said:

"I wouldn't mind if I were you. Such a thing as that happens every day."

"But I never did such a thing in my life before," said the old lady.

"It isn't half so bad as what I did the other day," said the girl with a smile. "I went into a restaurant up town—a regular swell place too—and just as I was about to begin my dinner I upset my tumbler of water and it smashed all to pieces on the floor. I thought I'd die! Then to crown it all, in my excitement I knocked my elbow against my cup of tea and down it went on the other side." We all laughed at this, for she told it with such an expression! Then she said "To make it worse I was with a gentleman too. Wasn't it awful? Now if it had been here I wouln't have cared a straw." The old lady was quite reassured and finished her dinner with ease. When she went out the other girl turned to the one who had been talking and said:

"I suppose that was another one of your fairy tales; wasn't it, Joe?"

"Well, not exactly," replied Joe. "Of course, it didn't happen to me, but I saw just what I described one day last week. And then I pitied the poor old lady. The tears were ready to run down her cheeks, and I know I would have felt dreadfully bad if I had been in her place."

"Well you're the neatest liar I ever saw," responded her friend.

"That wasn't a lie, at all," said Joe. "Did it harm any one? A lie is a thing said with an evil intent; a thing that will injure another. Now what I have just said to that woman wouldn't hurt any one!"

When I left they were still arguing about what was and what was not a lie. I was inclined to believe that "Joe" was right. What she had said had really happened, though not to her. But by putting it on herself she made the unfortunate old lady feel more at ease, for she, no doubt, thought that if that dainty, pretty little thing could be so dreadfully clumsy, a less degree of clumsiness wasn't quite unpardonable in her.

Of course, I am not advising any one to "go and do likewise;" but, then, it doesn't seem to me that that girl lied. If you could have seen the sweet, affectionate manner with which she talked to the old lady, I'm sure you, too, would have felt inclined to be lenient with her. I hold that a lie is, as she said, something said or implied, with an evil intent—something, be it act or implication, meant to deceive. Of all vile habits that is the worst. We can lock our treasures up from a thief, but who is safe from a liar?

What Herbert Spencer says in regard to cursing seems very apropos to lying. He says: "If every curse should stick a visible blister on the tongue, as it does invisible ones on the soul, how many men's tongues would be too big for their mouths, and their mouths as an open sepulchre full of dead men's bones."

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria.

Change the word "curse" and in its place substitute "lie," and,as I said, I think it quite apropos, for the liar and blasphemer go hand in hand. I would as soon trust one as the other. DORA HARVEY VROOMAN.

DISH-WASHING.

TO make the washing of dishes a simple and pleasurable process, make the dishes ready for washing by using a flexible knife and plenty of soft paper. Empty tea and coffee pots, rinse thoroughly with cold water, wash in hot suds, rinse with boiling water, wipe the outsides and turn upside down on a folded cloth on the back part of the stove. Wash silverware next, rinse in hot water and wipe immediately. As each piece of earthenware, tin and iron-ware is washed, immerse it in hot water, turning earthenware on a cloth to drain before polishing, and putting tin and iron-ware on the stove or in the oven to dry. Wash glassware in lukewarm suds, rinse in either very warm or cold water and turn on a dry cloth before polishing with soft, dry towels. A dish-mop saves the hands and is wonderfully effective in washing pitchers, fruit cans, etc. To make a good mop, crochet a chain (twine or carpet-warp) about 12 inches in length, go back over it with any kind of a stitch and then fill the lower edge with a thick fringe, two inches long when finished. For the handle, saw off 12 inches of the top of a broomstick, and to the lower edge of this fasten the mop by tacking one end, and closely and firmly winding upwards, and secure with a second tack.

Having completed one dish-mop, make two more, one for lamp-chimneys and one for a friend. MEDORA CORBETT.

Domestic Economy has been doing its own dish-washing for the past few weeks,and having bought a mop or swab (cost eight cents) can testify as to its practical advantages and superiority over the ordinary article. In the R. N.-Y. of June 13, 1885, page 408, Mary Wager-Fisher describes one she made while staying at Seattle, Oregon. As it differs a little from the one Mrs. Corbett tells us of,we will republish Mrs. Fisher's directions. She says: "I have the frugal habit of saving strings, such as grocers tie about packages, and as our supplies came to hand and were disposed of, there was quite an accumulation of cotton wrapping strings or cords. The whittler of the family prepared a handle for the swab—a round stick the size of a broom handle, a foot long, with a hole in one end through which a string is passed to hang it up; around the other end a groove is cut. I wound the strings around my four fingers held flat, slipped a stout cord through the hole left when the fingers are withdrawn, and tied the loop firmly around in the groove; then cut the bottom of the loop of strings, which results in a heavy fringe falling all around the bottom of the handle. New strings can at any time be added to replenish the swab, which needs to be large and full. I have been thus specific about the swab, as there may be some unfortunate dish-washer left in the world who still clings to a dish-cloth, and if so, she may be hereby induced to make for herself a swab, and wonder evermore that she lived so long without one, for it saves the hands from being burnt with hot water, the dishes are cleaned more thorougly and quickly, and the swab never degenerates into a dish-rag. Wring dry when through with it,shake out and hang up to dry."

Surely, thought we, this noon while using the mop, there is no teacher like experience, for until our recent trial, we confess to having pinned our faith to the ordinary article for cleaning dishes and to looking upon the mop as a delusion and a consumer of much time. Our conversion is complete and, with Mrs. Fisher, we advise all dish-washers to make or buy a dish-mop. Another capital help is a stiff whisk, such as is used for cleaning sinks, for washing pans, kettles, etc. After using cooking utensils, place them on the back of the range with water in them, adding a small lump of washing soda. When the water is hot and the adhering substance loosened, scrub vigorously with the whisk, inside and out, rinse in hot water and dry on the back of the range or in the oven.

With these helps, plenty of hot water and clean towels, dish-washing is robbed of half its terror, and were it not for its repetition thrice daily, we could almost bring ourselves to like it.

SMOKING; ITS EFFECTS.

TWO articles by J. H. G. given recently in the RURAL, on smoking, were so good that I cannot help expressing my appreciation of them. He insists that rules should be made against smoking in the presence of non-smokers, whether in public or private, and says that "the health of many delicate women suffers through having fathers or husbands or brothers, smoke in their presence." He might go farther, since the health of many women and children suffers from daily companionship with smokers, whether the smoking is done in their presence or not. An inveterate smoker's clothes, his breath, and in fact every fiber of his being are so permeated with the poison as to make him a good conductor of it at any time.

And if one studies heredity, he will find the offspring of habitual smokers much more likely to develop nervous disorders of various sorts than those of non-smokers; and, more, he will find that habitual smokers' descendants more readily form an appetite for stimulants, too, though this last is not *wholly* chargeable to tobacco, since the brandy, etc., so largely used in the manufacture of cigars help somewhat.

And now I can't help this bit of defense of the smoker: of course, he must be ignorant of the effects of narcotics on himself and his posterity, and brutally selfish as well, when he smokes in the presence of non-smokers; but who let him grow up ignorant, and encouraged him in selfishness? How much time did his mother spend when he was yet under school age, and his teacher, when larger grown, in teaching him the damage done the human body by using narcotics? True, we have non-scientific temperance instruction given in some of our schools, but that was begun too late to reach the men of to-day. And how many young women of our smoker's acquaintance gave him to understand that smokers and smoking were obnoxious to them? Didn't the majority say, with the sweetest of smiles, when asked if smoking was objectionable to them, "Oh, no, not at all?"

The average man is—as one at my elbow admits—"a bad lot, I s'pose," but I really wonder, sometimes, that he is not worse, when I see to what lengths he is allowed to go in all directions, principally, it seems,because he is such a scarce article—because he's the only son, the only brother, "the only young man in the town." All the more reason why he should, and could be a prime article.

"The hand that rocks the cradle, rules the world," whether the hand be that of a mother a grandmother, a sister, or a maiden aunt.

"Give me," said a famous teacher, "the first dozen years of life, and I'll answer for the rest.

"A word to the wise is sufficient."

"POST SCRIPTUM."

VALUABLE.

ARTICHOKE SOUP.

TO those of the readers of the RURAL who have artichokes, and have never tested them for soup, I recommend them as among the most appetizing vegetables of early spring. At any time after frost is out of the ground, and before the tops are much grown they can be used. Pare the tubers, slice them thin, and boil in a sufficient quantity of water till tender. Season with salt, pepper and butter, adding milk the same as for oysters, and the difference between the animal and vegetable products can hardly be distinguished One household at least, in which this delicious soup is eaten, declares its preference for the latter.

HARD SOAP.

AMONG the various formulas for hard soap, which have appeared from time to time on the pages of the RURAL I do not recollect the mention of the use of Lewis's 98-per-cent. lye. For years I used the lime and sal-soda process, till one of my neighbors gave me information concerning the lye, and I have never since used anything else. The process is so simple and sure, and involves so little labor, and the result is always so satisfactory, that no one who has ever used it, will, I think, resort to any of the old methods. This lye is manufactured by the Pennsylvania Salt Company, and each box contains three quarters of a pound, costing 10 to 15 cents, and is warranted to make 10 pounds of pure soap in 20 minutes without boiling; and it will do it every time if the plain directions which accompany each box, are followed. The soap is also in my opinion, very much superior in quality to that made by the sal-soda and lime process. To the last soap that was made, I added several spoonfuls of powered borax, which I find makes a great improvement in its sudsing qualities, and the soap is voted equal if not superior for all household uses, to any which can be found in market, while the cost and trouble of making are comparatively nothing.

REMEDY FOR CABBAGE WORMS.

A FRIEND from the central part of the State told me, last summer, that the farmers and gardeners in her neighborhood were in the habit of setting pans of sour milk in the cabbage patch, during the summer, and had no trouble with cabbage worms. The moths are attracted by the milk and are drowned in great numbers. I shall certainly try it the coming summer.

Mr. T. B. Terry is deserving of the thanks of every woman in the land for his generous article in a late RURAL, with regard to women's rights as partners with their husbands, which is arousing so much comment and commendation. To him are due the thanks not only of those women, who, when money is needed for necessary expenses, have to undergo the humiliation of begging for a small portion of what by right belongs to them, but also of those who share the common purse equally with their husbands, for his noble championship of their oppressed sisters.

True marriage is an equal partnership in which both parties share not only the labors and the burdens, but also the joys and the rewards. There are as many men as women, especially in country life who are likely to spend the hard earnings of the firm, extravagantly and unwisely. The wife and mother works as hard and usually more hours at her duties, and equitably if not legally a fair proportion of the profits are hers, and that too without having to beg. The Mosaic account of Creation is that "God created man in his own image; *male* and *female* created He them, and gave *them* dominion." Every family needs two heads as much as a person needs two ears, two eyes, two hands, two feet, each working in harmony with the other, and where either head is in subjection to the other, or from any physical, mental or moral inability unable to carry its just share of the burdens and cares of life, or where either is forbidden to enjoy equal rewards, there is inharmonious action and lack of completeness. MRS. W. C. G.

Most Reliable

For all affections requiring a purgative,

Ayer's Pills

are the general favorite as a family medicine. Sick Headache, Indigestion, a Sluggish Liver, and Constipation are among the complaints for which these pills are peculiarly effective.

"I regard Ayer's Pills as one of the most reliable general remedies of the times. They have been in use in my family for various affections requiring a purgative medicine, and have given unvarying satisfaction. We have found them an excellent remedy for colds and light fevers."—W. R. Woodson, Fort Worth, Texas.

Ayer's Pills,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass
Sold by all Druggists and Dealers in Medicine.

Baby Portraits.

A Portfolio of beautiful baby pictures from life, printed on fine plate paper by patent photo process, sent free to Mother of any Baby born within a year. Every Mother wants these pictures; send at once. Give Baby's name and age.
WELLS, RICHARDSON & CO.,
BURLINGTON, VT.

ICE CREAM AT HOME!

Made cheaply and quickly by using a Triple Motion
WHITE MOUNTAIN FREEZER.

Will freeze in half the time of any other Freezer and produce cream of the finest quality. Inquire for the "White Mountain" of your local dealer in house-furnishing goods.

"Frozen Dainties,"

A book of Choice Receipts for Ice Cream, Sherbet, Water Ices,etc., packed with each Freezer this season, or will be mailed upon receipt of ten cents in stamps.
White Mountain Freezer Co., 134 Hollis St., Nashua, N. H.

BABY COACHES

Over 100 different designs.
Our Patent Automatic Brake FREE

We make the largest line of Adjustable, Reclining, Invalid Wheel, Physician's, Rattan and Office CHAIRS. INVALID GOODS a specialty. BICYCLES, VELOCIPEDES etc. *All at factory prices.* Special FREE delivery. Send stamp for Catalogue, and name what goods you wish it for.
LUBURG MFG. CO. 145 N. 8th St., Phila., Pa.

IN Guy's (London), Hospital Reports, Vol. 1, page 396, is found the statement: "Simple hypertrophy (enlargement), of the heart, especially of the left ventricle, is found without valvular incompetency. In this numerous class the cardiac is secondary (a symptom), to the renal affection." This explains why Warner's Safe Cure is effectual in cases of heart disease. It removes from the blood the kidney acid which causes the heart disease.

CALF Weaners and Sucking Cow Muzzles. The best in the world. Send for Circular. H. C. RICE, Farmington, Conn.

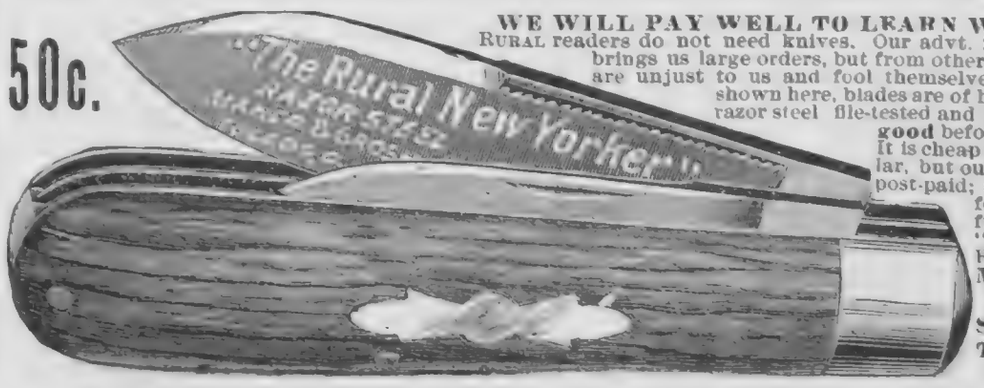
Who (if your druggist does not keep them) will mail Beecham's Pills on receipt of price—*but inquire first.* (Please mention this paper.)

50c.



WE WILL PAY WELL TO LEARN WHY IT IS
RURAL readers do not need knives. Our advt. in some papers brings us large orders, but from others few. Readers are unjust to us and fool themselves. Take knife shown here, blades are of highest quality razor steel file-tested and **known to be good** before sending out. It is cheap for a silver dollar, but our price is **50c.** post-paid; 5 for $2. Send for our 64-page free list, also, "How to Use a Razor."
MAHER & GROSH, 80 S Street, TOLEDO, OHIO

News of the Week.

HOME NEWS.

SATURDAY, May 18, 1889.

JAMES KELLY, produce dealer, Lexington, Ky., has just escaped the clutches of a "green goods swindler" in this city. Wednesday morning he was found dead at a hotel in New Brunswick, N. J, with the g. g.'s circulars in his pocket and a letter making an appointment with the crook. Kelly had blown out the gas and been suffocated. People who blow out the gas instead of turning it off, are ready-made dupes for swindlers .....Deaths by lightning have been unprecedentedly numerous for the season of year—and the electric lighting and telephone wires in towns and cities add considerably to the number of casualties from electricity. .....Bringing suits for "breach of promise" is becoming quite a popular and profitable industry for women from sweet 16 to sour 70—the age of the latest aspirant for damages.....Freight rates on dressed beef from Chicago to New York have just been reduced from 50 to 45 cent per 100 pounds by the trunk lines..... After all, the Missouri Senate has finally defeated the anti-dressed meat bill, though the House has passed it by a large majority and a telegram to New York a fortnight ago, said the Senate had done likewise. A similar bill was shelved by the New York State legislature last Tuesday. The legislature adjourned at noon on Wednesday after a session which appears to have afforded little satisfaction to the public..... The new license laws in Philadelphia have reduced the number of retail dealers in intoxicants from 3,214 to 1,203, and the number of wholesalers from 640 to 500. The lawyers who appeared on behalf of the rum-sellers netted about $750,000 in fees, and "stood to win" much more had they gained more cases. The successful representatives of ordinary dealers averaged $250; while those who represented 40 of the most profitable and notorious places averaged $2,500 each. About 300 of the wholesalers paid $500 apiece, 200 $100 each, and the rest $50 per man. The profits of the business are so enormous, that it pays to give big fees for even a chance to continue it .....Mind-reader Washington Irving Bishop, who created such a sensation in this, his native country, and in Europe by his wonderful mental performances, died here the other day from mental strain incurred in performing a new feat which brought on a cataleptic fit. The doctors in holding a post-mortem examination cut him up a few hours after his death without permission from his relatives, and his mother and wife insist that he was merely in a trance and was killed by the doctors..... It turns out that WILLIAMSON, the Philadelphia philanthropist, who gave millions for founding a great school for the gratuitous instruction of boys, during life paid only $200 a year taxes to the State on $67,500 invested in taxable securities whereas he had $3,750,000 so invested on which he ought to have paid $11,200. His executors will have to pay the full amount in future.....A combination of glass fruit-jar and fruit-jar cap makers at Pittsburg, Pa. where nearly all those goods are made, has just raised the prices and threatens another big lift.....The emigration out of Oklahoma continues. Entries on hardly a fifth of the land have been filed yet; but it is expected that many will return soon and complete their entries..... ... The rush to the Sioux Reservation on the Upper Missiouri is increasing. It is thought that in six weeks it will equal the recent Oklahoma boom. A large proportion of the 11,000,000 acres to be soon thrown open to settlement there, however, is utterly unfit for cultivation, and much of it is not superfine for grazing.... ..... A new smoke-burner for locomotives has just been satisfactorily tried on the Wisconsin Central Railroad, which does entirely away with the smoke nuisance; the locomotives furnished with it need only half the usual amount of coals. It's a boon therefore alike to the railroads and the public! ... .Two New Yorkers have just started on a ride across the continent to San Francisco on a couple of bean-fed nags.....The peach growers of Delaware have to face the prospect not only of a crop so unusually large as to render it difficult to market it so as to realize a profit, but also the threat made by the Peach-Growers' Association of Northern New Jersey, that its members are about to set out 500,000 young trees, besides encouraging others to do likewise. Small wonder that the Delaware peach-growers are rather disconsolate!..... Thursday morning a fire destroyed 700 houses in St. Sauveur, a suburb of Montreal. As the houses are nearly all of wood the flames spread rapidly, making 4,000 to 5,000 people, chiefly belonging to the laboring classes, homeless. Loss $600,000. While trying to blow up some of the buildings to stop the progress of the flames a major and sergeant of the garrison were killed by a premature explosion of powder.....Not a single State legislature has adjourned this year without a hearty "Thank God" from most people. Complaints of jobbery, bribery and all sorts of corruption have been unusually numerous and loud..... Allen Thorndike Rice, aged 36, editor and owner of the North American Review, who had been appointed Minister to Russia a little over a month ago, was suddenly attacked by tonsilitis—a throat disease—just as he was about to start for Europe last Saturday. The doctors thought little of the matter; but he died suddenly on Thursday morning from an aggravation of the disease causing suffocation.

FOREIGN NEWS.

SATURDAY, May 18, 1889.

LAST Monday week the great French International Exposition was formally opened by President Carnot and other celebrities. It was to a great extent incomplete; but everything will be ready by the end of the month. As it was avowedly started to commemorate the great French Revolution which proved so disastrous in its consequences to the monarchies of Europe, it could not expect much aid or sympathy from any of their present representatives. Indeed, contrary to the custom at all other European International Expositions, no monarchical country in Europe is officially represented at this, nor has any assistance been given from the public Treasury of any to intending exhibitors. On the contrary, in several cases, notably in Germany, a good deal of official discouragement has been extended to such enterprises. The chance for advertising their goods, has, however, induced manufacturers and others to make very full exhibits, and the show will probably, after all, be finer than any of its predecessors in France or any other country. The buildings cover a larger area of ground and are more artistically and conveniently constructed, while the number of entries is considerably larger than at any previous display of the kind. This is the only great nation which has made an appropriation to aid exhibitors, and the American display promises to be exceptionally fine. A vast concourse of visitors is already under way from all parts of the world, the United States contributing a mighty contingent. The Effel Tower, a thin iron lattice-work structure 1,000 feet high, is the most unique and probably the most attractive feature of the Exposition.....

A Happy Medium.

IN our efforts to urge conviction our greatest concern, often, is to captivate inclination. When we have done, our adversary admits that he has been agreeably entertained, but he is of much the same opinion as he was before. Then we attempt the direct. We establish an irresistible sequence; an adversary follows; he is convinced but offended.

Our pith pellets of argument have only amused him; but directness and sincerity are trenchant and his veneer of composure is pierced. Now what must we do? We want to convince without offence. Perhaps there is a happy medium. Let us see:

DARLINGTON, S. C., Feb. 7, 1886.
"I intended writing to you three months ago to let you know how wonderfully your Compound Oxygen helped me. I recommend it whenever an opportunity occurs."
SERENA L. DARGAN.

ALMONT, N. Y., May 20. 1887.
"The Compound Oxygen is a marvelous remedy." I am, most sincerely,
MRS. J. C. GOFF.

CRAFTON, WISE CO., TEXAS, May 7. 1888.
"I want to tell you how your Texas Asthmatic is getting along. I am just as well at this date as I was when I gave you my testimonial in ('86)." MRS. MARY HARGROVE.

MIDDLETOWN, N. Y., JANUARY 25, 1888.
"I have used the Compound Oxygen now for about three years, and consider it the most efficient remedy ever offered to the smfferer."
REV. WM. MCGLATHERY.

We publish a brochure of 200 pages, regarding the effects of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 120 Sutter Street, San Francisco, Cal.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, May 18, 1889.

OUR CORRESPONDENT, Hiram P. Hopkins was invited by the United States Dairy Commissioner for his district to make a sample of butter to represent the dairy interests of Erie County, N. Y. at the Paris Exposition..... Assistant Secretary of Agriculture Willits has received a letter from Ireland setting forth the profit of flax culture to America. If factories for the manufacture of flax products could be had in this country the crop would pay well.....Rats have for a long time infested the quarters occupied by live animals at the Smithsonian Institution at Washington. It was impossible to catch them until the discovery was made that they are extravagantly fond of sunflower seeds. Traps baited at night with these seeds held, the next morning, 10 to 15 rats each..... Samuel Budgett & Son, the English cheese merchants state that there has been a gradual decline in prices of cheese. It seems probable that prices will fall still lower. English commission men are carrying smaller stocks than usual and it is probable that late in the season prices in England will jump up because of an under supply. Its expected that New Zealand will ship considerable cheese to England this year..... The tent caterpillar is increasing at an alarming rate in Central New York, and many farmers are making no effort to check its ravages.....From the Crop Report of the Missouri State Board of Agriculture, we learn that crop prospects throughout the State are more favorable than for many years, if indeed, they have ever been so good. The season is 10 days to two weeks earlier than last year. The condition of winter wheat is placed at 98. The prospects for other crops are very favorable. Fruits, with the exception of apples, promise well.....The Lake and rail freight rate on corn from Chicago to New York has been reduced to 7⅛ cents per bushel, and the Lake and Canal rate to 6¼ cents..... The 14th annual meeting of the American Association of Nurserymen will be held at Chicago, June 5 and 6. Papers or addresses are expected from Hon. Norman J. Colman, J. H. Hale, G. E. Meissner, P.J. Berckmans, W. C. Barry, P. Barry, William Storrs, T. S. Hubbard, Peter Henderson, J. T. Lovett, Mr. Hobbs, Geo. W. Campbell, Anthony Lamb, H. S. Anderson and many others. George A. Sweet is president and Charles A. Green secretary.....The Moorestown Agricultural and Industrial Society will hold their 14th annual exhibition on their grounds at Stanwick Station near Moorestown, N. J. June 6, 7, and 8. The premium list includes field trials of all kinds of agricultural implements, plowing matches, shepherd dogs herding stock, etc. An extensive strawberry exhibit will be made.....The Illinois State Grange, Patrons of Husbandry, offered a reward of $10,000 for a patentable contrivance which may be attached to reaping machines, and which will bind wheat and oats with straw instead of with twine..... The Cattle Inspection bill was defeated in the Michigan Senate recently.....Connecticut claims one-third of all the creameries in New England.....Mr. Aspinwal of Three Rivers, Michigan, the inventor of the Aspinwal potato planter, has invented and put into practical operation, wooden combs for bee-hives.....A Michigan firm of Short-horn breeders claim that one of their cows recently gave birth to three bull calves which are all doing well..... The first 13 volumes of the American Short-horn Herd Book are being revised .....The Kentucky Station is making experiments designed to determine what fertilizers are most needed in the culture of hemp. Most farmers think that naturally rich land is needed for hemp. The station desires to know if poor land to which fertilizers are added will answer.... The committee appointed at the last annual meeting of the Ayrshire Breeders' Association recommend the adoption of a set of rules to govern cow tests at all fairs, dairy shows and experiment stations, that the awards may be given to the breed or single animals which show their superiority as profitable dairy cows. These rules in brief are that all cows entered for trial shall be securely locked up, shall be fed, watered, milked, etc., uniformly, under the charge of a superintendent, the cow to be charged with all food consumed. A statement of the cow's previous condition and treatment must be made under oath. The cows must be milked regularly, and samples of each milking must be analyzed. The milk must be handled uniformily, the butter analyzed, and only the dry fat be calculated. The cow or herd giving the greatest quantity of marketable products at least cost to be awarded the prizes..... The experiment stations are all issuing bulletins devoted to fertilizers and fertilizing materials. The Tennessee station is the last to issue such a pamphlet.....A load of rye was received this week to go forward to Germany. Two loads of white corn were bought for Venice, which, with two loads last week form the first shipments to that country in many years.....

Miscellaneous Advertising.

The Kodak.

A WARNING.

UNAUTHORIZED parties are advertising a Camera which they claim is similar to the Kodak, loaded with our film. (We are the only manufacturers of continuous films in the world) We warn the public that the said Camera is entirely unsuitable for using our films and we decline to be responsible for any failures resulting from its use.

There is Only One Camera

that is sent out loaded with 100 Eastman's films, and that is the Kodak. The patents on the Kodak and film are all owned by us and infringers will be prosecuted.
Send for Kodak Primer, free. Mention RURAL NEW-YORKER.

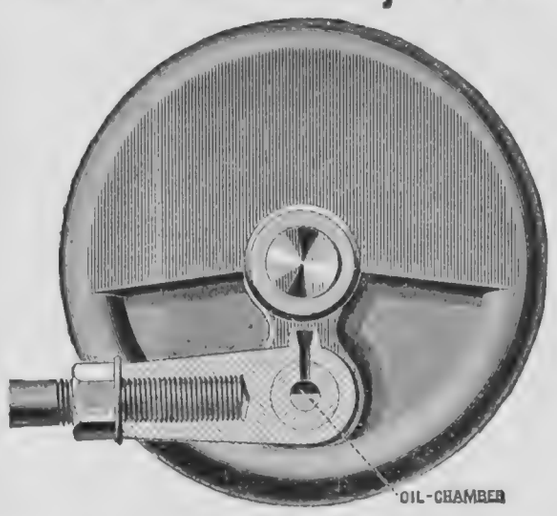
FREDERICK T. ROBERTS, M.D., Physician to and Professor of Clinical Medicine at University College Hospital, London, Eng., says: "Bright's Disease has no symptoms of its own, and may long exist without the knowledge of the patient or practitioner, as no pain will be felt in the kidneys or that vicinity." This accounts for many people dying with Bright's Disease, or advanced kidney malady. The disease is not suspected until it reaches a fatal period. If Warner's Safe Cure is used at the proper time, the fatality from that disease would be greatly decreased. Dr. Thompson also, says: "More adults are carried off in this country by chronic kidney disease than by any other one malady except consumption."

The Worcester Buckeye Mower



Ask our agents to show you the
SELF-OILING PITMAN
found only on the Worcester Buckeye. Be sure to see the new Big Six-Foot Mower. The lightest running machine ever put into grass. It has but two cog-wheels. Buy no machine until you examine the Worcester Buckeye.

DR. T. HEMAN BREHMER, an eminent German authority, says: Consumption is always due to deficient nutrition of the lungs, caused by bad blood." At the Brompton Hospital for consumptives, London, Eng., a statement has been published that 52 per cent. of the patients of that institution have unsuspected kidney disorder. This explains why the proprietors of Warner's Safe Cure claim that they have received many testimonials which they have not published, because of the incredulity with which they would be received were it claimed that Warner's Safe Cure cures consumption. But the fact is that if your kidneys be cured and put in a healthy condition they expel the uric acid and poisonous wsate matter, and prevent the irritation of the delicate substances of the lungs, thereby removing the cause. When the effect is removed the symptoms of kidney disease, which is called consumption disappears, and with it the irritation which caused it.

OUR FIRST FARMERS' INSTITUTE.

BY WM. ROSS.

CHAPTER VII.—CONCLUDED.

THE President consented, and they sang, "The Old Tin Horn."

When the song was finished the President said:

"The institute is now adjourned till one o'clock; be prompt in your attendance, and bring more ladies with you." This brought laughter and applause.

As the President was occupying the judge's stand, I suppose he thought he ought to imitate the court as nearly as he could.

Promptly at one, order was called. Pretty soon the usher was seen peeping round after vacant seats and crowding people closer together. During the afternoon the business was transacted in the same vigorous manner as before; as soon as one performance was finished, another was ready, without allowing any time to be wasted. When four o'clock came, the president adjourned the institute till seven o'clock.

"Mr. President, can't we meet at half past six?" asked some one in the audience.

"Yes!" replied he "let it be half past six then: be on time."

Notwithstanding the largest church in town had a booming meeting on hand, sitting room was in demand that night in the court-room, and the premonitions that the President had given the committee, a month before, did not now seem so visionary. After a half-hour of music and short addresses, Mr. Brown gave his inimitable lecture on "Wanted—A Man!" which was listened to with intense attention. As soon as the lecture was finished the choir rose and sang. When it finished, an awful silence pervaded the whole room. Every eye seemed to be looking intently at the President, as if asking, "What next?" He seemed to be at a loss to know how to break that silence. He thought that to proceed further would be malapropos.

Directly he said, "There is no fixed time on the program for the adjournment of the evening session. Whenever the institute so desires we will entertain a motion to adjourn" Immediately a motion to adjourn was passed. Just as the motion was put, Mr. Frisk arose, "I wanted to remark"——

"A motion to adjourn is not a motion to remark on," replied President Bark.

"I was going to suggest," Mr. President, 'that we meet a half-hour earlier to-morrow morning than the program sets."

"If there are no objections, I'll accept your suggestion."

"There being no objection, the institute is now adjourned till nine o'clock to-morrow morning," said the President.

"Why! that lecture was the finest thing I ever heard," said Professor Franks, "and when I came in here, and heard that choir sing; why! I was perfectly elated; why! here I was right in an old-fashioned singing-school! why! I didn't know, hardly, how to hold myself!"

There were a great many terse congratulatory commendations uttered, that were not excelled by the exuberant professor's ejaculations, as the crowd slowly passed out. The music had now become a very attractive feature. It was pure, unadulterated vocal music, with no organ or brass horn nonsense, or string instrument squeaking mixed up with it. That choir came to sing, and they sang. If a momentary lull in the business happened at any time, "Music!" "Give us a song!" "More music!" would be heard from the audience, and when the President would be passing in to commence business, he would receive such reminders, as, "Don't cramp the choir!" "Give us plenty of music!" "Mind the music, Bark," and Bark interspersed it liberally.

The business was conducted the second day with the same energy and with equal interest. The seating capacity of the room was filled to overflowing.

A committee on resolutions and one on permanent organization were appointed. The latter recommended a permanent institute to meet yearly, or as often as it may elect. Mr. Bark was re-elected president and J. Edwards vice-president. A committee on finance and one on arrangements for next meeting, were appointed. Soon after noon the president said: "I have been informed that our speakers have to leave on this evening's train. It may not be prudent to hold an evening session without them, and unless the institute order otherwise it will close at four o'clock. The committee will arrange accordingly." There were three good lectures delivered by the State speakers on this day.

Bill Bark's capacious program was not much too big; if the institute had held another evening session, it would have been just right.

The committee on resolutions resolved thanks to the good people of Woodside; to the eminent speakers, to the ladies and gentlemen of the New Agreement choir, and cordially invited them to come back to the future sessions of the institute; and the heartiest thanks to the various newspapers of Woodside, commending them for their great zeal in making this institute a success.

"Mr. Bonham requested that if I found any good manuscripts," remarked Mr. Brown, "to send them in for publication, and as there are several here, I would like to get them."

"I suggest," replied Mr. Bark, "that, as probably our home papers would like to publish them, and our people would like to read them, they be distributed to the papers, and that they then be sent, *printed*, to Mr. Bonham." It was so arranged. At four o'clock the whole audience rose and sang the long-meter doxology, and the institute was declared closed.

After the close, commendations and congratulations seemed to be the order. The following are specimens. I heard an old farmer ask Mr. Bark: "How often are you going to have these things?"

"About once a year, I suppose," replied Bark.

"Why, they are too good to wait so long for; why couldn't we have them oftener; every three, or six months?"

"We can have them if we just go at and have them," said Bark.

Mr. Brown was asked how our institute compared with others, considering it was our first?

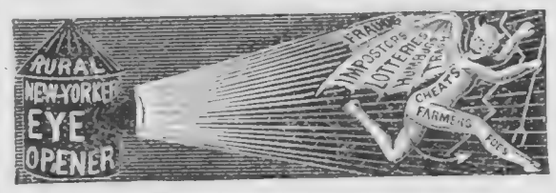
"It is away above the average of those I have attended," he replied, "and your own people have taken part in the various discussions, beyond my expectations.''

"How does it compare in attendance?" "Considering the horrible kind of roads you have, it is fully up to the average."

The next week all the papers devoted a considerable space to the institute. One of them gave it this "send off": "Last Monday a very respectable number of the farmers of Excellent county, whose appearance would compare favorably with most State legislative bodies, met at the court-house." The farmers are puzzled, however, to know just what that means. If the editor had been writing up a State legislative body and said it "compared favorably with that very respectable number of farmers," it could have been easily understood, and the people would have felt that their interests were safe in the hands of such a body.

Any locality that contemplates having a farmers' institute can have it by adopting Bill Bark's method: "The way to have it, is to just have it."

THE END.



Among the "dime novel" literature Indian stories have been yielding fast of late to detective tales, and the detective agency business has greatly increased. One of these facts may be a cause or a consequence of the other, or both may be simply "signs of the times." The number of bogus detective agencies, however, has by far transcended that of the real kind. Every large city has one or more and many smaller towns are not without them. They advertise pretty extensively through certain classes of papers and by circulars through the mails. Most, if not all of them "want agents all over the world." The only requirement is that the embryo detective should send $5 or sometimes $10 to the "agency," and keep his lips tightly closed as to his identity. If he isn't careful on the last point, the local police where he resides may hustle him to jail as a fraud. Of course, therefore, he can never even attempt to make an arrest lest such a folly might lodge him in the calaboose. All the aspiring Hawkshaw will have for his $5 or $10, therefore, is his own consciousness that he is a detective. The "agencies," of course, make big promises of profitable employment in hunting up all sorts of rascals, but, equally of course, they never intend to keep those promises, nor could they do so however hard they might wish. In nearly all the States the laws with regard to private detectives are very stringent. Substantially all provide that any person who shall engage in the business of a detective for hire or reward or who shall advertise his business to be that of a detective, without first having obtained a license so to do from the Court of Quarter Sessions of the county, or some other Court with jurisdiction in such cases, shall be guilty of a misdemeanor, and upon conviction thereof, shall be sentenced to fine and imprisonment of various amounts and duration. The law also generally requires bonds from the agency for security and as a guarantee of the legitimacy of its business. The J. C. Grannan Detective Agency, Cincinnati, Ohio, and the "Central Detective Department," Topeka, Kansas, have of late been particularly busy in this bogus business. All these agencies want is the $5 or $10, and all their dupes will ever get from them is a badge and a set of worthless credentials. Occasionally one, if specially troublesome or inquisitive, is punished by being started on a wild goose chase after some bogus or notorious criminal; but as he has to pay all his own expenses, and could do the same work just as well independently, he soon gets tired of it and settles back into the prosaic life of ordinary business routine.

THE other day, Judge Wickes, holding court at Chestertown, Maryland, gave a decision with regard to the validity of a note given in payment of "hull-less oats" which had been sold on the plan practiced by the Bohemian oats swindlers. The case was docketed Meginnis *vs.* Johnson. The latter gave a note for $100 in payment for 10 bushels of oats. At the same time he received a paper in the form of a contract which bound the "Grain and Cereal Company," of Carroll County, Maryland, to sell for said Johnson 20 bushels of the crop from the purchased seed at $10 per bushel, so that the oats and the contract were the consideration for the note. This note fell into the hands of Mr. Joseph Meginnis, who, of course, assumed the role of an "innocent holder." He managed to obtain from Johnson a second note for $80 in lieu of the original note for $100. The court gave judgment in favor of Johnson, and imposed all the costs upon Meginnis, declaring that the whole transaction was a fraud, and that the holder of the note had knowledge of its fraudulent character. Meginnis's attorney set up a claim that a law passed in 1888 forbidding such fraudulent schemes as the Hull-less oats, Bohemian oats, and Red line wheat swindles, prevented the Carroll county fraud from fulfilling its contract; but the court decided that the act was no bar to any legitimate business in oats or wheat and only interfered with fraudulent transactions. The judge said that, while notes in the hands of really innocent parties could be collected, it was against public policy and good morals to enforce an obligation under the circumstances, and the court would not sanction it. It is one of the laws of nature that, as a rule, a fool should suffer for his folly, but the people of that class who have had dealings with these grain swindlers, may, by boldly resisting the payment of their notes, very often escape the results of their folly, at least, in part.

ONE of the New York daily papers the other day gave up a column and three-quarters of its space to the exposure of a "wicked swindle" with which it charges the "New York Laundry Works," of 23 Dey street, this city. This concern widely advertises that it "will send, as a FREE GIFT, a full suit of clothes for a gentleman or a dress pattern of black silk for a lady" to every one who will send $1 for one of its wonderful automatic family washing machines, show it to his or her friends and help along the sale. The machine is said to retail at $2 and is puffed up to the skies. The concern boasts of having sold 100,000 washers last year. Great inducements are offered to agents, and the advertisement, though very beguiling to the gullible, to people of ordinary shrewdness bears on its face all the marks of a swindle. On investigation, it turns out that the concern says it will give the dress only to those who will buy $75 worth of the machines in one year, although the advertisement plainly says that it will send a machine and a $30 dress to every person who will forward to it $1 and be willing to extend its sales. It is said that the machine will do a family's washing automatically in 30 minutes, but a test proves that the little thing is utterly worthless and couldn't do a family's washing in 30 years. The business quarters of the "Laundry Works" consist of a small, dirty, ill-furnished, carpetless office over a corner rum-mill. The occupants are a young girl busy mailing circulars and a couple of impudent young men, proprietors of the "Works," who are prompt to jeer at a greenhorn who expected to get a $2 machine and a $30 dress for $1. Is this the only concern of the kind in the country? Why, bless you! no. There are hundreds of others just as bad scattered in all the big cities in the Union, with a fair sprinkling in smaller places.

THE "salvage sale" swindle, conducted by Prescott, Reid & Co., of Boston and Chicago, is denounced in many parts of the country. The circulars of the concern announce that it has been granted special license from the Custom House to sell to consumers only damaged cargoes of English, Scotch and French goods secured from various wrecked steamships, the names of which are generally given. The list of the goods is presented, and the amount of the loss through the wreck is stated. Samples of the goods marked at extremely low prices are appended. Agents are going around distributing these circulars, and the following day they generally appear with inferior dry goods, purporting to come from the wreck. Investigation proves that none of the wrecks mentioned ever occurred; that no arrangement had ever been made with the Custom House; that the latter would never consent to any such arrangement as that mentioned, and that the concern consisted of a pack of scoundrels bent on cheating the public by palming off on the ignorant, over-greedy and unwary a cheap, poor class of home-made goods under the guise of fine, expensive foreign fabrics slightly damaged. Several of the "agents" of the concern have been arrested in different parts of the country. The RURAL has often exposed such swindles, and our readers should remember that each of the dishonest schemes mentioned here is merely a specimen of a number of others of substantially the same stripe. It is rather improbable that Prescott, Reid & Co. will ever again—under this title at any rate—appeal to the greed or gullibility of the public: but other concerns of the same kind are sure to do so, and this is a warning against these rather than against the concern mentioned, which is certain to collapse soon, if it has not already done so within the last few days.

AN ARBOR DAY CELEBRATION.—The May issue of the Journal of the Columbus (Ohio) Horticultural Society contains an account of the Arbor Day celebration carried out by the students of the Ohio State University. The exercises consisted of various speeches and orations delivered by members of the different classes and others. The average college boy is a great hand at a speech; he only needs an audience and an occasion. Arbor Day would seem to be peculiarly fitted to draw out the college poet, but the following is the only specimen of original poetry we find in the report:

POET-TREE.

"Oak, Caroline! for yew I pine;
O willow, will you not be mine?
Thy hazel eyes, thy tulips red,
Thy ways all larch have turned my head,
All linden shadows by thy gate
I cypress on my heart and wait;
Then gum beech cherished, Caroline;
We'll fly for elms of bliss divine.

O, spruce young man! I cedar plan—
Catalpa's money, if you can;
You sumach ash, but not my heart;
You're evergreen, so now depart;
You'd like to poplar—that I see—
Birch you walnut propose to me—
Here's pa! you'll see hemlock the gate;
He maple litely say 'tis late!'

Locust that lover, while he flew
For elms before that parent's shoe;
He little thought a dogwood bite
And make him balsam much that night,
Hawthorny path he traveled o'er,
And he was sick and sycamore."

Well, well, well! Poetry must have been starved out of that college or else they had some very sensible men in charge of the programme.

SUGAR FROM SORGHUM.—Chemist Wiley of the Department of Agriculture, has issued a pamphlet, bulletin 20, giving a record of experiments conducted at Rio Grande, Benner, Conway Springs, Douglass, and Sterling. All who are interested in sorghum sugar will find this pamphlet valuable. There are two points of particular importance. One is the report of the chemists who have analyzed frosted cane. Less than a year ago it was found next to impossible to obtain an analysis that would show the effect of frost on growing corn fodder. It is shown in this pamphlet that a light frost injured the juice in sorghum cane, rendering it lower in solids, lower in sugar, and of less purity. Another topic of practical value is that involving the points to be considered in building a factory for sorghum sugar. A bountiful supply of water is absolutely necessary. A factory must be located where there is no danger of a water famine. Cane now brings a price of $2 per ton at the factory. It will thus be seen that no farmer can afford to haul an ordinary load of it much over a mile. Thus the factory must be in the center of an area of growing sorghum. Suppose the factory could be placed so that all the land within a radius of one mile could be in cane. This would give 2,000 acres, producing say, 20,000 tons of cane. Increase this radius by half a mile and the number of acres tributary to the factory will be greatly increased. We see that the sorghum sugar business is to be conducted somewhat on the principle of the whole-milk creamery, the difference being in the heavier weight of the cane and the greatly increased cost of getting it to the factory. Doubtless the time will come when the factory will find it necessary to extend narrow-gauge railroads into the country about it so as to still further reduce the cost of hauling the cane. Another important point to be considered is the securing of a cheap and abundant supply of fuel. It is therefore necessary that the factory should be in a position so situated that coal can be readily hauled to it. Some economists have advocated the burning of the chips from which sugar has been extracted, but practical experiments have not yet demonstrated the wisdom of this plan It will evidently cost more to prepare the wet chips for fuel than coal would cost. It will be seen from these facts that the production of sorghum sugar will be confined to certain sections of our country where cheap and easily tilled lands can be secured. Chemist Wiley is of the opinion that the Indian Territory offers the best chance for a development of the industry. The cost of a plant suitable for developing the enterprise is so great that the business can only be conducted on a large scale, and like the business of producing cane sugar or cotton will necessitate the employment of cheap labor in order to produce cheap sugar at a profit.

FOWLER AND FARRINGTON, TAUGHANNOCK FALLS, N. Y.—Circular of sulky plows, road carts and hay cars. This firm make three styles of hay cars. Send for their circular.

FISH BRAND WATER-PROOF CLOTHING.—Catalogue from A J. Tower, 18 Simmons Street, Boston, Mass. This article of clothing is designed for the use of farmers, stockmen, herders, doctors and others whose business calls them out into the rain. The material of which this clothing is made is claimed by the manufacturer to be lighter, more durable and cheaper than rubber. Here is an extract from the catalogue, which the R. N.-Y. can heartily endorse:—

"The importance and pleasure of keeping dry in wet and stormy weather can be appreciated only by those who never enjoyed the luxury of a perfectly waterproof garment. Many dollars, and what is more important, many lives are annually lost through want of a proper and sufficient protection against rain and wind; and farmers, and others whose business is out-of-doors, are compelled to lose many valuable days' labor, which they otherwise would not, had they perfect protection from the rain."

Send for the pamphlet and see the new designs for water-proof clothing shown in it.

Does heating milk affect the quantity or quality of butter?

This topic is discussed by Director I. P. Roberts in the latter part of bulletin No. 5 of the Experiment Station at Cornell University. This investigation was started by a reply made by Mr. E. W. Stewart to a reader of the Country Gentleman, who found that milk from high-grade Jersey cows would make but one pound of butter from 28 pounds of milk. Here is what Mr. Stewart said:—

"It is highly probable that not more than two-thirds of the fat is obtained from this milk. If this milk were heated in a water bath to 135 degrees, immediately after milking, and set in shallow pans in a temperature of about 60 degrees, the amount of cream and butter would be largely increased, and the cream would churn in the same time as from fresh milch cows, and probably it could not take more than 17 to 20 pounds of milk to a pound of butter. But if the cream be raised by cold deep setting, then it should be set directly from the cow, and the cream may be heated to 130 degrees when skimmed, and after ripening will churn much better for it and make more butter."

On the other hand, Professor Roberts has the following report from a firm of extensive and very successful dairymen:

"We took some milk from the vat just after milking, and after stirring it thoroughly we took two samples of exactly the same amount. One sample was scalded at 120 degrees, the other without scalding, and both stood for twenty-four hours in ice water at 40 degrees; they were then both closely creamed, the cream ripened and the two samples churned, worked and in every way except the scalding treated exactly the same. The scalded milk produced 6 lbs. 11 ozs. and the other 5 lbs. 15½ ozs. The former was white and pasty and could not be worked into butter; it was impossible to get the buttermilk and curd out of it; the latter made a good product of marketable butter.

"We then took two samples, each of the same amount exactly, heated one to 120 degrees and left the other normal and put both in ice water the same as before for 20 hours. They were then ripened without skimming and treated exactly the same, churned the same and worked the same and in every way treated alike except the heating. The scalded milk produced 4 lbs. 5 ozs. and the other 2 lbs. 1¾ ozs. That from the scalded milk had the appearance of Dutch cheese and could not be worked into butter; it was impossible to get rid of the curd and buttermilk. The other was a very handsome sample of well-colored marketable butter. These tests were both made with the utmost care in every particular. The test of the scalded milk made without skimming showed more curd than when skimmed, and hence the larger proportionate product."

The detailed experiments carried out to settle the question raised by these statements are too lengthy to be given here. Those who care to study them may secure the bulletin. It may be stated briefly that the parcels of milk, each containing 14 pounds, were treated as follows: No. 1, set direct from the cow at a temperature of 93 degrees. No. 2, cooled to 60 degrees, strained into another can and set. No. 3, cooled to 60 degrees and then warmed to 93 degrees. No. 4, cooled to 60 degrees and then warmed to 135 degrees. All were set in a Cooley creamer with water at 40 degrees. Again, 48 pounds of milk were set at 90 degrees, 48 pounds first cooled to 60 and then warmed to 135 degrees, the same amount set at 88 degrees and the same amount cooled to 60 and warmed to 135 degrees.

Two other tests were made just about like those given above. The returns in cream and butter were carefully recorded and careful analyses of the milk were made. Here are the conclusions reached by Professor Roberts:

"We may conclude as the result of these investigations, first, that there is a loss of butter when the milk is allowed to cool much below the normal heat of the cow before being put in the creamer; second, that while there may not be any very great increase of butter when the milk is heated there is no risk of injuring the quality of the butter by incorporating an excess of casein even when the milk is heated as high as 135 degrees."

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

PROPERTY RIGHTS OF MARRIED WOMEN IN NEW JERSEY.

S. T. M., Williamsport, Pa.—I have been assured that in New Jersey a married woman has no personal rights in her own property, all of which is absolutely owned by her husband, and that she cannot even make a valid will. An instance was given by my informant, of a woman who left her husband on account of his cruel conduct, and went to her father's house, to which the husband followed her, and actually carried off her trunks with their contents, claiming that they were his property. It was also declared that in that State a married woman with some means can be compelled to support a worthless, drunken husband who refuses to work or give her any money. Can this be so in any State of the Union at the close of the Nineteenth Century?

ANS.—No; our inquirer has been sadly misinformed. The old laws with regard to the rights of married women in New Jersey were no doubt unjust, as were all old laws everywhere with regard to the same sex; but since the passage of the amendments of March 27, 1874, the property rights of the women in New Jersey appear to be ample and well protected. The real and personal property of any woman in the State, who has married since July 4, 1852, which she owned at the time of her marriage, continues her sole and personal property as if she were still a single woman. All rents and profits derived from it are hers. Her wages, earnings and all income from her separate business and from all investments made by her belong absolutely to her. She may bind herself and her property by contract, with a few unimportant exceptions, as if she were single. Any will or testament made in due form of law by her, if she is above 21 years of age, concerning real or personal property, is as valid and effectual in law as the will of any other person. She may sue and be sued in her own name without joining her husband, and she is not liable for his debts or support. Thus, it will be seen, New Jersey is fully abreast of the foremost of the other States in reference to the legal rights of married women with regard to their own property.

LAW WITH REGARD TO TRESPASSING FOWLS.

E. L. B, Bergen, N. Y.—One of my neighbors, among a lot of other bothersome fowls, keeps a flock of about 40 Guinea hens. These he keeps all the time on my grounds. Indeed, if they go home, he drives them back across the road again. At seeding and harvesting time they do a world of damage. Last fall they ate nearly all there was of 2½ acres of fine buckwheat. He promised that if I would say nothing about the matter, he would not keep any this year; but he has just told a neighbor that he will keep them because they stay away from home nearly all the time till late fall, and he said that he could pay for all of my buckwheat they might eat. If I shoot some of them, I think the rest will be scared permanently away, or else their owner will keep them out of mischief on my land. Have I a right to do so?

ANS.—This is certainly a hard case, and that is certainly not an agreeable neighbor; still our inquirer has no legal right to shoot or poison the trespassing fowls. Even a notice served upon their owner that our justly exasperated friend intends to kill them, is merely a threat to do an illegal act, and will make no difference in the legal aspect of the case. It has been frequently decided that the poisoning of a neighbor's hens, even after repeated trespasses and warnings of an intention to kill them, was a wrong for which an action would lie. The owner of an animal, however, is liable for its acts, and the present is such an aggravated case that, no doubt, the full amount of the damages done by the hens, not during the past year only, but during former years within the scope of the statute of limitations, could be readily recovered by legal process.

TRESPASSING DOGS: FENCES IN NEW YORK STATE.

L. S. M., Westchester County, N. Y.—I live in New York City, but have a country house with several acres of land in this county. It lies along a public thoroughfare and is unfenced. Dogs belonging to the neighbors enter my grounds, injure my flower-beds, kill my chickens, and cause much other annoyance. Have I a right to put poisoned food in their way? If not what am I to do?

ANS.—It depends somewhat on circumstances. It is quite lawful for any person in this State to kill any dog the tax on which has not been paid, and in a suit for damages arising from such killing the burthen is on the owner to prove that the tax has been paid. In case the dog is licensed and the tax has been paid, no one is at liberty to kill it for the offense complained of by our inquirer. Section 44 of the law relating to fences in this State provides that whenever the electors of any town shall have made any rule or regulation prescribing what shall be deemed a sufficient fence in such town, any person who shall thereafter neglect to keep a fence according to such rule or regulation. shall be precluded from recovering compensation in any manner for damages done by any animal lawfully going at large on the highway, which may enter on the lands not fenced in conformity with such rule and regulation. If our correspondent's premises were properly fenced, or if no regulation with regard to fences has been adopted in his town, the owners of the dogs will be liable for the damages done by them on the premises; but our inquirer has no legal right to kill the dogs by poison or any other means.

RIGHT TO WATER FROM A SPRING ON A NEIGHBOR'S LAND.

L. K. E., Seneca County, N. Y.—On my farm there is a spring of water that rises about eight rods from the boundary line and then flows on to a neighbor's premises. The neighbor has a lead pipe to the spring, and through it his house is supplied with water. The pipe was laid about 35 years ago, permission having been given by my father, now dead. No written contract or deed was made. I now want the spring for my own use. Have I any right to it; or can my neighbor hold the water by proving peaceable possession of it for 35 years.

ANS.—Even if the water issuing from the spring upon our inquirer's land were conveyed to that of his neighbor by a natural watercourse, without the intervention of a lead pipe, our friend would have no right to divert the water to his own use. It has been often held by the courts that the diversion of the water of a spring from its natural channel by the owner of the land whereon it is situated, whereby a lower owner is deprived of the use of the water, is a legal injury for which the latter is entitled to compensation in damages. The fact that in the present case the neighbor has for so long a time been allowed to convey the water in pipes should strengthen the case. When existing rights have been settled and fixed by mutual agreement, and the agreement has been carried out and acquiesced in, and the privileges have been enjoyed for 20 years without complaint or objection, neither party can gainsay his own acts or complain of any results flowing from them.

T. H. H., Charleston, W. Va.—I own a farm on a stream in another part of this State. The land-owner below me on the stream has had a flour mill for upwards of 30 years, and there has been a dam across the stream for the supply of water. Even in its present condition when the stream is swollen by rains, it causes an injurious back-water on my land. The owner proposes to raise it still higher, so that the injury to me will be greater. Can he legally do so?

ANS.—No; a prescriptive right such as that possessed by your neighbor, cannot be enlarged to the injury of another.

The boss told me to put insect powder on it this morning."—*Time.*

A SMALL boy is rather slow in committing prayer to memory, and requires a good deal of prompting. The other night he began in his regular way: "Now—I—lay—me"—and there he stuck fast. "Down," said his mother prompting. Whereupon Johnny set off again with great alacrity and fluency: "Down came a blackbird and nipped off her nose!" This fable teaches that the preference of the present generation for secular over sacred literature begins at an early age.—*Boston Transcript.*

STOCKBRIDGE **CORN** FERTILIZER

Photograph of a Field of Corn raised on Stockbridge by J. B. Griffiths & Sons, Newmarket, N. H. Yield 400 baskets from 2½ acres.

The introduction of the Stockbridge Corn Manure in 1876, by Prof. Stockbridge of the Massachusetts Agricultural College, gave a great impetus to New England agriculture, and was the means of inducing farmers to raise corn rather than buy it, thereby saving thousands of dollars to eastern farmers. Before this fertilizer was introduced, it was thought that corn could be bought cheaper than it could be raised; but farmers soon learned that with the Stockbridge Corn Manure and improved tools they could raise it for from 25 to 50 cents per bushel, and that the stover, if properly cured, was worth almost as much as stock hay—at least $8 per ton—and that the two or three tons stover raised per acre would pay for the fertilizer the corn remaining to pay for the labor and profit. The standard of the Stockbridge Corn Manure having been kept up to that of 1876, more farmers are using it than ever before.

Dairy Husbandry.

ON A WOMAN'S TWO EXPERIMENTS.

ALTHOUGH since we adopted the creamery system, my daughter and I have no business in the milk-room and buttery, I was seized with an experimenting mania one day last fall, and went into the quarters where once I reigned and slaved, and undertook a matter of proof. By the way, I ought, perhaps, to state that we are always trying some experiment or other on our farm, from hen-feeding and seed-soaking, to fertilizer adaptations and scientific crossing. Indeed, my daughter once had some note-paper printed with the heading "Tentative Farm." Consequently there was nothing new about my undertaking. Terry, the hired man, suggested the idea, simply because he did not fancy the new *regime* that excluded women from the dairy, and placed the men folks there.

"Mar'm," said he to me that morning: "I don't want yer ter think I ain't right up-and-down in favor of them new-fangled thing-umbobs, but I can tell ye one thing!"

I suspected his disinterestedness, but inquired as to the character of the "one thing" which exercised his mind.

"Jest this," he said. "Butter made by that ar process isn't goin' ter keep as well as that made usin' the pails!"

"We'll see," I said, and my experiment was the labor of "seeing."

I wrote out the question carefully, and set out to answer it. "Will the Cooley process make an article of butter that will keep well, all else being equal?" It would take more space than I wish to occupy to narrate my experience in detail. Suffice it that my answer came affirmatively. I, however, qualified it with an "if"—*if* the butter is properly taken care of. I found that if more than one skimming is to be churned, the first ones must necessarily be kept cold until the last skimming is off, and then all must be thoroughly and carefully mixed, and warmed to from 60 to 62 degrees. The stirring has to be frequent until acidulation begins, when the different skimmings are to be churned at the same temperature. I always stirred cream when it was ripening, as I maintain that ripening consists in airing, rather than in souring, so the more stirring the better. Thorough ripening promotes high flavor and long-keeping qualities, and goes on better when the cream is warm and sweet, instead of when it is cold and sour. If 15 years of experience go for anything, it goes to show that when cream begins to sour it begins to spoil, and that the sooner it is churned after beginning to sour, the better the butter will be. Here is my idea exactly:

"Professor W.A. Henry's dairy experiments go to show that the ripening of cream before churning increases the yield of butter from 15 to 20 per cent. over the yield from sweet cream, provided that both are churned in the same way. The ripening of cream appears to have no marked influence upon the time of churning. The mixing of sweet with sour cream just before churning does not result in any advantage to the sweet cream, the same loss being incurred as when each cream is churned separately. The same increase in the yield of butter produced by ripening the cream may be obtained by adding acid to sweet cream just before churning." If that is heresy, make the most of it!

I went clear up into the rye field to tell Terry the result of my experiment, when what should the fellow do but suggest another!

"Look 'e here, mar'm!" he began. "I will shet up on that score; but lemme say my say on another thing. Yew brag of yer butter bein' of better grain; but I'll bet yer that ter make the best grained butter it must be worked by hand instid of by machine."

I saw right through him. He wanted to get out of operating the Eureka butter-worker, and to get me back with my hands in the wooden butter bowl. Of course, if he were right I would go back, but—

Well, I puttered. I should think I tried for a fortnight, and then I set my mind to rest. Butter to be of perfect grain must be worked by the machine. That was what I concluded.

"How do you do it?" the editor of our paper asked me at the fair, and I wrote it out for him.

DIRECTIONS: After the butter is taken from the churn and placed on the worker, I put into every pound of it an ounce of salt. I let it stand for two hours, and then put it on the worker, gathering up the moisture with a cloth. It is worked as little as possible, and packed at once in my one-half pound molds.

That is all.

Some doubted, and differed from me, but I did not care, as I had my mind fixed and my plans were not faulty. I append to my article a bit of matter, which, as it is in the nature of a commentary on my *material* for experiments, I will quote as my own.

"One of the reasons why much poor butter is made in private dairies is that the farmers generally begrudge their wives and daughters the most improved appliances for the household work. They buy reapers, thrashing machines, feed-cutters, grinding mills, seed drills, and sulky plows, but when it comes to a butter-worker or a creamer, there is no money for 'such new-fangled things.'"

ONLY A WOMAN.

DAIRYING.

"THE GENERAL-PURPOSE COW:"—There is not so much talk now of the general-purpose cow as there used to be. When a man says he prefers a big cow with beef points so that he can feel wealthy when he sells her for old-cow beef (after the poor old thing has worked hard in the dairy for 10 years, averaging only 150 pounds of butter per year), it is time to persuade him to get out his arithme-

A PHOTOGRAPHIC VIEW OF THE R. N.-Y. LAKELET, LOOKING WEST. Fig. 133. See page 369.

tic and do a little figuring. His attention should be called to the fact that he feeds his beef for 10 years before he realizes a cent on it: and if he can be induced to make an honest calculation of the cost of his beef, and if he then tries to subtract that amount from what he gets for it, he will become a convert before he gets through the job. Feeding a 1,400-pound cow for 10 years, getting meanwhile 1,500 pounds of butter from her, or feeding a 900-pound cow for the same length of time and getting 3,000 pounds of butter, which is the more profitable? There are some who can't answer that rightly, or, to put the matter in another way, say the big cow makes as much butter as the small one during 10 years of dairy work, is she as profit-

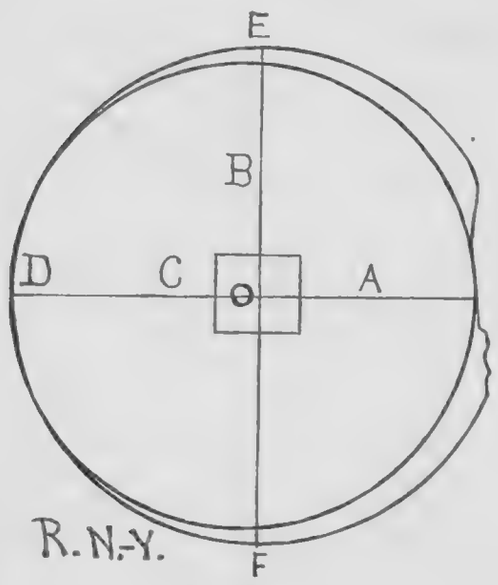

Fig. 134.

able? "Yes, because you have 500 pounds more beef to sell." Well, my friend, I sympathize with you; I thought that way myself once, but I don't now.

STEER DAIRYING: I used to believe that steer dairying brought in the most money. I had it all down on paper as plain as could be, but somehow it would not work out right in practice. In steer dairying, as in all other kinds, the bull plays a very important part. He must have beef points in order to give us good steers, and if he has beef points well developed, his milk points are just the reverse. So we try to coax ourselves to believe that a beefy cow will pay her way with the help of the steers. But will she do it? Not in the East where land and feed are high; or in the West where dairying is made the business of the farm; but where land and feed are cheap and labor scarce and there is plenty of pasture, a man may make a living by steer dairying, but so he may by turning his hogs into the corn-field to save the expense of harvesting. Butter, milk, or beef? If you choose your cow for one of the three you are safe; if for two, you are carrying a useless and expensive burden: but if for all three—

THE SILO:—It looks now as if the dairyman will be compelled to feed silage if he expects to get the best profit. Silage as it comes out of the silo, is the same feed that went into it, only it is partially cooked. It gives a succulent feed, cheaper by far than any root crop, and as much better as it is cheaper. We cannot afford to grow roots in competition with ensilage corn. The silo saves feeding so much hay; more hay can be sold, and those living within reach of a good hay market this winter will appreciate the silo more than ever. If any one is now more prejudiced against the silo than I once was, he is to be pitied. I read about it until I hated to see the word in print. I read the experience of those having silos

Fig. 135.

and fancied I could see how they were trying hard to persuade themselves that ensilage was a good thing, and in the course of time I found myself shoving green corn through a power cutter, and now I believe those men were right. So we must not let our prejudices run away with our good judgment, no matter whether they pertain to the silo or the cow. We can make a profit by feeding dry corn fodder, but if we can make a greater one by feeding it green, why not do so? When a man shows that he has made a profit in dairying while keeping big cows, he ought to be amenable to reason and see if he can not make a bigger profit with smaller cows.

THE CHURN:—Our grandmothers used the upright dash churn, gathered the butter in a lump, worked out the butter-milk and worked in the salt with their hands, and printed it by shaping the pat on the mold with those same hands. And they always got the bottom of the print just convex enough so that it was impossible, when the butter was on the table, to cut off a slice without turning the print upside down. That butter had the true butter-milk flavor, and there are many to-day who insist that brine-washed granular butter has no flavor. So much for what we are used to.

THE THERMOMETER:—Why, a thermometer on a farm in those days was as rare as I hope the general-purpose cow will be by the time the RURAL grows 500 bushels of potatoes on half an acre of ground. (Don't smile, friends; you and I will live to see it; it is only the good that die young.) The cream was tested as to its temperature and acidity by the finger and tongue. But now, through the medium of the farm papers, the use of the creamery, the churn with no dash, the butter-worker, the thermometer, and all the modern implements

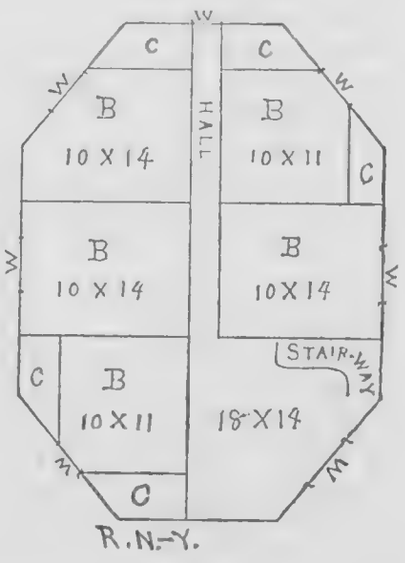

Fig 136.

and methods of dairying, is becoming the rule instead of the exception. A. L. CROSBY.

Horseman.

CLOVER HAY FOR HORSES

Mr. Terry's Plan Considered.

THE SECRET OF HIS SUCCESS.

A Matter of Farm Adaptation.

Best Quality Clover as Good as Oats.

POOR CLOVER HAY WORSE THAN STRAW.

AS OUR readers know, Mr. T. B. Terry, of Ohio, is a man who does not hesitate to think and act for himself. He does not farm in any "rut," but follows the practices that seem best adapted to his own farm conditions. For example, Mr. Terry decided some years ago that it would not pay him to raise grain for his horses. He also decided that good clover hay would keep them in good condition without any grain. Thus for seven years his horses have not eaten grain. A very full account of his way of feeding and the reasons for it were given on page 68 of the RURAL for the current year. In the Hay Special, page 329, the plan followed in curing clover hay was given. This system of feeding no grain has caused quite a little comment. Below we give the views of some of our correspondents.

FROM C. S. RICE.

Mr. Terry's success in keeping his horses on clover hay without grain is not a surprise to me. Many years ago a man just over from England fed and drove my team for the season. He was an expert plowman and manager and trainer of farm horses, having been employed on a large farm in that capacity nearly all his life. My team was fed good Timothy hay and from four to six quarts of oats three times a day for each horse. After feeding and driving the team two or three months, he said to me that he would as soon have such clover hay as he had been accustomed to feed to horses in England without any grain as to have my Timothy and grain combined. As he was a man of experience, truthfulness and sound judgment, I believed his statement to be true, but as perhaps one-third of the horses in this section had the heaves and many farmers thought clover was the cause of the trouble, I continued to feed Timothy hay and grain. A few years afterwards, however, when I began raising clover without mixing it with Timothy, some of it was put in the horse barn, and I then thought and still think that it was by far the best hay ever fed to my teams. It was cut when just red over the field, and nicely cured in the cock. The same season I discovered the great value of such clover for cows giving milk, and have since fed it to them rather than to the horses.

With the crops raised on Mr. Terry's farm and the amount and kind of labor required of his horses, his method of keeping them is, no doubt, the best and cheapest that could be practiced. Where teams are required to do steady full labor for months in succession a more concentrated ration may be needed. Again, where a crop of peas and oats can be grown to more profit than wheat, I think that a team can be kept in the comparative idleness of winter on straw and grain as cheaply as on clover hay. My horses weighing 1,200 pounds each, are fed pea and oat straw, and 12 to 15 quarts of pea and oat meal and bran mixed in equal bulk. They are harnessed nearly every day, but their work is light. They are well wintered in this way and I have never known them to be sick when so fed. In spring, Timothy hay is used instead of straw. Having clover hay, and peas and oats and straw, and cows giving milk, and horses to winter, I would feed grain and clover to the cows and grain and straw to the horses. In Northern New York wheat cannot be raised with profit when prices are as low as they have been for the last few years; but peas and oats yielding double the number

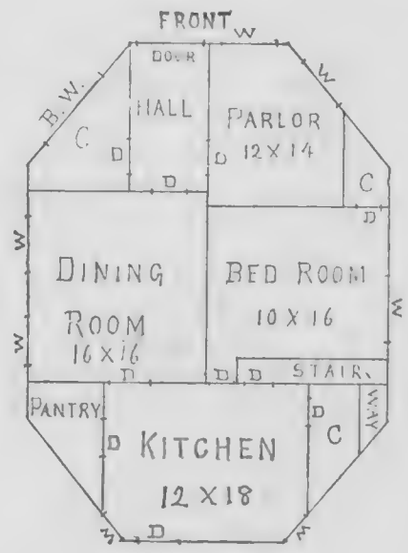

Fig. 137.

of bushels to the acre and weighing 40 to 50 pounds to the bushel, can be raised and profitably used on the farm for feeding cows, horses and pigs. I doubt whether keeping horses on clover hay alone would result in any gain over my present method that has been in use many years.

Lewis County, N. Y.

FROM SAVAGE & FARNUM.

Mr. T. B. Terry's plan of feeding simply hay and no grain is undoubtedly the best plan for him, but there are many things to be taken into consideration in connection therewith. The personal care, and, no doubt, kindly treatment, though Mr. Terry makes no mention of the latter farther than to say that his horses are not worried by the driver, have a great deal to do with the fine condition of the animals.

There is not much doubt that Mr. Terry could with the team he mentions, fed on good clean wheat straw and carrots, do more work and keep them in better condition, than the brawling Jehu with his big whip would do with a team fed on the best hay and oats. The exhibitions of life Mr. Terry speaks of, are no doubt in a measure due to good fellowship between driver and team rather than to the crack of the whip and the terrorizing howl so often indulged in by the ordinary teamster. But to get back to the hay question: Mr. Terry's hay is cut so as to save all of the properties that it originally contained, while most hay is handled so as largely to destroy the life-sustaining principle it contains. Then again, the character of the land upon which hay is grown has largely to do with the quality and consequently the value of the produce. It is possible on good land to produce hay containing all the qualities requisite for the building up of the frame and muscular tissues of a horse and sustaining him in good health and condition while doing a fair amount of work; but many horses are compelled to perform unreasonable tasks. Nice attention to the an'mal's bodily comfort is not thought of, and to adopt the no-grain theory generally would soon leave us a sorry-looking lot of horses and there would be no economy in the end, as oats at $20 per ton are cheaper than the average hay at $10 per ton and grain generally is cheaper than hay when its real feeding value is taken into account.

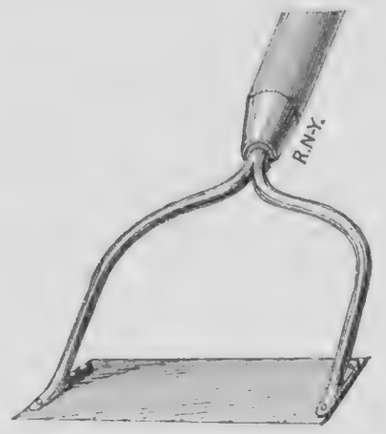

Fig. 138.

FROM JOHN M. TRUE.

My experience in the use of early-cut, well cured clover hay for horses, has led me to a very enthusiastic belief in its superiority over all other kinds of hay or coarse fodder. I consider it admirably adapted to the promotion of the best results as a feed for growing colts and brood mares, and these animals, notwithstanding that a change of feed is conducive to healthfulness, as well as welcome to their tastes, might thrive well on clover hay, without grain, were it necessary to restrict them to any one given feed. But in my opinion the feeding of less hay and a little wheat bran or whole oats, will not only prove more acceptable to the animals, but also tend to better results in building up the bony structure of the growing young, as well as in promoting its general thrift. In my own case, I consider such a mixture of feed, as also an occasional feed of corn fodder, and even straw, not only economical but healthful.

With the work horse upon the farm, I would also use clover hay, but would prefer to feed less hay and a grain feed, as tending to less distension of the stomach, furnishing a more concentrated ration, enabling the horse to perform heavy continuous labor with greater ease and less waste of forces. I do not consider clover a good feed for horses that are subjected to hard driving upon the road, unless very lightly fed, preferring good Timothy hay, and a liberal supply of oats. I do not doubt that Mr. Terry has been able upon his small farm, in his systematic and gentle handling of teams, to produce the exact results he claims; but I do not believe that our larger farmers who subject their teams to hard, continuous labor, will do well, in their appreciative regard for clover hay, to ignore other equally natural and healthful food rations furnished by some of our grains.

Baraboo, Wisconsin.

FROM J. W. BOOKER.

I have read with interest Mr. Terry's article on clover hay for horses, which tells of a practice entirely new to me. I cannot find a horse-

Fig. 139.

owner in this vicinity who favors Mr. Terry's plan of feeding all hay and no grain, especially for working horses. I doubt if our Western farmers with whom the raising of horses is so important a part of their work, would be able to mature a colt as early as they now do, without grain. My experience in raising colts proves, to my entire satisfaction, that plenty of grain is necessary for early maturity as well as for production of bone and muscle.

Champaign, Ill.

FROM DR. F. L. KILBORNE.

I was very much interested in the article in the RURAL of February 2, by Mr. T. B. Terry, on his method of feeding clover hay and no grain to horses. I am not surprised at the general distrust as to the merits of Mr. Terry's method; neither am I surprised at the results obtained by such feeding under the conditions mentioned. As a rule, people are too distrustful of any new method, that is not in accord with their own experience; and they rarely study such methods in detail, in which case it might appear not only possible but practicable.

The success of Mr. Terry's plan is undoubtedly due to at least three favorable conditions, the failure of any one of which would materially change the result.

1. THE QUALITY OF THE CLOVER HAY.—The general impression that clover hay, when fed to horses in considerable quantity, is liable to cause heaves, is more than half correct; but the result is due largely, if not entirely, to the quality of the hay, and not to the fact that it is clover. We have always fed more or less clover hay to our horses with uniformly good results; but only when the clover was first-class. Owing to the difficulty in curing green clover, there is a large proportion of the clover hay that is of poor quality. It is this poor clover that causes heaves.

It is not an uncommon experience for farmers to keep their horses in excellent condition on good pasture without feeding grain. These same horses will perform a moderate amount of labor, even quite hard work if carefully handled. Few farmers would be surprised by the publication of this fact. The method adopted by Mr. Terry is quite similar. Instead of feeding exclusively on grass, he feeds clover hay, improved by a small proportion of Timothy. The difference between these two methods is not so great as might at first appear. If we look at the nutritive digestive ratio of the ration given by Mr. Terry we find that it is fully up to the average. The nutritive ratio of best clover hay is about one to 4.5. The ratio for the best Timothy hay is considerably higher, being about one to five. In pasture grass the average ratio is about one to 4.5. The ratio of an average ration of meadow hay and oats is about one to six or seven. We thus find that the ration as fed by Mr. Terry is even richer than that received by the horse fed on an average hay and grain ration. This is due to the difference in the ratio of the best quality of hay and hay of an average quality, the latter being one to nine or 10. With such a considerable quantity of grain is necessary to bring the ratio down to the required standard.

2. THE CARE AND MANAGEMENT OF THE HORSES.—These are just as important as the quality of the feed. No greater mistake is made in the management of stock, than the plan too often adopted on the principle that all that is necessary is that the animals shall be well or liberally fed. Horses that are well cared for and always carefully used will do well on a very ordinary ration; while horses receiving no care and that are carelessly or severely handled will not thrive on the best of feed.

4. THE WORK REQUIRED OF THE HORSES.—The work required of Mr. Terry's horses is moderate, and can be, probably always is, performed at a moderate pace. If the horses were to be driven at a rapid pace on the road, or were required to do continuous hard draft work of any kind, a grain ration would undoubtedly be desirable if not necessary.

Another very important point is the fact that all horses are not adapted to the same kind of treatment. The individuality of Mr. Terry's horses may have much to do with the success of his method of feeding. Some horses are very easily kept, and will do a moderate amount of work, and at the same time, keep fat, on a ration that would barely keep the skin and bones of another horse together. No general ration can be given that will suit all cases. To secure the best results the needs of each individual horse must be carefully noted and his wants supplied. While the method of feeding on clover hay is practicable, and may even be desirable in special cases, it is not suitable for general purposes. It is, moreover, a method requiring much skill to carry it out successfully. A method that proves a success in the hands of one person, is very often a complete failure in those of another.

FROM E. DAVENPORT.

The RURAL asks what I think of Mr. Terry's plan of keeping horses without grain. Briefly, under his circumstances he has shown admirable tact in adapting means to the end in view. He must raise clover. He does not wish to raise corn or oats. His farm is small. He practices intensive agriculture. His teamwork is moderate. He frankly owns that he was desirous of keeping his horses without grain, to save buying it, and he has proved that in his case it can be satisfactorily done. If so, no one should quarrel with him for not wanting to sell good clover hay, buy grain, and pay transportation both ways. But his experience has not proved that the rest of us should sell our oats and buy clover hay; or that, having both, we should not feed both.

Mr. Terry is not a horse breeder. Horses are a necessity with him. His object is to get from them only a moderate amount of work with the least outlay for feed. He finds he can make his clover hay, which he must raise, do his plowing, cultivating, and marketing of potatoes; which, I take it, is his real business at present. What better could he ask? They beat him in China, for they keep asses and mules and feed them on the potato tops; they cannot afford even hay. Horses, like men, must live on what they can get, not on what their fancy may dictate, or their appetite approve. There is a wonderful elasticity about the requirements of the animal body.

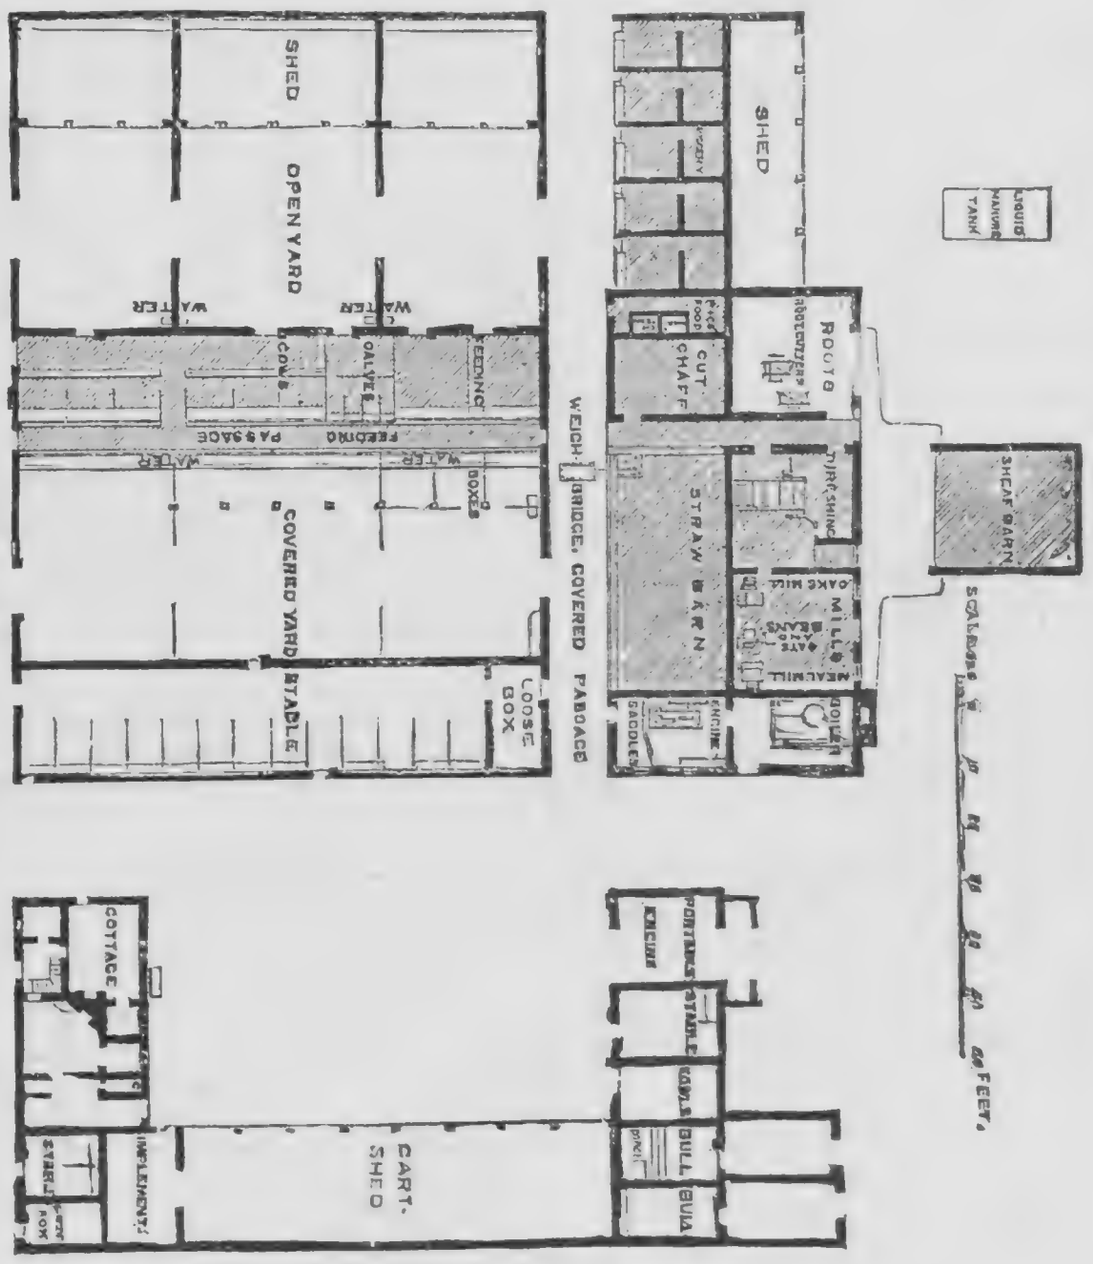
Nor would I be understood to believe that Mr. Terry abuses his horses in feeding no grain. Every farmer must have some kind of animal to consume his coarse products, save transportation, and return the residues to the soil. This is usually done by cattle, sheep and swine. Mr. Terry chooses to make his horses do this, and it does not seem that they suffer thereby. I might remark, in passing, that it is often overlooked that this is the proper office of animals in the economy of the farm, unless the farmer be a breeder, or a dairy farmer, when all else must be subordinated to the well-being of his stock.

We should do Mr. Terry justice. He does not say to every man "Go thou and do likewise;" neither does he say that clover hay alone is the best food, all things considered, nor that it is the best for the horse, nor that more labor can be obtained from a clover-fed horse each day than from one given an allowance of grain. If he should say these things I would say frankly that I do not believe them. They haven't been proved. He is non-committal, and does not assert them. He has proved that he has gained his end successfully. Facts are hard things to theorize away, and no sane man will for a moment question the financial soundness of Mr. Terry's practice under his circumstances.

Milk is a perfect ration for man, and he thrives exceedingly well upon it in his younger days, but for a grown man to perform a full day's labor upon a diet of milk is a physical impossibility. In Belgium, butter-milk is the national diet helped out by potatoes, and supplemented at rare intervals by bits of bacon. There, too, the family cow eats all the weeds of the farm, and horses are not kept at all under "*la petite culture*" of which I am speaking, for there is not enough to be done to pay for their keeping, even on hay. So the cow that eats the weeds, and, perchance the wife that eats the butter-milk—to save it—do the plowing—another shining example of adaptation of means to ends, alongside of which Mr. Terry's is pleasing and luxurious.

On general principles, the horse is not a cow, and is not constructed to live entirely upon the coarsest feed. In his wild state he lives upon grass to be sure, but then native grasses are exceedingly nutritious. As we domesticate him, and keep him for his labor, we tax his energies more severely than nature does. He has not the stomach of the ruminant, and I question if evolution in that direction would be desirable. Hay-fed horses would find labor very arduous on some of our large farms, and in the Michigan lumber woods would undoubtedly prove a failure. It was not that sort of a team that drew 30,068 feet of pine logs at a single load. In general, so far as albuminoids alone are concerned, *good* clover hay is about equal to the same weight of oats; but it contains only half as much of the fats and starches. But one-tenth of oats is crude fiber, while such fiber constitutes one-third of clover hay. Clearly under severe labor and heavy feed, some of the less bulky foods are desirable in order to secure the greatest amount of labor to the 100 pounds of horse. Whether feeding such fodder is cheap or not will depend in every case, as in Mr. Terry's, on circumstances, of which every man must be judge in his own case. Either extreme should be avoided, lest our domesticated horses become grey-hounds upon the one hand or cows upon the other. I shall still feed grain to horses and expect to get more labor from them and with greater comfort to the animals.

Ingham County, Michigan.



AN ENGLISH BARN YARD. Fig. 140.

Architecture.

A QUEEN'S BARN.

ENGLISH sovereigns have always been more or less interested in agriculture. The ruling king or queen has always in modern days made it a point to conduct several farms in different parts of the kingdom, and under different conditions of soil, climate, etc. These farms have been in one sense experiment stations—they have not generally been conducted on a money-making basis, but rather for pleasure and instruction. The following adaptation from Ben Jonson seems to Englishmen very sensible:

"Princes that would their people should do well,
Must at themselves begin, as at the head:
For men, by their example, pattern out
Their imitations, and regard of laws;
A farmer Queen, a world to farming draws."

The present English queen is interested in several farms. One of these, called the Flemish Farm, is the subject of the present sketch. The Flemish Farm received its name from George IV, who established it at Windsor for the purpose of illustrating the Flemish system of farming. It consists of 400 acres of land, of which 160 are in pasture. The soil was originally very poor for general agriculture, being cold and stiff. It has been carefully drained at a cost of $15 per acre, and no expense has been spared to bring it to a high degree of fertility. As a result of this care, it is stated that the farm is made to produce from 36 to 40 bushels of wheat, and from 60 to 80 bushels of oats per acre, and large crops of mangels, clover and beans. Plowing is done entirely by steam. Hereford cattle are kept at the Flemish farm, it being the custom of the royal farmers to keep but one breed of cattle on each farm. The horses are a cross between the Suffolk and Clydesdale.

At Figures 139 and 140 we show the barn plans for this farm. These buildings were erected at a cost of $30,000, and are regarded as the most complete set of farm buildings to be found in England. Fig. 139 shows an end of the main structure; while Fig. 140 shows the plan of the building arrangement. It will be seen that the English believe in having their work well under cover. The drawings are re-engraved from Bell's Weekly Messenger.

A COMPACT HOUSE.

THE house shown at Figures 135, 136, 137, was built by Mr. Richard Cronsberry, one of our Canadian subscribers, from plans designed by himself aided by several ideas he found in the RURAL. The two longest sides are 20 feet; the other six are 13 feet each. The house is built on a stone foundation, walls seven feet in the ground with a wall in the center of the cellar. It is concreted and brick-clad. The cost was $1,500. One great point about it is the number of windows. (w.) As seen in the drawings, there is plenty of chance for sun-light. There are also plenty of closets (c). It is proposed to build a woodshed at the back of the house, so no window was made there.

Farm Economy.

SCUFFLE HOE.

AT FIG. 138 we show a picture of a hoe used by many gardeners. It is intended for shallow work, scraping or slicing. It is very useful for cutting off weeds or grass just below the surface of the ground. The R. N.-Y. is trying a cultivator attachment that works on much the same principle. This is made by G. Hauschild, of Topeka, Kansas. It consists of a narrow cutting-bar about a foot long, so attached to the cultivator teeth that it runs at any depth desired, cutting the weeds off below the surface. We tried it once last year, in stony ground, without the best of success. This year we are to try it in a grassy corn-field that is free from stones.

TRIMMING A GRINDSTONE.

IN the RURAL of March 2 I notice an article from George O. Gilbert showing how to trim up an old grindstone; to this I wish to introduce an amendment.

Inclosed find a rude sketch (see Fig. 134) showing the proper way to proceed with such a job. Instead of making the hole for the crank shaft in the center of the block, find the center of the stone in its present form, mark the point on the block and bore the hole there.

First, draw the line E F across the original center; next a transverse line A D. On this line find the center (from side to side) and make the hole there (at c.) This is the correct center of the stone in its present shape; and from this it can be turned by wasting only one-half as much of it as must be wasted if it were turned in the manner which Mr. Gilbert suggests.

P. H. WAIT.

Field Crops.

NEW WAY OF SHOCKING GRAIN.

IF there is one piece of farm work that the writer feels he knows how to do, it is putting grain into shock rapidly and well, so that it will successfully resist all ordinary accidents of wind and weather to which our crops are exposed. I tried many methods before I found a satisfactory one. This is perfect, and as I never saw any one who had ever heard of it except the man who taught it to me, I want to tell the RURAL readers how it is done. If our wheat had been shocked in this man-

ner all over the State, we should not have heard of the terrible losses of 1882.

Of the 12 bundles that make the shock, select, first, for caps the two longest and best, preferably not very large ones. Next take the two largest and longest and stand them north and south, head to head, with the buts well apart, and settle them firmly together and on the ground. The beginner will not set the buts far enough apart. The bundles should stand at an angle of about 45 degrees with the ground or as flat as may be without falling in; they will never move after they have been left to themselves. Next, with a good bundle in each hand step to the north end of the shock, facing south, and set a pair astride of the buts of the north one of the first pair, rather straight, leaning *slightly* toward the shock, *i. e.* south. Set another pair over the buts of the south bundle of the first pair.

The shock is now long, consisting of three pairs of bundles, the first ranging north and south, and the second and third ranging east and west, one pair astride of the buts of each of the first. This is the essential part of the shock, and with a little practice is so set as to form a lock that stands firmly. A pair against the east and one against the west sides with the caps complete the shock, which will not be round, but will present a well defined ridge running north and south.

To cap this shock, do not break the straws all one way, but part them to the right and left above the band; then with the fingers open the lower side of the but just before placing the cap on, and spread the buts well when in place. The object is to have, not a circular roof, but a long one with two well defined sides, east and west. No man need be afraid to lean against this shock in putting on the caps as it will hold up any ordinary person. Our prevailing winds are from the west and we put the south cap on last. If the shock be properly made there will be a hole entirely through east and west, and every bundle will be visible from the outside.

The advantages of this method are many, and will become appreciated on trial. The shock consists of *pairs* of bundles, and they should be handled in pairs. One or two men can work at it with equal facility. There is no danger while working, of pushing over what is completed. The last four bundles—on the sides—are in no way concerned in the strength of the shock, and may be equal or unequal, good or poor. The first six make the lock, and the two of each pair should be about equal. Even a careless man may help; if the careful man sets up the first pair, and one of the end pairs, the shock will stand in spite of careless work elsewhere. Every one knows in practice that in most methods *every* bundle must be carefully placed, or the shock will be likely to go down.

This plan requires little care when once learned, and I have never had a man who did not readily make good shocks in this way. Since I began to use it, five or six years ago, very few caps have been blown off, and less than half-a-dozen shocks have been blown down. The only fault is that in taking down the shock it must come in the order in which it was built up, as it cannot be readily pushed over with the fork and taken at random. This method is especially good for starting shocks of corn stalks, which are easily blown down. In short, a shock put up in this way, is stronger, presents more drying surface, is more easily made, will resist more bad work and bad weather. Altogether this is the best method I have ever seen. Try it.

E. DAVENPORT.

SWEET CORN FOR CANNING.

THE growing of sweet corn for the canning factory occupies several hundred acres of land in this vicinity, and, in suitable soil with good management it is quite a profitable industry. The factory is owned by a firm which has several other factories in different places. The farmers grow the corn on a contract, made in the spring, specifying how many acres each shall plant; what variety, how it is to be cultivated (that is, the grower agrees to give the crop good cultivation, as corn poorly cultivated, producing many "nubbins," is unprofitable to the canner); how and when it is to be delivered, how weighed, etc., and the price to be paid. This is now 25 cents per bushel, although I think it was formerly 30 cents. The canner furnishes the seed, and takes his pay from the price of the corn at the time of settlement. Growers are not allowed to purchase seed elsewhere, though they may grow their own from seed furnished from the factory if they wish to do so. The corn is generally paid for in January. This is the worst feature of the business, as it compels farmers to wait for their pay until long after the crop is delivered.

Sweet corn succeeds well on almost any soil unless it be a heavy clay, although the best crops, both as to quantity and quality, are grown on the river bottoms and on loamy soils. The land must be well drained. The soil must be fitted about the same as for field corn, and the general culture of the crop is about the same, although the early growth of sweet corn is more slender than that of field corn, and it requires a little more nursing in the earlier stages of its growth. It must not be planted until the ground is warm, or it may rot instead of germinating. It is grown both in hills and drills, the latter method, I think, being preferable, although it necessitates more hand labor. A considerable number of different varieties are grown, though all must have a white cob. For the earliest picking Crosby or Minnesota is planted, followed by Hickox, Old Colony, Asylum, Stowell's Evergreen, Egyptian, Mammoth Sugar, and others. The same varieties succeed differently on different soils. The cultivation is about the same as for field corn, but must be very thorough, as sweet corn will not endure neglect.

The crop is harvested when the corn is in the milk, or in a suitable condition for use on the table. The ears are picked from the stalks, and drawn immediately to the factory. The load is weighed; sufficient corn, taken at random from the load, to make a bushel of husked ears, is husked, and weighed together with the husks removed from it. This is the weight of a bushel, and varies from 50 to 70 pounds. The net weight of the load divided by this, gives the number of bushels, for which the grower receives a receipt. Sometimes the field is picked over twice; sometimes but once. The stalks are cut as soon as the corn is removed, set up in medium sized shocks, and cured as thoroughly as possible before being put into the stack or mow.

This is a very difficult part of the work, as the stalks contain so much sugar that they are very liable to heat and spoil after being stored. It seems to me that the silo will prove a great blessing to growers of sweet corn. The stalks are more valuable for feeding than those of field corn, but the difficulty is to get them properly cured. The yield of sweet corn varies much with the soil, season and culture. I have no figures at hand, but from observation, I should say an average crop is about 100 bushels per acre, or, perhaps, a little less. One field of five acres under my observation the past season produced 800 bushels, or 160 bushels per acre. F. H.

Clyde, N. Y.

Rural Topics.

PROTECTIVE COVERINGS AMONG PLANTS.

PROF. BYRON D. HALSTEAD.

Functions of the skin, rind, fuzz, and prickles of fruit, and of the epidermis of leaves as well as of the bark of trees and other plants; microscopic breathing pores of leaves; the cambium; "hide-bound" trees; rootlets, their function and protection.

PLANTS, like other living things, need to have their tender or so-called vital parts well protected. We seldom think of this, but it is not difficult to be impressed with the fact as soon as attention is called to the matter. Take any fruit you please and the first thing that is met with is a skin of greater or less thickness. This skin may be so thick that it must be removed before the soft parts within can be used upon the table. This is the whole explanation of the peeling of apples, pears, peaches, cucumbers, etc. This skin, or epidermis, in some fruits is very thin and may be eaten, especially in case of the smaller fruits. Thus no one would stop to remove it from a currant or cherry, and, least of all, from a strawberry. Sometimes, in addition to a thick, tough layer, fruits are covered with a coat of short hairs or fuzz, as in the peach and allied fruits. Others have, besides the thick skin, a number of prickles which in some instances, as in the wild gooseberries, are so sharp and stiff as to make the gathering of the fruit a disagreeable process. Other fruits have a bitter or otherwise unpleasant rind that needs to be removed before the inner parts can be utilized. These outer layers of tissue serve a double purpose, namely, that of inclosing and holding in place the soft interior part that would otherwise be destroyed by the elements, or by birds and other animals. This is particularly true of the fruits because the parts within, named the seeds, are of more than ordinary importance.

The seeds are not the only portions of a plant that need protection. Over every part that is exposed there is some sort of a covering developed which wards off enemies and gives form and solidity to the portion that is inclosed. Take the leaf, for example, and the epidermis is not the least important of all the structures. This is a thin, firm, usually colorless layer which extends over every part, whether it be the veins, midrib or the softer portions between the frame-work. Upon the outside of the epidermal layer is a film of gummy substance impervious to water, that serves to keep the parts within from suffering from excess of moisture. Through this envelop of cutin or cuticle and the epidermis below are innumerable small holes called breathing pores, so small as not to be seen except with a microscope. These pores are like delicate valves and are so adjusted that they open or close according to the surrounding conditions. It is through these pores that the water of the plant, in large part, passes out. Tons of water are given off by an acre of growing corn in a single July day.

The stems are protected, and as these parts of a tree, for example, remain for a long time, while leaves, as a rule, last for only a single season, and the stems are more subject to injury from their proximity to the earth, they are usually well protected by a thick layer commonly called bark. This bark is a complex substance which usually is found to consist of layers one over another and all outside of but close to the cambium. By cambium is understood that zone of tender substance easily destroyed and from which the new layers of wood are formed upon its inner side, while the bark is renewed from its outside as fast as more bark is needed to insure the proper protection of the soft and delicate lining cambium within. When the boy makes a whistle out of a willow or other twig he separates the bark from the wood upon the layer we have been speaking of named the cambium.

This bark varies greatly in thickness and texture, depending upon the age of the stem. In short, the older the stem, the thicker this bark, unless it should fall away in great strips from the outside as is true in the shag-bark hickory and many other trees, and better illustrations may be found in the grape vine which is almost always casting its bark. The protective layer of bark sometimes binds the growing parts within so that the horticulturist often finds it to his interest to slit the bark longitudinally upon his "hide-bound" trees.

The young twigs have at first no true bark and are covered, as are the leaves, with an epidermis. As time passes the bark begins to develop and in place of the then green epidermis there is a bark which upon the outside may be brown or gray—in short, of almost any color except green—and covered by a thin, shining layer that is like the cuticle and made up of a gummy substance. Upon a large tree the whole development from a green epidermis upon a young twig to the thick, dead bark upon the body or main stem, may be seen. It may be said, in passing, that when the bark is accidentally removed from a small portion of a tree, there will form a new bark, which process is known as the healing over of the wound. This very fact of the rapid replenishing of the protective layer is one of the best illustrations of the importance of this substance.

Coming now to the root, the case is somewhat different, because the roots and especially the younger ones perform a particular office in the economy of the plant which demands that they shall be free from bark or epidermis so-called. There is a hand-to-hand conflict, so to speak, going on under the earth, and the hands cannot be gloved. It is the peculiar function of the younger roots to do the work of absorbing the nourishment that the plant must obtain from the soil. This work requires that the delicate fibrils, and still more slender root-hairs borne by the rootlets, shall come in direct contact with the soil-particles and the soil-water that is held, sometimes quite firmly, by the small masses of earth. It therefore follows that the young roots, which perform nearly all the work of absorption, are uncovered save by the soil, among the particles of which they insinuate themselves. Their best protection, which of course includes the best conditions for the life of the plant, is when they are not covered with an impervious layer such as that spread over the stems and leaves.

But there is a portion of every young, tender rootlet, no matter how small, that is protected by an outgrowth not unlike that which forms upon the bud. In other words, the tip, which is not employed in absorbing nourishment, is covered with a cap which surrounds the youngest and most tender of all portions of the root, called the growing point. At this point the root elongates and the cap is pushed before this place as the root grows through the earth, and prevents the sharp particles of soil from injuring the most susceptible tissue. Farther back upon the root at a place where it has become woody and can no longer take an active part in absorbing liquids from the soil, there is a rind formed and this may be quite thick upon old roots that only serve as a mechanical support to the plant, and conduct the liquids from its younger branches to the stem and leaves above.

Rutgers College, N. J.

The Poultry Yard.

A PLEA FOR THE CHICKENS.

I HAVE often wondered why it is that housekeepers in the country raise so few chickens. Taking care of them, of course, requires considerable time; but if by devoting two hours each day for three or four months one can furnish a table with delicate, wholesome meat and an abundance of fresh eggs for the remainder of the year, it seems to me that the time is most profitably spent. Very little expenditure, too, is required for their accommodation: in this latitude the roughest of wooden houses will afford them protection from the snow and rain in winter, while in summer they thrive best out-of-doors provided the owls and thieves are not too numerous in their vicinity, and scattered about every farm-yard one can pick up loose boards which an ordinary farm hand can fashion into coop that will serve to shelter the little chickens from spring rains and keep them from running out in the morning dews. Neither is their food an expensive item; the cold victuals left from the table (which are usually thrown out to a crowd of worthless dogs) together with the bran sifted from the meal will serve for their food while small, and after that they can almost get their own living where the range is large and they have access to the orchard and eat the defective fruit as fast as it falls to the ground. This is a great advantage to the fruit trees as well, for the insects which cause the fruit to fall are thus destroyed before propagation takes place.

It is the best plan, however, to give the half-grown fowls a light meal night and morning so as to keep them in good order and ready for the table. If they are obliged to forage for their living entirely, though they are sure to be healthy, they are apt to grow up very slender and long-legged. Then, too, every housekeeper knows what a help it is to have her chickens gentle, so that when company drops in unexpectedly one of the children can slip out and by throwing down a handful of food pick up a pair of nice fat fowls. There is nothing quite so ridiculous as to see a crowd of white children and little negroes chasing an active young cockerel over the yard, and to hear its despairing squawk when at last it is caught, most probably under the front porch where the visitors are sitting. The visitors almost wish they had stayed at home, if they are going to put their hostess to all that trouble, and she is filled with mortification; but what alternative has she? There is no convenient grocery store just around the corner to which one of the children or a servant can be secretly dispatched; and in the country visitors do not call between meals and leave when Bridget rings the dinner bell.

There is nothing that will take the place of poultry; it is always ready; the most wholesome dish a mother can set before her children is stewed chicken, cooked with a few Irish potatoes sliced thin, and seasoned with cream and fresh butter. Who does not remember the deliciousness of the first chicken-pie of the season, and if you want to see a man's eyes shine just set before him a dish of crisp fried chicken. I know one who never tires of it. And the eggs, too, how the children do love them—like is not nearly strong enough to express their affection—love is the word. If you want to make little boys happy in cold weather, just give them some eggs to roast. Likely as not the eggs will pop open in the fire and ashes will get mixed with the yelks, but that doesn't matter, not a particle will be lost.

For an invalid there is nothing so tempting as chicken broth; it is much more palatable than the various extracts of meat, beef juice, and koumiss, that one gets out of a drug store, and which to my thinking are exceedingly trying even to a well stomach. And yet how few families among the poorer people, or even those in moderate circumstances, have a bountiful supply of poultry. How often have I seen little children sit down to a meal of salt bacon and soda biscuit. No wonder their little faces are sallow and peaked, while the father complains of enormous doctor's bills. But if you ask the mother why she didn't raise more chickens this year, 10 to one she

will say it was her husband's fault; either he would keep the brood sows in the lot next the house, or she could not get coops made tight enough to keep out the vermin, or something or other happened to them that a man of average intelligence might have prevented.

Women in the country are not lazy as a general rule; on the contrary, they do more work in proportion to their strength than the men, who among the lower classes are very remiss in providing conveniences for their households. This has been the case for so long that the women have accepted it as fate, or rather, they put it down to what they call luck. Their constant complaint is that they have had "bad luck with the chickens They could seem to raise hardly any at all. The young ones were weakly and slept themselves to death; or they grew off right peart for awhile, then got puny all at once and died. Mighty bad year for chickens."

When I hear them talk that way, I always feel like telling them "luck" has nothing at all to do with it; there is no such thing as luck. What they call bad luck is bad management, and good luck is good management. There is a cause for every effect. If the young chickens are weak and delicate at first the parent stock has degenerated, and when they grow off thriftily for a while and then droop and die it shows there is bad management somewhere. Perhaps they are infested with parasites or do not have access to pure water and are not properly fed. The fowls themselves are not to blame; no little creature comes into the world with a more fixed determination to live, or is more energetic in searching for its daily bread than a young chicken. Chickens are much less finical in regard to their food than young turkeys, and their instinct for self-preservation is much greater.

Young chickens in the spring would be very much healthier if the parent stock were brought through the winter in better condition. When they are allowed to roost in the trees during the severely cold weather, roup is likely to show itself in the spring, and this disease proves fatal not only to the grown fowls but to the young ones also for months afterwards, either through inheritance or because of their surroundings becoming contaminated. During the memorable sleet last winter, the fowls hereabouts stayed out in the trees for a whole week, in a half starved and half-frozen condition. And after every bitter spell of weather my neighbors tell how their fowls froze to death, as if it were something very much to be wondered at. Even the hens that survive are very poor, beginning to lay late in the season, and of course are still later in sitting.

A FARMER'S DAUGHTER.

Everywhere.

COMMENCING IN THE TIMBER.

The real-estate man of the beautiful prairie regions of the West delights in presenting to his readers on his cards, in folders, pamphlets, 16-page editions of the booming newspaper of his booming town, side by side pictures of the start in the woods and on the prairies, and a view of the enormous improvements five years afterwards. This is not the view to which I wish to call attention. To one who has always lived on the prairie where almost the first thing thought of is to start shade trees about the buildings or the proposed site for them, there are some things hardly explainable in the conduct of a large majority of those who make their start in the timber. The primeval trees growing near the proposed site are almost invariably cut down before the buildings are erected, and in the rare cases when they are allowed to stand for a time they are in course of a few years cut down for wood and the yard is left bare of shade. Protection from wind and storm is not needed at first, but as field after field is cleared out, the timber belt recedes and the storms and winds are felt almost as keenly as in the prairie sections.

Allow me to offer these suggestions: If shade and protection are wanted at all, allow a sufficient number of the most shapely trees to remain standing to afford plenty of shade, cutting and training such limbs or unsightly portions as may be necessary, in order to enhance their natural beauty.

If other varieties are eventually wanted, they can be planted among the old sorts, and as the trees become crowded some of the original ones can be removed as it may be found necessary to do so. For protection, leave a thick belt of timber on the windward side of the buildings and you have at once what a prairie farmer will spend time, care and money for a dozen or more years to secure. But how often in timber regions do we see buildings without a single wind-break nearer than the timber outside the fields. When you are making the first clearings, draw, at least in imagination, plans of the future farm with its pasture field and feed lots, and in these places allow a few trees to remain standing and years hence you will be rewarded by the greater comfort of your stock, and the greater beauty of your surroundings. You will be surprised at the beauty and utility of those trees some day; for growing somewhat isolated, they will become more symmetrical. Of course, the garden and orchard should be close to the house and there the clearing should be complete; but these can be on the side where shade and protection are not needed, and a fringe of timber even here will do no harm; while in some exposures it will be an advantage.

So far as my observation goes, when the clearing commences it should be a complete work, still though in a hurry to get as much land under cultivation as possible, it may possibly be advisable to allow the large trees to remain standing simply "deadening" them for the time; but the damage to crops from shade and fallings limbs makes this doubtful. Where, in a country like this, the timber has but little market value except as needed on the farm for lumber, rails, or wood, let everything be taken "clean as you go," and let the land be put into cultivation the same year. I notice many going through their timber cutting here and there for wood, etc., and if this cutting were done in one place it would add quite considerably to their cleared fields, while as it is, wherever a tree or brush is cut unless the land is put into cultivation at once, innumerable other saplings and brush growth spring up, making the future work much harder.

Occasionally one sees a farm house around which Nature has been allowed to retain much of her natural forms, and with a little artificial work, how soon can a home-like appearance be given to the group of buildings which forms the center of the picture.

Christian County, Mo. J. M. K.

EXTRACT FROM AN ENGLISH LETTER TO A COUNTRY GIRL IN VIRGINIA.

I AM much pleased with the copies of "the RURAL NEW-YORKER" you have been sending me, and interested in the talks upon the "Dark Side of Farm Life" and also with those on the "Bright Side." Such a paper can not fail to do good. You American farmers have more of sunshine than shadow. What lives you live and might live! English farming differs so much from American that my envious eyes are turned toward your shores rather than towards the green valleys and fertile meadows of my own native island. Our soil is very productive; the average yield of wheat per acre is very considerably more than that of the United States, and it grows thicker than it does in America and the grains are very plump and heavy. We can also grow good oats and splendid grasses—very fine, tender and rich. Corn we cannot grow; the climate is not warm enough; but many vegetables, such as turnips, potatoes, etc., do very well as a rule. Still I should much prefer the American farmer's lot. The difference is chiefly caused by the difference in the value of land, and the conditions under which it is held. The land here is largely in the possession of comparatively few, in whose families it has been handed down from time immemorial. It is almost an article of their creed not to sell any, and, in fact, in many cases they have not the power to sell it, it having been left by some remote owner under an abominable old law, called the law of entail, by which the estate is vested in the eldest male of the family, and passes down from father to son, and to son again and so on for generations, each owner in turn being only a life tenant. These large estates are subdivided into farms which are let to the farmers, always for cash rent. There is no such thing as paying rent with produce in this country, and land is so highly valued here that the annual rent is considerably more than good land can be bought for in America.

Our seasons are uncertain, and often unfavorable; but, of course, the rent falls due whether the crop is good or bad, whether it is safely gathered in or rotting in the soddened field. In America, you have such a vast area of land as compared with the population, that it is comparatively low in price, and can be bought and sold with the utmost facility. You have, as a rule, favorable seasons; if one thing does not flourish, another does, and there is (as a rule) no rent to pay, and though the American farmer does not have as heavy crops as ours, he has more of them and consequently has the advantage all around. These advantages of the American farmer again, have this result; with his vast plains, the absence of rent-paying, and the more favorable seasons he can produce vast quantities of wheat at a low price. This wheat which is imported here by millions of bushels, can be and is sold at so low a price that the English farmer, who of course, cannot get more for his wheat or only a little more than foreign wheat brings, has scarcely any profit whatever, often indeed incurring an actual loss. From this cause thousands of acres which were formerly devoted to wheat growing have been turned into grass land.

So great and severe is the depression in agriculture here, that many, very many farms in some parts of the country have gone entirely out of cultivation, there being no tenants for them. This is a very sad state of things, and it is difficult to say what is to be the remedy. Some would have a tax put on foreign cereals, as there used to be in days gone by. The immediate consequence would doubtless be to increase the price of English and foreign wheat together here. So far the English farmer would be benefited, but what about the millions of working people of this country, who would as another consequence, have to pay more for their bread? The problem is a very grave one and I do not presume to offer a solution of it off hand, and I greatly fear that no solution is possible, which shall restore prosperity to English agriculture.

We cannot alter our climate; we cannot abolish competition with American, Indian, and Russian wheats—it would be a woeful day for us if we could and did. Much advantage might result from a thorough reform of our land laws, but we are a cautious people; we move very carefully in matters of real reform. I sometimes think the more urgently the reform is needed the more cautious we are. But it is not so easy as it may seem to out-siders to change laws and customs which have become interwoven into the whole texture of a nation's life by long, gray centuries of use and habit.

Americans will find many more things difficult to deal with, say, a thousand years hence than they find now. But as things are, and will be throughout my time and yours, how enviable is the lot of the intelligent, industrious American farmer! What a life of healthful exercise, of wholesome activity, of peaceful rest, of plenty (not necessarily rude) of opportunities for self-culture as well as of agriculture.

Ah, that I had stayed and hewed me a home out of those woods somewhere! How it all comes back to me! Listen how I can picture it! I see the substantial brick house, or the trim neatly painted frame one, or what do I care if it be the hewn log house? There is plenty of room in it, plenty of everything in it. I hear the sound of happy voices through the open window, against which nods a fruit-laden bough or the fragrant tress of a climbing rose.

A little distance away is the well-filled corn crib and the spacious barn, the smoke-house and its savory store and the stables over yonder where the good horses are housed. In front of the house stretch acres on acres of meadow, down to the stream, where the cows are standing knee deep in the cool water. Over there to the right is a billowy expanse of yellow wheat smiling at the sun, and here, to the left, a green ocean of corn blades, glossy and bright as they wave their silken banners in the breeze. Further away still rise the shadowy woods; the silvery beech, or gnarled sycamore, the straight-stemmed hickory, the ribbed ash, the spreading oak, the towering pine.

Hark, there goes a squirrel rattling up that huge sycamore with nimble feet to his aerial perch, and somewhere overhead I can hear the tapping of the woodpecker, and over all the drowsy hum and chirp of myriad winged creatures, basking their little lives out in the cheerful sunshine. By and by those woods will blaze in the gold and crimson of their autumn glory; the corn blades will hang dry and sere, and the golden ears will peep out from the bursting shucks. A drove of hogs will be fattening over there in the paddock, while turkeys stalk solemnly about the house, in blissful ignorance of all such fatal epochs as Thanksgiving Day or Christmas. The hickory nuts will be ripe and the thorny-hulled chestnut, and the young people will be emulating the squirrels, laying up their store for the winter.

And the long winter evenings by the glowing ash or hickory fire, with the basket of nuts and apples at hand; or the corn-popper hard at work, while the merry story and cheerful laugh go round the happy circle. Oh, for the fragrant soil, as the springtime plowing upturns it! Oh for the young and tender blades of the springing corn; for the yellowing wheat waving in the hot July sun! Oh, for the golden fields of autumn, for the homely joys of winter, all the dear life of the farmer in that dear, dear land!

Ah, how my heart turns to it again and yet again; swifter than the electric message that flashes in a moment from the Old World to the New, my love and longing fly to that far-off shore, hallowed to me by a thousand sacred memories.

Those who have lived the easy country life will find it difficult to understand very clearly the position of the working classes in this country, and of many in the United States. It is true that every condition of life has struggles to pass through, and the farmer has his, too, and often knows what it is to wish that things were a little different. Especially is this so since you have put away the old-time manner of living. Our boys and girls must be sent to college, and a great many other wants are creeping in, and there is often a call for more ready money than the farm can bring. But compare the lot of even the most humble farmer with that of innumerable thousands in this country and of many in your own land.

You have the old home and the farm; you own it outright; you do not have to pay rent to any one for the roof over your head or the fields you till. And those fields under God's bright sun and sweet warm rains, produce your food, and perhaps even your clothing, too, or that which brings it. The trees yield their fruits for you, the garden gives its part, you have cows in the pasture, chickens, turkeys, and what not in the yard, plenty all around you. If the owners, the tillers of those fields wish now and then for a little leisure, to pay a little visit or to have some little excursion, they can take it; the corn and wheat grow on; the sun and rain play their beneficent part, and when the harvest time comes, then all is yours, the fruit of the field, and flock and herd. And though money, in actual coin or bills, be sometimes not abundant; what then? You can still live, the home is still your own, the living is sure. I have pictured in the merest outline the lives of thousands of American families who ought to thank God every day of their lives that "their lines have fallen in such pleasant places and they have so goodly a heritage."

Now, try to imagine the position of millions in this country, and many in your own United States lead much the same life. Imagine the difference; they have just so many shillings, or we will say dollars per week, a fixed, unvarying sum. If kept at home for a day or two once in a while by illness there is no loss of salary, nor when working late hours, as at some times in the year often happens, is there any extra pay. This weekly amount is all there is for everything. The houses they live in are not their own, they pay a high rent to the owner. They have no fields, no flocks of sheep, no cattle, no poultry, no fruit trees, large or small. Every particle of food, flour, butter, sugar—every drop of milk, every egg, clothing, coals, gas-light everything must come out of this one weekly sum. Everything had to be labored for, so much work for so many shillings, and so many comforts or necessaries for these shillings. But if that work should cease for even a week, the income ceases; there is no background of fertile fields and sunshine and showers to work for them, nothing but their daily industry.

I say it with the fullest conviction, after years of struggle in that land and in this, that the American farmer who is industrious, intelligent, persevering, is one of the most favored of men; his lot is, or should be, one of peace and comfort, and if there be such a thing as envy in my heart, there is no man I envy so much. C. BOOTH.

THE FARMERS' CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

VALUE OF FERTILIZERS.

P. G., Oswego Falls, N. Y.—What is the fertilizing value of hen manure per bushel, of hardwood Canada ashes per ton, and of stable manure per two-horse load delivered? The fertilizer is to be used for strawberries on a light sandy soil.

ANSWERED BY PROF. H. H. WING.

Nitrogen, phosphoric acid and potash, in the form of commercial fertilizers, are worth in the market about 17, seven and four cents per pound respectively. For practical purposes we may assume that they are

Miscellaneous Advertising.

"Herbrand" Fifth Wheel for Buggies.

worth the same prices in hard-wood ashes, hen manure and stable manure. These articles are, of course, very variable in composition and it is out of the question to give a definite answer without knowing the analysis of the sample in question. A ton of hen manure of good quality should contain about 33 pounds of nitrogen, 31 pounds of phosphoric acid and 17 pounds of potash; these together would be worth $8.38 at the prices given above. Knowing the weight per bushel of the hen manure our inquirer can very easily tell what he should pay for it. In the same way a ton of fresh farm yard manure, likewise of good quality, would contain about nine pounds of nitrogen, four pounds of phosphoric acid and 10½ pounds of potash, worth, all together, $2.24. Good Canada hard-wood ashes should contain per ton 200 pounds of potash and 130 pounds of phosphoric acid, worth together $17.19. Of course, if the ashes have been leached or the manure has been "fire-fanged" or exposed to the weather, the value will be materially decreased, but how much it would take a chemical analysis to determine.

WEIGHTS OF CLUSTERS OF GRAPES.

J. P. K., Wakefield, Kan.—What was the weight of the largest bunch of grapes ever raised in America, England or any other country?

ANSWERED BY GEORGE W. CAMPBELL.

I am not able to answer these questions very satisfactorily, and can only give reports from sources which are probably reliable. If J. P. K. wishes to know the weight of native grapes grown in America, including hybrid varieties of American production, I would say that with ordinary good culture, they are not often grown over a pound to the cluster; from one half to three fourths of a pound being a good average of the larger varieties, while the smaller ones would average less. Concords, Niagaras, Pocklington, Duchess, Downing, and Triumph, have been grown as heavy as one and one-fourth, to one and a-half pound; and the Highland grape, one of Mr. Ricketts's hybrids is reported as having been grown to weigh two pounds and two ounces. In England a bunch of the Black Hamburgh is reported to have been grown by special culture, for exhibition, and shown at the London Horticultural Society's exhibit, weighing eight pounds and six ounces. The Syrian or Palestine grape, which is believed to be the variety mentioned in the Book of Numbers as having been found by the Israelites near the brook Eshcol, and which was borne upon a staff by two men, is reported to have borne clusters in England weighing 19½ pounds; and in its native country as high as 25 pounds. So far as known to the writer, this is the largest grape-story on record.

ABOUT PARROTS.

Subscriber, (No Address.)—Where can I obtain a talking parrot and what is the usual price for one?

ANS.—Parrots are imported from Mexico and the West Indies. The Mexican parrots are considered the best. They are imported chiefly during May, while the Cuban parrots are not brought here until later in the season. The young Mexican parrots are worth from $12 to $15 each, while Cuban parrots may be obtained as low as $5 each. Talking parrots have no fixed value. The price depends upon the extent and character of their education. A really good talker, free from bad habits such as stealing, swearing and the like, would be cheaper at $50 than the average parrot at $15. Judging from our own experience, we should hesitate about bringing the average parrot into the family unless it spoke in its native Spanish or some other foreign language. It is apt to get up unpleasant surprises both by its tricks and its language. The best way is to buy a young Mexican parrot and educate it yourself. Louis Riche, 24 North William St., N. Y., or the Associated Fanciers, Philadelphia, Pa., will send you birds which will be all they are represented to be.

FALL-PLANTED POTATOES.

W. O. F., Greensburg, Ind.—In the spring of 1888 I bought a barrel of "high-bred" seed potatoes which I planted with very satisfactory results. Intending to follow the plan of raising a second crop, on leaving home on the latter part of July, I left directions for planting some of the first crop. My man prepared the ground well and trenched according to the RURAL'S plan and planted the potatoes immediately after digging them. Very few sprouted last fall, but this spring they are coming up splendidly, hardly one being missing. If they had been matured by exposure to the air for a few days, would they have grown right off?

ANS.—Yes, no doubt they would. The R. N.-Y. has planted potatoes in the fall and covered them with a sufficient mulch to protect them against frost. The crop was earlier than if they had been planted in the spring. The past winter has been so mild that we might have planted our potatoes in trenches last fall without a mulch.

"WHITE HOUSE" PAINT.

J. J. A., Montgomery County, Ky.—The following is the recipe for a paint or white-wash similar to that on one end of the White House at Washington: Take one-half bushel of good unslaked lime; slake it with boiling water (cover during the process to keep in the steam) strain the liquid through a sieve and add to it a peck of salt dissolved in warm water, three pounds of ground rice boiled to a thin paste. Stir in, boiling hot, one-half pound of Spanish whiting, one pound of white glue, and five gallons of hot water. Let the mixture stand a few days covered from dust, and apply hot with a white-wash brush. If a different color be desired, Spanish brown, yellow ocher or other colors may be added. Do not add green. This makes a cheap, durable paint for all kinds of out-door woodwork, brick or stone.

Miscellaneous.

P. G., Oswego Falls, N. Y.—How can I get rid of wood-chucks?

ANS.—Wood-chucks may be readily shot with a long-range rifle, or trapped with strong-springed steel traps. Dogs may also be trained to hunt them. We know of no wholesale method of extermination.

E. F. D., Lima, N. Y.—How much potash available as plant food is there in one ton of hard-wood ashes?

ANS.—Unleached hard-wood ashes should contain five to six per cent. of potash, which would give about 100 pounds in one ton of ashes. Many will not contain one-half this amount, however.

N. G. P., Malone, N. Y.—It is not necessary to fill your silo to the very top in order to preserve the silage. Half-filled silos have been known to succeed when the covering was perfect. The proportion of failures where whole stalks are used seems to be greater than when the stalks are cut. It is not necessary that the barn should be specially warm in order to save the silage. A tight, well-made, wooden silo will preserve the silage in any ordinary barn.

J. H. McC., Wrightsville, Pa.—What are the fertilizing value and composition of flue ashes taken from the boilers of a blast furnace?

ANS.—We do not know of any analysis of flue ashes, but we do not see how they can have any considerable fertilizing value. They would be likely to consist chiefly of fine coal ashes and soot. The latter might contain a trace of nitrates, but probably the chief benefit derived from its use comes from some favorable action upon the physical conditions of the soil, making it possibly more retentive of moisture.

DISCUSSION.

CITY AND COUNTRY.

FRANKLIN DYE, TRENTON, N. J.—Life, as it relates to those who obtain employment on farms in contrast with that of those who secure positions in town, to which attention is called by Fred Grundy on page 311, is worthy of still further illustration.

Single men who on the farm receive $12 to $15 per month and board, would not command more than $10 per week in town. This would give them $40 per month. Deduct the cost of board and washing and only $13 per month are left. But we must include in this calculation the numerous temptations to expend money that exist in the city and which do not exist in the country; and unless a city man sets his face like a flint against these, he will not be able to resist the inroads they make upon his earnings, and the temptations to moral ruin are correspondingly greater in the city. Moreover, the class of farm hands who have families are able to command $25 to $30 per month, with a house, a garden and other things that a deserving hand frequently receives from a liberal employer; now, how many of this class would command over $25 per week in town or $100 per month? From this each man must deduct $10 per month for house rent, board for himself, wife, and, say, three children, at $3 a week, making $15 a week, which, with the rent equals $75 per month. Subtract this from $100 and $25 per month are left, and the same temptations to spend money unnecessarily exist with him and family as in the case of the single man.

[Not one man of the kind in 100 could get $100 or $75 a month in the city. Eds.]

Then again, we must take into account two other factors which are apt to do away at any time with all the savings the city worker may have made for years from his larger wages—namely strikes among working-men, and compulsory idleness consequent on the failure of his employer.

This state of things never occurs on the farm. Farming always goes on whether for little or much in the way of profits. A living at least is always assured.

The tendency among farmers, country-working men, and farmers' sons and daughters, has been for some time town-ward. In justice to those who, though still in the country, are looking hopefully forward to the time when they, too, can secure positions in town, a word of caution should be spoken. An old adage says "All is not gold that glitters." To those who must work labor is as honorable in the country as in the city. Externals do not make the man; nor do they ennoble labor. A man's character and worth should not be estimated by the clothes he wears, nor by the business he follows, if it is a legitimate one, whether in country or town. The farmer's son is just as honorable and is as honorably employed when taking a load of hay to town and carting a load of manure home to enrich the farm, as he would be if standing behind the merchant's counter measuring dry-goods, and the prospect of setting up in business for himself is as 100 to one in favor of the worker on the farm, at the present low-price of farms, compared with the chances before the clerk. A man advertised a few days ago for a place as clerk in a dry-goods store, in a town of 60,000 inhabitants. His "ad" was answered, and the largest firm in that city offered him $3.50 per week, and he had a wife to keep also. The prospect is not encouraging at this time for green-hands in any city work. There are unmistakable signs of a change. Those farmers, with their sons and daughters, who stick to the farm now, and keep on improving their soil and their methods, will reap the first and largest harvests when better prices for farm produce come. A word also concerning the girls: Why is it considered more respectable on the part of our country girls—and city girls, too, for that matter—to work as clerks on a pittance of a salary, rather than to do general house-work in respectable families, in town or in country? Positions are not numerous enough for the applicants in the former; while in the latter there is a large and growing demand, and the supply is not at all adequate to meet it.

VALUE OF DROPPINGS.

P. H. JACOBS, HAMMONTON, N. J.—Poultry droppings applied to the soil may prove to be no better than so much dry dirt. They are used every season by gardeners who expect great results, and who are disappointed. Now, poultry droppings, like night-soil, are not nearly so valuable as they are estimated, and it is a mistake to suppose them equal to guano, or even nearly as good. It is well known that night-soil is produced from all kinds of food, meat included, the urine being also added, yet it fails to reach a high value when analyzed, a matter which has surprised many. Poultry droppings may be placed alongside of night-soil. They are rich in fertilizing elements, but what becomes of the elements when the droppings are applied to the soil? I have spread droppings three inches thick on a plot of ground, only to find that the crop on an adjoining plot, on which only one quart of guano had been applied so largely exceeded that on the hen-manured plot as to make a marked contrast. I had not kept the droppings properly. The adoption of the frequent recommendation that droppings be kept dry (I am guilty myself of having given this advice) has resulted in loss. I know of no absorbent material that will prevent loss of the ammonia, (plaster not excepted) if the droppings are kept dry. When you rake up a lot of fresh, moist droppings, and mix them with earth, in a short time the whole mass is dry, with lumps as hard as stones, and not a trace of ammonia can be detected. When the moisture left it carried away the ammonia, leaving only that portion which may have assisted in forming a salt, but which is very little. When plaster is used there is a series of changes, and not a direct formation of sulphate of ammonia, as many suppose; carbonate of ammonia and carbonate of lime are some of the results, the formation of which I will not explain here, but the ammonia finally takes flight.

Some time ago I explained to the readers of the R. N.-Y. how the droppings should be kept, but as some of them may not have preserved that issue I will repeat it here and also for the benefit of new readers. Instead of keeping the droppings dry, keep them *wet*, and in so doing you can render them more available as plant food. Have a place for them, such as a covered box, or small out-building. On the floor of this throw a foot or more of earth. Clean out the poultry house two or three times a week, so as to prevent the loss of moisture already in the droppings, and place the latter on the dirt. Over them throw two inches of earth, then more droppings, and continue alternately until the receptacle is full. You may, if you can do so, add night-soil, urine, or anything else. Now simply keep the mass damp, (not too wet) with soap-suds saved on wash days. Never let the mass become dry. The soap-suds will cause a chemical change, the fat acids fixing the ammonia, (or assisting to do so) and when the time comes to use the manure the ammoniacal odor will convince you that the elements are there. The moisture prevents loss of volatile matter, and there will be no lumps to grind and the whole will be in a soluble condition ready for plant food.

Perhaps some one may suppose that I am trying to upset another theory, but the above is the result of a fair comparison of the *wet* and the *dry*. The former recommendation "keep the droppings dry," was simply founded on a theory, after all, and it requires not even an experiment to disprove its correctness, as it is well known that a dry process does not prevent loss of ammonia, and that moisture favors the formation of chemical salts. Allow the stable manure to dry as hard as the lumps in the droppings of poultry, try it on crops, and the loss of valuable plant feeding material can be almost measured by the comparison.

HOW TO PREVENT "BUTTER NOT COMING."

J. H. A., RANDOLPH, CATTARAUGUS COUNTY, N. Y.—I noticed in a late RURAL some inquiry as to "butter not coming." I have seen much in regard to this trouble, but experience has taught me that a high temperature will obviate it. I have raised the temperature of the cream as high as 80 degrees and even 85 degrees; but there must be no guess-work; let the thermometer be the guide. When the butter shows signs of coming, cool the cream back to 60 or 62 degrees. I have never lost a churning owing to the butter coming soft or to any injury to the grain. It has always been as solid and firm in texture as though the high temperature had not been resorted to. I have a Moseley creamer and churn, and use hot and cold water direct to make the changes.

I churn every second day, ripen my cream in a large can, do not stir it any except by turning in with the rest the mess from each milking, keep it closely covered in a temperature sufficiently warm to make it slightly acid—about 62 degrees. My butter is sold to private families at good living prices.

FEEDING ONIONS TO STOCK.

H. B. S., ROCKPORT, OHIO.—Several years ago I raised a crop of onions and the price was so low in the fall that it was thought best to store them until spring. But instead of the price advancing toward spring, it went down until it was far below the cost of raising the crop. There was a flock of 25 yearling lambs on the farm, and the experiment of teaching them to eat onions was tried. While the ground was yet frozen, and snow covered it the feeding commenced. At first the lambs did not seem to care for the onions and would walk away from them, but soon they got so fond of them that the 25 would eat a bushel a day. It was thought at the time of the experiment that the feeding value of onions was about the same as that of carrots or parsnips. Thousands of bushels of onions have been thrown away this spring, the price being so low that they were not carried to market where they would have brought only 10, 15 or 20 cents per bushel.

THE EFFECT OF LATITUDE ON THE EARLINESS OF CORN.

J. J. H. G., MARBLEHEAD, MASS.—There should be no question about this at this late day. It is fully recognized and acted upon by those who have large business interests at stake, the great canning factories of the country. One of the largest of these informs me that it has for years had the same variety of corn raised by three growers whose farms are about 200 miles apart, in a north and south direction, with the object of having this seed corn mature in the same order when raised for canning in the neighborhood of their factory; and the result has been attained, that raised farthest north maturing first and the other two lots following in the order of their latitude.

E. A. F., HANCOCK, VERMONT.—About five years ago, about the latter part of May Flea-beetles beset my garden, and cabbages, turnips and beets all fared alike, they were all being destroyed. I dusted them with ashes and lime, but to no purpose. I mixed a strong dose of ashes and Paris-green and with it dusted the ground around the vegetables that had been eaten. The beetles soon left. They didn't like the dust.

What Others Say.

LUDICROUS LEGISLATION AS TO DOGS AND SHEEP.—THE legislature of North Carolina passed a law compelling the owner of a dog which was known to have killed or injured sheep, to pay two dollars in cash for each one killed, and one dollar for each one injured. The Progressive Farmer in commenting upon this, says that this act, if it means anything, means to elevate the dog and give him more privileges than heretofore. To say that a dog may kill a sheep for *two dollars* and may injure a sheep for *one dollar*, what does it mean? A grade South Down wether sells for four to six dollars, and a grade Cotswold sells at five to eight dollars for mutton. A pure-blood Merino, South Down, or Cotswold *lamb* sells for 10 to 50 dollars, according to breeding. The city of Baltimore, to encourage sheep husbandry, sells the South Down lambs from the Druid Park flock at the low price of $25 each. Does this bill mean that if any farmer has any improved breed of sheep, worth from $10 to $50 each, a dog is authorized to go and kill them for $2 each? If this be so, farewell to all attempts to improve the breed of sheep. Farewell to all stock raising, and let *all cotton and all tobacco* be the cry—buy everything else. Would it not be better to pass a bill making it a crime to have a sheep?

WHICH MAY REMIND YOU.

MOST people who consider cabbage an essentially coarse food are unacquainted with the Savoy class, says W. F. Massey in that excellent journal, Garden and Forest. Even the Savoys which have been crossed and increased in size and coarseness, like the Drumhead Savoy, are still far superior to the ordinary Flat Dutch and Drumheads. And now we have a variety known as the Netted Savoy, which combines fair size with the highest quality. The difficulty in growing all late summer cabbages is due to the ravenous green caterpillars which eat them so greedily. Pyrethrum powder will destroy the worms if constantly and thoroughly used, continues Mr. Massey, but the marauders come so rapidly that if the application is not made almost daily it is useless, and with good pyrethrum at 75 cents per pound, it will not take long to spend the value of the cabbages.....

This is true enough if the pure dry powder is used. But it should be borne in mind that it can be greatly extended with plaster and still be effective. Moreover, if pyrethrum water is used, the expense is inconsiderable, since a table-spoonful of powder suffices for a pailful of water. With a hand pump, long hose (say 10 feet) and spraying nozzle (Vermorel is about the best for cabbages) the plants may be sprayed rapidly, with comparatively little exertion and at cost for the powder scarcely worth considering.....

MR. CLARENCE M. WEED, of the Ohio Experiment Station, says that his Station's experiments last year indicate that spraying plum trees with Paris-green water is effective in killing the curculio. Four ounces of the poison to 40 gallons of water.....

IT is easy to understand, says the Philadelphia Weekly Press, how some cows may get into a habit of living with a minimum of exercise. We have known some men to get into the same way and never discovered that it made them more efficient. To keep a nervous, high-bred cow confined to one spot for months together with, perhaps, her head fastened in a stiff, unyielding stanchion, looks very much like cruelty to animals. Dehorning is nowhere compared with it. If the injurious effects of confinement do not show to any marked degree in the present generation of cows, they are certain to crop out in an enfeebled offspring.....

CAREFUL EXPERIMENTS to show the relative shrinkage of silage and hay, made in Lancashire, England, and reported in the Live Stock Journal, show that two tons of meadow grass made into hay, leave 12½ cwt. Two tons of meadow grass put into silo come out 34 cwt. of silage.. .....

PROF. HENRY of the Wisconsin Experiment Station, after two years' experience with Prickly Comfrey, thinks it may be valuable with dairymen for soiling purposes, but that it is not likely to hold a prominent place in our agriculture .....

ALFALFA is another plant, says Prof. Henry in the Breeder's Gazette, that has received some attention in the East of late years. From Colorado westward it occupies a very important place among farm crops and on irrigated lands of the West gives enormous yields. The plant is a legume, like clover, but is a perennial, so that when once it occupies a field, with favorable conditions it continues indefinitely. It yields from two to eight tons of excellent hay per acre per year at the West, and it is no wonder that the farmers in the Eastern United States, when they learn these facts, are so anxious to try it. In most cases attempts to grow Alfalfa at the East have not succeeded. The New York and New Jersey Experiment Stations report very fair success. Alfalfa on the Wisconsin Station grounds stood about 10 inches high in early May, but on the whole it has not been a success. Unless the conditions are very favorable he thinks the farmers east of the Rocky Mountain section should not attempt to grow this plant. With a porous subsoil and the water 10 or 15 feet below the surface, also perhaps on sandy land with a sandy subsoil, Alfalfa may be tried with some chance of success. In general, however, Red clover is much better suited to Wisconsin needs than Alfalfa. Clover gives a good crop the second year after it is sown, and can then be turned under for enriching the soil. Alfalfa requires two or three years to get well established, so that the farmer can hardly afford to use it in the rotation of crops even if it succeeds.....

COW PEAS, lupines, vetches and seradella have also been tried at the Wisconsin Station, but appear to be of little value as compared with clover..... ....

T. B. TERRY, in the Ohio Farmer, says he harrows his potatoes three times with a Thomas harrow—the first time soon after planting; the last time, usually, just as the sprouts are coming out of the ground. Some seasons two harrowings are enough. All he wants is to keep the surface mellow and not let the weeds see daylight. He wants to be sure the weeds are cleaned out just as the potatoes come up. Before they start again he takes care of them with cultivators and avoids all hand work and horse-hoes. When harrowing the first two times he keeps the horses between the rows (there are ridges over the drills so he can see them) and, last, he harrows cross-wise to level the ground and be sure of killing all weeds.....

THE report of the N. Y. Experiment Station, Peter Collier, Director is all things considered, the best we have seen. It fills 406 pages and should be examined by every farmer. Careful experiments made by the Station, prove that the liquid portion of the stable manure contains approximately the same amount of fertilizing material as the solid portion; but, in addition, the portion present in the liquid portion is in a condition rendering it immediately available to the growing crop. This portion which is so generally allowed to be wasted, through imperfect methods for its preservation, it is proposed by the Station to save completely..... .....

"WHO can doubt," says Dr. Collier who was one of the judges in the R. N-Y. Potato Contest, "that the great yield of potatoes secured at the rate of 645 bushels to the acre of one variety, and 1,076 bushels of another variety, under the conditions of soil and climate obtaining in the locality where the trial was made, was due wholly to the fertilizers applied and the method of cultivation employed?"

IT is doubtless true that the results may be less, equal or greater, in the same or another place and another season might have been modified or omitted entirely without affecting the result recorded above; but Dr. Collier thinks none will doubt that with all the limitations and modifications which science would demand before accepting any conclusion from the trial, *it does possess a decided value practically and scientifically which will be found helpful in the production of large crops in the future*.....

THE R. N.-Y. was the first, so far as we know, to ascertain that the pyrethrum plant is quite hardy in this climate. We have now a dozen plants growing in the open ground, that were planted five years, or more, ago—both roseum and cinarariæfolium. The New York Station raised some plants and a quantity of the unopened blossoms was gathered and dried in a shaded part of the office, after which they were pulverized in a mortar. The strength of the powder as compared with samples of Buhach, an insecticide made from another species of pyrethrum grown in California, was then tested by putting two grammes of each in a large fruit jar, introducing live flies into the jars and noting the time required for the insects to become paralyzed. In seven trials, the flies placed in the jar containing the home-grown powder fell first four times; those in the one containing the Buhach twice, and in the other trial both fell together.

SOME 70 varieties of potatoes were tested by Dr. Collier. Below we give the names and yields (rate per acre) of those which yielded most. The R. N.-Y. No. 2 stands first. The yield was at the rate of 266 bushels to the acre. Then we have as follows:

Gov. Foraker	214 bushels.
Summit	201 "
Stump of the World	179 "
Green Mountain	173 "
Morning Star	167 "
Lombard	165 "
Delaware	161 "
White Beauty	151 "

NEW QUEEN yielded but 102, Early Puritan 95, Crown Jewell 80, Sunlit Star 74, Charles Downing 68, Early Ohio 43, Mrs. Foraker 50, Ohio Junior 48.....

SPROUTED TUBERS used for seed yielded less than sound seed, the difference amounting to 10 bushels to the acre. No advantage was gained by being careful not to injure the sprouts.....

As between seed pieces exposed to the light and warmth and those not so exposed, the difference amounted to little.....

THE R.N.-Y. guesses that the chief advantage in exposing seed to the light is that it enables one to reject all potatoes with weakly or "blind" eyes.....

AT the suggestion of the R. N.-Y., Dr. Collier endeavored to find out whether it is better to place the fertilizer *above* or *below* the seed pieces. The results with him, as with us were negative..... ....

THE following conclusions may be made from the New York Station's well conceived series of potato experiments:

1. Little or nothing was gained by using cut potatoes for seed, over whole tubers of the same weight.

2. Seed tubers badly sprouted yielded about 8½ per cent. less than unsprouted ones.

3. The earliness of the crop was not influenced by exposing the tubers to light and warmth before planting.

4. The yield was materially reduced by removing the seed end of the planted tubers.

5. Fertilizer placed below the seed may be slightly preferable to fertilizer placed above it. The fact was not clearly established.

CORN EXPERIMENTS again show that needless root-cutting in cultivating is injurious. Thus we see that the truth of the R. N.-Y.'s assertions, made 10 years ago, is confirmed.

Experiments were made by Dr. Collier to ascertain in how far stirring the soil conserved moisture.

HERE are the conclusions: 1. That keeping the surface of the soil stirred, if only to the depth of half an inch, increases the water content of the first twelve inches to a very appreciable degree.

2. That the deeper the tillage, at least up to four inches, the greater is the increase in water content.

3. That the rate of increase diminishes as the depth increases.

4. That a slight mulch exerts a far greater influence in retaining water than tillage four inches deep.

An observation made while excavating for a lysimeter in the latter part of August is appropriate here, as showing the depth to which surface tillage affects the water content of the soil. The excavation was made on a dry ridge, in order to escape bottom water, and on one side it reached into the corner of a plat that had been plowed in the spring, but upon which no crop had been planted, and which had not been cultivated during the summer. The soil it was necessary to remove was very dry and hard, except beneath this plowed portion, where it was so much moister and softer that the labor of excavation was very materially reduced. The influence continued to be noticeable to the depth of at least two feet.....

DR COLLIER'S CONCLUSIONS as to the wireworm and its part in causing scab in potatoes differ from the R. N. Y.'s belief founded upon observations made in its own soil:

1. Millipedes do not feed upon the sound tubers of the potato.

2 Their food consists of decaying vegetable matter.

3. The presence of millipedes in the hills with the scabby tubers was due to the scab, they being attracted by the decayed portion which they desired for food, and the scab is not due to their presence.....

DIRECT.

——BISHOP POTTER: "That political corruption is alarmingly prevalent; that it is the most perilous portent of the age, is amply borne out by every careful observer. Political jobbery, public service for revenue, position for perquisites—these are blood poison in the body of the Republic. Just now they are rampant, voracious and ferocious. Partisanship is a kind of brigandage, and the purchase of votes is made in the open streets."

——GARDEN AND FOREST: "Dead grass and leaves should never be burned. It is an expensive and wasteful custom, and a sure indication of extravagant and therefore bad management. It is a poor policy and thriftless management which burns up plant-food in large or in small quantities, and sooner or later it will make the best land sterile."

——PROFESSOR GEORGE H. COOK, Director of the New Jersey Agricultural Experiment Station: "The weakness of human nature is such that nothing but the chemist's tests and publication is sufficient to hold the dealers to the furnishing of fertilizers of standard purity. More than 40,000 tons of commercial fertilizers were used in our State last year, which were sold for considerably more than a million dollars, and the amount used in the whole United States is more than a million tons annually. Of the quality of these the farmer can form no judgment from their color, smell or taste, or their general appearance. The analysis and publication of the composition of these fertilizers have a most salutary effect."

For Tired Brain.

Use Horsford's Acid Phosphate.

Dr. O. C. STOUT, Syracuse, N. Y., says: "I gave it to one patient who was unable to transact the most ordinary business, because his brain was 'tired and confused' upon the least mental exertion. Immediate benefit, and ultimate recovery followed."—*Adv.*

Dyspepsia

Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds; it will cure you.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

JOHNSON'S ANODYNE LINIMENT ESTABLISHED 1810.

For Internal and External Use.

Stops Pain, Cramps, Inflammation in body or limb, like magic. Cures Croup, Asthma, Colds, Catarrh, Cholera Morbus, Diarrhœa, Rheumatism, Neuralgia, Lameback, Stiff Joints and Strains. Full particulars free. Price 35 cts. post-paid. I. S. JOHNSON & CO., Boston, Mass.

ITHACA HORSE RAKE

Hand-Dump and Self-Dump Patterns.

OVER 100,000 IN USE.

ITHACA PORTABLE ENGINE

Economical, Strong, and Safe.

POSTSCRIPT.

AS we go to press with the last pages of this issue, news comes from the Rural Grounds that the following mixture seems to repel the flea beetle: Two parts of fine, sifted unleached wood ashes to one of plaster, which had previously been poisoned with London-purple in the usual way, and snuff (tobacco) at the rate of one pound to a barrel of the mixture. It is thought that the fleas are repelled by the ashes alone. The London-purple was added to kill the potato beetles and thus to render an additional application unnecessary. We learn that the flea-beetle is very destructive on many Long Island farms.

"No greater mistake is made in the management of stock, than the plan too often adopted on the principle that all that is necessary is that the animals shall be well or liberally fed. Horses that are well cared for and always carefully used will do well on a very ordinary ration; while horses receiving no care and that are carelessly or severely handled will not thrive on the best of feed."—DR. KILBORNE, page 363.

WE have got yet one more name to add to the list of judges for the R. N.-Y. Potato Contest. It is that of Mr. A. W. Cheever, a practical farmer, and agricultural editor of the New England Farmer as well.

THE R. N.-Y. wants all the help it can get in the battle with the flea-beetle. Some of our correspondents write us that they have been troubled with the insect for some years. What we want to know is, what have they done to keep it in check?

"So we try to coax ourselves to believe that a beefy cow will pay her way with the help of the steers. But will she do it? Not in the East where land and feed are high; or in the West where dairying is made the business of the farm."—A. L. CROSBY, page 362.

WE gave, last week, an item of news concerning the proposed effort to foster the flax industry in this country. The R. N.-Y. is assured by those who have carefully looked into the matter that there is much of promise in the idea. It is confidently claimed that a new machine has been perfected that will revolutionize the flax industry almost as completely as Whitney's invention of the gin revolutionized the cotton industry. Figures on another page show how America would be benefited by such a revolution.

"They beat Mr. Terry in China, for they keep asses and mules and feed them on the potato tops; they cannot afford even hay. Horses, like men, must live on what they can get, not on what their fancy may dictate, or their appetite approve. There is a wonderful elasticity about the requirements of the animal body."—MR. DAVENPORT, page 363.

Two horses on the New Jersey farm have not had 100 pounds of hay during the past month. They have had good pasture, when not at work, cut grass, wilted or partly cured, and grain. They have kept in excellent condition though they have done their full share of work. This fact is worth noting in connection with the ideas advanced by those who discuss Mr. Terry's plan of feeding clover hay to horses. Do we feed our horses more grain than they need? The R. N.-Y. believes that many of us do, just as it believes that many of us eat a great deal more meat than we need.

THE R. N.-Y.'s asparagus bed (consisting of many so-called new kinds) is attacked by the asparagus beetle. On several plants the writer saw last week hundreds of eggs, a dozen or more of the beetles and about fifty of the worms (larvæ or grubs). These worms may be seen eating the leaves just as the currant worm eats the leaves of currants and gooseberries. As soon as our readers discover plants so infested it is better to do one of two things, viz., dust them with sharp, sifted coal ashes, slaked lime, or, what is surer to kill, Paris-green or London-purple and plaster. But the use of poisons would necessitate great care in washing the shoots unless cutting ceased after the application.

"In my opinion the feeding of less hay and a little wheat bran or whole oats, will not only prove more acceptable to the animals, but also tend to better results in building up the bony structure of the growing young, as well as in promoting its general thrift. In my own case, I consider such a mixture of feed, as also an occasional feed of corn fodder, and even straw, not only economical but healthful."—JOHN M. TRUE, page 362.

THAT despised plant, the cactus, is destined to become a power in the development of the Southwest. The plant is nutritious, succulent and hardy. It grows where nothing else will and supplies almost enough water to relieve the thirst of cattle. When mixed with the native cotton seed it forms a more perfect ration than any other product indigenous to that region. But along with these good qualities it is cursed with thorns so sharp and terrible that even the animals maddened by thirst or hunger are held at bay. Thus these thorns prick millions of dollars away from Texas. Did nature make a mistake in this arrangement?

"Some horses are very easily kept, and will do a moderate amount of work, and at the same time, keep fat, on a ration that would barely keep the skin and bones of another horse together. No general ration can be given that will suit all cases."—DR KILBORNE, page 363.

THERE are several points about the sorghum sugar industry that deserve attention. One is that only in a country possessing plenty of coal and water, abundance of cheap land and a warm climate can a factory be successfully maintained. Another is that sugar can be made cheap only by the introduction of cheap labor. Sorghum cane brings but $2 per ton. Take from this price the cost of growing, hauling the crop, and what is there left to attract an ambitious farmer? Still another point is the fact that the plant for a factory is so expensive that only a rich corporation can work the business. The R. N.-Y. suggests that convicts in our State prisons might be made useful in the sorghum industry and thus help to settle the prison labor question. There is already a clamor from some parties that Alaska should be used as an American Siberia. It would be better to locate the American Siberia in a warmer climate and employ convicts at sorghum sugar making.

IS CREAM, cream? We are used to calling milk, milk, without any regard to the fact that there are such wide differences between different samples that they might well pass for different substances. The R. N.-Y. has been studying, with considerable care, the milk from the various cows that ran in the pasture, and the result would indicate that what we call "milk" varies so greatly in actual value that it is impossible to adopt for it any standard price that is fair. Now, is it the same with cream? Will a quart of cream from a Jersey cow make any more butter than a quart of cream from a Holstein, supposing both samples to have been raised under exactly the same conditions? Those who advocate the cream-gathering system of dairying argue against the injustice of paying a uniform price for milk when it is clearly evident that one sample of milk may be far more valuable than another. They assume that cream is cream, in other words, that the difference between the butter-making ability of one cow and that of another stops at the creamer, and that one sample of cream is just as valuable as another. Are they right?

"The people have the unquestionable right to demand that the government shall offer a fair price for the railroads, and that if the owners refuse to sell, it shall construct competing lines where such lines would be most effective, and operate them for the benefit of the people as a department of the Civil Service."—C. W. W., page 369.

TRADE SECRETS.

THERE are a-half dozen things in this paper that might properly come under this heading. There are plenty of them in any number of the RURAL. We mean bits of experience and observation that, if worked out by a mechanic as a part of his trade, would never be made public. When a mechanic hits upon some method that enables him to do his work a little cheaper or better than his fellows can do it, he keeps it to himself, guarding it as a part of his stock in trade. Intelligent farmers do not work on this principle. That is plainly evidenced by reading through a file of the R. N.-Y. This year we have already given at least 100 plans for work, that are deserving of being patented and are worth hundreds of dollars to the originators. Some of the men who guard their "trade secrets" most zealously accuse farmers of being stingy and illiberal. This is a great mistake. In the matter of square generosity and conscientious desire to aid their co-workers, the best American farmers stand pre-eminent.

It is a part of the R. N.-Y.'s business to collect and publish these trade secrets. Most of those to whom we apply are very willing to give information. They realize that they lose nothing by helping their fellows. In fact, they believe that they will gain in the end by improving the general character of agricultural produce. Here is one instance that shows two things. A short time ago the R. N.-Y. set out to find how certain dairy prizes were won. Lists of questions were sent to the various prize-winners. With one exception, they replied promptly, giving minute and interesting accounts of the manufacture of the prize articles. The one refused to tell how the work was done unless the R. N.-Y. paid $100 for the information. It seems evident that in printing this symposium the R. N.-Y. gave its readers information worth a good deal of money, while those who contributed to the fund of knowledge were exceedingly liberal-minded men and women.

"I say it with the fullest conviction, after years of struggle in that land and in this, that the American farmer who is industrious, intelligent, persevering, is one of the most favored of men; his lot is, or should be, one of peace and comfort, and if there be such a thing as envy in my heart, there is no man I envy so much."—C. BOOTH, page 365.

RAISING TROTTERS ON THE FARM.

AT a farmers' institute held at Friendship, N. Y., last winter Mr. Seth Fenner made the following statement:

"I can select 100 trotting-bred stallions in my vicinity, and take all the colts they have ever sired and sell them at auction, and they would not bring enough to pay for the service of the stallions that sired them."

This statement seems to have stirred up the breeders of trotting horses to a high degree of excitement. Mr. C. J. Hamlin, president of the Buffalo International Fair, has sent out a letter in which he gives the names of 13 farmers, neighbors of Mr. Fenner, who have sold colts at from $300 to $1,700. These colts, he says, were "raised by farmers who pay but little attention to horse breeding, but owning good mares, they know the value of good crosses." Then he goes on to say that "the American trotting horse should receive the most careful attention of the farmers of this land. Foreign markets are being rapidly opened. Every important nation in the world is looking at the American trotter. The time is not far distant when this land cannot raise enough good horses to supply the export trade. The sure and valuable incomes the small farmers of France have been reaping from the sale of horses to Americans will soon be repeated in this country where we may look for the buyers of the world."

It occurs to the R. N.-Y. that Mr. Fenner may have been nearly correct in his statement without weakening in the least Mr. Hamlin's argument. There are good horses and poor horses. The farmers who select a trotting stallion just because his services are to be secured for a small sum or who take an inferior mare to a high-priced stallion and expect a first-class colt are always disappointed. Mr. Hamlin's figures prove that the farmers he mentioned patronized the best stallions. Mr. Fenner can perhaps make his assertion good and show farmers who have patronized poor stallions at a high rate for service and then handled the colts so that they proved failures. We believe Mr. Fenner went on to speak of the influence of a fast horse on farm morals and industry. We have never had much experience with very fast horses. Old "Doll" and "Bill" can get us over the road at a rate of speed that keeps business going. We know good men who thoroughly enjoy a ride behind a fast horse and who are in no way spoiled by the ownership of a good trotter. We have had neighbors whose sons were most certainly carried into fast habits, fast acquaintances and fast moral decline by a fast horse. This leads us to conclude that lots of men who try to raise trotters are totally unfitted by nature to understand or appreciate that business. A good deal of the loss from fast-horse breeding is due to these misfits.

"The farmer's son is just as honorable and is as honorably employed when taking a load of hay to town and carting a load of manure home to enrich the farm, as he would be if standing behind the merchant's counter measuring dry-goods, and the prospect of setting up in business for himself is as 100 to one in favor of the worker on the farm, at the present low price of farms, compared with the chances before the clerk."—FRANKLIN DYE, page 366.

BREVITIES.

STRAWBERRIES are cheap and will be cheaper.

READ the "Extract from an English Letter" and then be doubly thankful you are an American citizen.

Of course you have planted some fodder corn for the cows to eat in August. The R. N.-Y. has planted some roots too.

STRAWBERRIES and cream, baked potatoes, good bread and butter, lettuce and the promise of green peas in a few days. Do you want anything finer?

ONE of our readers finds the handling of apple wood profitable. We learn that there is a good demand for second growth ash. It is used for base ball bats.

THE R. N.-Y. has a field badly run to brush and weeds which it wants to clear. The plan is to mow the brush in August and turn in some sheep. Is this right?

SOME years ago $26,000 were refused for the famous Jersey cow, Mary Anne of St. Lamberts. She was sold at auction last Tuesday for $2,100. The uninitiated will ask what has become of $23,900 of her value?

LARGE crates about the shape of peach baskets are now made for green peas and string beans. They hold about as much as the old-time square crates, and can be packed one in another, and thus returned in a less bulky form.

FOR three years we used "oniony" milk and butter. This year we have none of it. This happy result has been brought about by keeping the cow away from the onions. She has not been pastured for weeks, but is fed cut grass and grain. Soiling pays us.

IT is a great advantage to plant potatoes that will sprout evenly. Some varieties are curious in this respect. Part of the plants will grow to a hight of several inches before the others appear. On weedy ground it it evident that this causes much trouble.

LAST year Lima beans brought a good price. The cold, damp spring ruined all the plantings and the crop was light. Sweet corn last year was low. This year in the vicinity of the Rural Grounds everybody plants Limas and reduces the area of sweet corn. What will be the result?

SOME people say that oatmeal and other cereal foods do not agree with them. The writer believes that this is sometimes due to the fact that too much milk is taken with the oatmeal, forming a pasty, mushy mass. He has acquired the habit of nibbling a cracker or slice of bread while eating oatmeal and milk, and thinks it is helpful.

AS is noted elsewhere, the sweet corn canning industry will be sure to lead the silo into any community. The silo affords the best means for preserving the stalks from which the ears of corn are removed. It is only a matter of time before this fact will be amply demonstrated. In these times agriculture is forced to settle itself into the most profitable grooves or go out of business.

IT may be well to repeat here what was said last year about the chemical composition of the corn plant. The leaves and the husks are the most nutritious parts of the plant, containing three-fourths of all the albuminoids. It is evident then that the most profitable corn for ensilage is one that suckers freely and presents the greatest amount of leaf surface with the smallest stalks.

WESTERN agriculture is adapting itself to new conditions with amazing rapidity. We have a letter from an Iowa subscriber who says he has contracted to raise sweet corn for next season's use in Iowa canning factories. He has 138 acres in sweet corn to be used as seed exclusively. The sweet corn canning industry has been supposed to belong to the Northeastern part of the United States. It would appear that this notion is unfounded.

Miscellaneous.

THE R. N.-Y. LAKELET.

(*See First Page.*)

FIG. 133 on the first page is a continuation of the photographic views taken last spring at the Rural Grounds.

No part of the premises is more valued than this little body of spring water. In truth, as we have said before, without it the place would be deprived of fully half its charms. There are three of these lakelets connecting, each one lower than the other, separated by grassy banks, the water flowing over dams. They might be stocked with black bass or trout if the different owners were willing to co-operate to that end. As it is, they are alive with sun-fish, suckers, pike, eels, turtles and the like. The 32 carp put into the R. N.-Y. lake several years ago have never since been seen. There are so many springs that bathing is not relished, the water, even in midsummer, being too cold.

THE POST-OFFICE AND THE RAILROADS.

The farmers' numbers and independence give them great influence in legislation; agitation of each novel project must precede legislation on it; the telegraph, telephone, express and railroad business to be conducted like the post-office, by the general government; reasons in favor of such a change; undoubted right of the government to force it, paying a fair price for the property appropriated; advantages of it; how best to aid in bringing the change about.

As a class the farmers by whom the RURAL is mostly read, are so situated that they are not only among the first to feel the evils that oppress the world and reduce its prosperity below the proper level; but they are also better able to locate and define these evils and to set in motion the remedies than most other classes of people. The RURAL has often shown its good-will to aid in so doing. The ballot is considered the instrument of power for reform, yet each step of progress must be initiated by other means, and the object sought must be pushed to an issue before the ballot can be brought to bear upon it.

There is a movement now on foot looking to the reduction of letter postage in the United States to one cent. The rate is already so low that no further reduction could make any perceptible difference in the people's burdens. There is no desire anywhere to make the Post Office a source of revenue, and it is probably best for the people that it should continue to be practically self-supporting. If, however, a movement could be inaugurated to extend the Post-Office system to all telegraph, telephone, express and railroad business, it would result in great benefit. If the postal business of the United States were left to private enterprise, as all other business is, then the cost of sending a letter to any point would depend on the distance it must be carried, and the number of letters usually passing over the line of its journey. Since the object for which the business would be conducted would be the enrichment of its owners, of those who had invested in it and carried it on, the rule, as in rail-roading, would be to "tax the traffic all it can bear." As it is, the people conduct the Post Office through their agent the government, and the tendency is ever, as it should be, to give the most efficient service possible at the lowest possible cost.

If the postal business of the country were now, and always had been, in private hands, there is no argument that can now be advanced against putting the railroads of the country in charge of the General Government to be operated for the people's benefit at cost, which would not apply to the Post-Office with all its might; but, if a majority of the people demanded it, the change would, nevertheless, be quickly made. The people have the unquestionable right to demand that the Government shall offer a fair price for the railroads, and that if the owners refuse to sell, it shall construct competing lines where such lines would be most effective, and operate them for the benefit of the people as a department of the Civil Service.

Several benefits might be gained from this. First, as in case of the Post-Office, it would give the people the service of the railroads at cost, and the tendency would always be to diminish the cost and increase the efficiency of the service as fast as possible. Second, it would put the Civil Service of the country on a strictly business and non-political footing at once, as the Civil Service reform movement demands. Third, it would promote the adjustment of the changed methods and conditions of the world's work, which are now culminating with so much power for good or evil, to the people's welfare, as an ever-beneficent evolution, instead of as a disastrous and explosive revolution to which these conditions might easily give rise if that adjustment were too strongly resisted.

Now, how can the readers of the RURAL help to bring this change about? This article will probably meet the eye of many, each of whom will say "That is all right; I will vote for it the first chance I get." But if nine-tenths of the voters of the United States were of that mind, and that was all, the chance to vote for it would never come. There is no lack of political machinery for making the people's will effective in any direction in which they may choose to act; but it is necessary that they should *act* if anything is to be accomplished.

This is what the writer would suggest:—Let every person who would like to see the Government of the United States assume control of the railroads and operate them for the people's benefit talk the matter up with others in his own school district, not neglecting to carry the agitation into other sections as opportunity may arise. Then let as many as can be interested in the movement in each school district appoint one of their number to write a letter to the representative in Congress in whose district they live, asking for his aid and influence to bring the desired change about, telling him that they have associated themselves to promote that change by every means in their power until it is accomplished, and let all sign the letter. By the time a majority of the members of Congress find their mails full of such letters the movement will be felt with some power. Let the readers of the RURAL brace themselves for a long, strong pull, and pull all together and they will see this thing start, and slide into place with a promptness that will make the capitalists' heads swim. The change is surely coming. C. W. W.

Huron County, Ohio.

CORRESPONDENTS' VIEWS.

NEED OF MORE EYE-OPENING.—At a recent meeting of the Connecticut State Board of Agriculture at Danbury, Dr. Bowen raised the query: "How are the great body of farmers to get the much needed information with regard to the many frauds which the better informed among them understand perfectly are being worked on them?" It won't do for the Board of Agriculture to ventilate these things, and the public press, catering for city interests and city schemes, will not do it; the papers themselves being practically in the ring.

How then shall the farmers get at the truth of these things which so closely affect their interest, and which are far more vital to them than any fancy, scientific methods by which produce is continually made more plentiful and consequently cheaper and at the same time of better quality for city epicures? The doctor proposed as one means to this end that every farmer should withdraw his support from all papers made up mostly of plausibilities, clippings, etc., and give it to the paper which lends its columns most liberally to a truthful, out-spoken exposure of such matters. Some time ago I came to this conclusion for myself and I believe that a farm paper run on this plan more extensively than any has ever yet been run, would be well and heartily sustained by farmers. They are ready for it. A. W.

Litchfield, Connecticut.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

WOMEN with short, plump necks will be glad to learn that the newer styles in neckwear are specially adapted to their appearance. There is a tendency to make the collars lower, or to replace them with falling frills or fichus. What are known as Empire ruches consist of a fine mull or lace plaiting about two inches deep, which turns over, and is brought down to a point in front. This is very pretty and becoming. The favorite fichus, either large or small, are bordered with frills, after the style affected by Marie Antoinette. Some are brought to a point in front and knotted on the breast; others are looped at the waist line. Very pretty, quaint-looking ones are seen in sprigged and dotted muslin; others in China silk and Canton crape. But their grace and effectiveness depend largely on the taste of the wearer.

Very pretty trimmings for the wrist are full little undersleeves of muslin, tulle, or net—they make a very good trimming when the sleeve is a little short. They are in the form of a puff about three inches deep, closely shirred at top and bottom. The bottom shirring is about one inch from the edge, so as to form a frill. They are very pretty when the bottom shirring is drawn in with pretty baby ribbon, tied in a little bow at the back.

Some charming Directoire cravats are like those worn by French lawyers a century ago. They consist of a close-fitting band for the neck, with two square ends in front. These are closely plaited, and fall straight. These cravats are usually made of sheer muslin or silk mull; they are very demure-looking, and yet jaunty.

* * *

JUST at present the redingote is at the hight of its glory. Everybody wears one, and they range all the way from beauty and becomingness to positive hideousness. We saw a stout woman recently wearing a very straight, very tight, cloth redingote, in color a lively pea-green. It had revers and trimming of a flamboyant brocade, pea-green and Indian red, and the misguided woman who wore it had an air of serene satisfaction, which showed that she thought her attire all it should be.

* * *

THOSE Persian embroideries still hold a favorite place as trimmings—as a rule they are charming, and lighten up a gown wonderfully. A plain frock of black alpaca, simply made, was rendered charming by a little Persian trimming of silver and dull blue. Among the handsomest passementeries for trimming black silk are those which show a mixture of colored metal and beads with plain jet, giving an Oriental effect. Appliqué embroideries form another handsome trimming, but they are, as a rule, very expensive.

THE FAMILY ACCOUNT-BOOK.

OLIVE E. DANA.

IT is a small thing I bring to aid in solving the vexed and vexing problem of household finance, yet, rightly used, it may be a helpful one. One who has not tried the plan may not guess how money matters may often be simplified and straightened by the careful keeping of household accounts. Let the mother do it if the children are small and the good man of the house is disinclined to "bother;" by-and-by the little daughter can be taught to do it, and take pride in it.

This family book-keeping should include an accurate record of all moneys received and of all expenditures. It need not be conducted in any strict and scholarly fashion; nor is it necessary to go to the opposite extreme—nails and seeds hob-nobbing with sugar and molasses, followed on the next line by an entry of thread and cotton cloth.

This, indeed, is to my mind, better than no account keeping. But I think it much better for the kitchen expenses to be by themselves, and for the expenditures for out-door needs to be in their own place, while outlays for dress, postage and the like occupy yet another portion of the family account-book. Of course, when there is a fixed income, the trouble is much less than where both sides must be followed, as in the case of the farmer. And if only one side can be kept I would count the outlays; for we are apt, the most of us, to count on if not to count up our gains even in anticipation, while the corresponding expenditures are not always so carefully regarded.

Was it not Garfield who attributed his success largely to the fact that, at some time in his college course, he was led by the example of a fellow-student to make good use of the "margins" of time? And we do not need to remind ourselves that it is usually the "margins" allowed or disallowed or wholly forgotten, that are the secret of the problem. The mistress of the home will soon see if too much or too little relatively is spent on the table And with the entries before her, she may often bethink herself how less of this commodity and more of that, or *vice versa*, would have conserved the health and comfort of the family. And if too much is being spent in any other department, if the dry-goods bill overshadows the outlay for groceries, or, on the other hand, is shrunken to unseemly size beside it, or if both groceries and dry-goods could have been made to yield a "margin" for repairs or furniture, for books or papers, for the payment of a debt or to be given in charity, or to be set down as a desirable deposit in the family bank-book; if such there be, why these facts are apt to be much more evident if the figures tell them.

That English fashion of which we read is a good one—having the girls of a household begin very early to set down their personal expenses. Rather unchildlike it may seem, but why should not the little ones come by such degrees to the knowledge and the sharing of these oft-times heavy burdens?

There is a good deal of satisfaction to be gotten out of the family account book. It is a multiplication of the pleasure the wage-earner finds in the constant and careful squaring of his or her small accounts—a pleasure every woman-worker ought to know. But in this family book-keeping which becomes also something like a diary, with its associations of related facts and dates, the greater satisfaction accompanies the greater utility.

Father may like to know just how much he paid for last year's fencing-wire; and then, if he knows the date, he perhaps can decide some other little mattter when his memory did not quite serve him truly, and is glad to know just what potatoes, or butter, or apples, or berries were bringing last season And mother bethinks herself that this is an off-year for clothes, and finding that the little record-book justifies her in the expenditure, delights herself and the family by a new and needed carpet.

And then what comfort in knowing just what any given crop realized! The receipts from the berries, when the vines have given all their fruit, the gains from the dairy or orchard, or potato-field—it is double assurance of the success of the year's work, to see these profits, small though they be, set down in honest, solid figures. The lessons of the little book give wisdom, courage and hope for the next glad sowing and reaping. So, by all means, have a household account book, and keep it.

OUTINGS IN NEW ENGLAND.

VII.

MARY WAGER-FISHER.

ONE morning Anaximander came in with the announcement that a whaling steamer was in the harbor and was immediately to leave for Provincetown, to return in the afternoon, and if I could get ready in a "jiffy" we would take passage, so I was ready in a "jiffy" and we boarded the steamer with the usual result that attends precipitancy, to find that we might have had a quarter of an hour more time at our disposal. Provincetown is at the extreme end of Cape Cod and the boat was four hours in making the run. It was a new whaler, and during the seven months it had been at sea 13 whales had been captured. The whales were shot—the gun for this purpose being short and heavy and mounted on a projection from the bow of the boat. A long lance shell is shot from this gun and enters the whale and explodes inside him—a horribly cruel procedure, as the animal does not immediately die, but is sickened by it, and coming to the surface is easily harpooned and hauled in. It was a rough tiresome voyage, and we were glad when the "tip end of Down East" was reached, although Provincetown is anything but a charming spot to rest in. One would suppose that a place so decidedly out at sea would be cool and refreshing. But it was hot and sandy and "fishy." It is built on a coast of sand and stretches out to the length of two or three miles. The sand promontory is some two miles wide, and very good water, with no brackish taste, is obtained from wells. We had for our dinner some fresh cod which was very good. Along the wharf, cod were being unloaded, the fish being removed from the hold of the boats with a large pitch-fork as if so much hay, and put into dories partly filled with fresh water, then rinsed off in this; and repacked in casks. The manipulation was cleanly and the sight of it in no wise modified my liking for "pickled cod." One of the fishermen asked me to look at some cod-liver oil which he pronounced very fine. He said that they threw the livers in a cask and the oil exuded without further operation—the oil settling clear to the bottom and the refuse rising to the top. I don't know how true his story was, but when he lifted the cover from the cask, the odor that came from it was sickening, but thoroughly cod-liverish. As I had in years gone by swallowed several quarts of oil, I declined his invitation to take a swallow from that fearful cask.

As Provincetown was the spot where the Pilgrims first landed, and where they fell on their knees and thanked God for having safely crossed the ocean, we felt in duty bound to walk about and see if anything but sand and sea were to be seen. It was also in Provincetown harbor that the Pilgrims in the cabin of the Mayflower signed the compact for government by which they were to be guided in the New World. It was a co-operative company, and for some time everything was in common, and even when

they reached the comfortable possession of a cow, the good beast was owned by a dozen different families. What ingenuity must have been required to make enough of the milk to go around. We climbed a high hill on which the Town Hall once stood—afterwards burned—and whence we could see the sea on both sides of "Province Land," where people can stake off and take up the land (sand) without cost, then sell it (if they can!) and give a quit-claim deed. As the land is constantly shifting, it would seem that land tenure there must be a very uncertain thing. As everywhere in New England, the door-yards were bright with flowers. At three in the afternoon we steamed away for Plymouth, and had a cloudy, squally voyage, and the ill-luck to run on a sand-bar in the harbor, as the tide was low. The sailors beguiled the time we had to await the tide, by singing Salvation Army hymns, and discussing Captain Cora, the leader of the "Army" that for several months had been holding daily meetings in Plymouth with gratifying success. We became in turn much interested in Captain Cora, who was an educated New England girl, and who had become, a year before, a convert to the Salvation movement. She was uncommonly pretty, very fair, a fine pianist, a beautiful singer and devout as a saint. And that her beauty and accomplishments had inspired a religious fervor in the hearts of a great many people, was not to be wondered at.

Before leaving Plymouth, which is now a flourishing manufacturing town, we visited a tack factory, and left it feeling how wonderful is machinery, and the men who invent and operate the machines. The superintendent told us how many paper boxes—the ordinary 10-cent tack box—one of the girls in the establishment would fold in a day. I did not make a note of it at the time, but if my memory serves me right, it was 2,800. The papers are cut by machinery. Women always excel in work in which deftness of manipulation counts; but whatever establishments I have visited, and have made inquiry as to the pay of the women employed, I always hear the same story of higher wages for men and lower for women.

Our month in Plymouth had been in every way so delightful, both on land and water, that we were loath to leave, and eased our regret by dallying along the coast northward, stopping at Duxbury, Marshfield and Brant Rock. As Daniel Webster's home was at Marshfield, the country all about was redolent of his fame. An old farmer at Duxbury told us that he used often to see him fishing and shooting, a very good-hearted-looking man, but in such shabby old clothes that no one would have thought him worth a cent. He related an ancedote of the statesman, who was accosted by a couple of dudes (not knowing him) who hired him to carry them over a stream, which he did pick-a-back. Anaximander and the laddie went on a tramp to the Webster farm and to the graveyard where he lies buried. Adelaide Phillips, the singer, is buried also in the same yard, and while her grave had at that time no headstone, it was covered with flowers, marks of the devotion of her brother, who is a florist. The soil about "Mashfield" (local) and Duxbury is very poor in appearance and D. W. probably never made much money by farming. Some apple trees in Duxbury, however, were so loaded with fruit that we asked an old man who owned them, how he managed to bring about such a result? He said that when he planted the trees they began early to die at the ends of the limbs, and some one told him to dig around the roots and put salt in the trench! This he did, and with satisfactory results. Another man said that the best thing for apple trees was to turn in "critters" (hogs!) and hens, the former to root and the latter to eat up the insects, worms, etc.

From Marshfield we rode in a four-horse barge for three miles in a nearly straight line toward the sea, to Brant Rock. The rock from which this watering place takes its name, is of enormous size, and at high tide is an island. The sea air here is of peculiar quality, and very beneficial to many persons. Shooting coots and gathering Irish moss form the chief visible occupations. What impressed us most at Brant Rock was the honesty of the landlord of the C. hotel An overcharge was made in our bill, which some days later was discovered by the landlord, who forwarded to Anaximander the over-paid money. Honesty, surely, was not dead in the land.

"A MERRY HEART DOETH GOOD LIKE A MEDICINE."

WE hear so much now-a-days about bad habits; why not say something about good ones? And the first to be thought of is the blessed habit of cheerfulness. I call it a habit, it must needs be one; for it is easy to be cheerful when you are happy, but it takes a deep-seated determination to appear so when you are miserable. Many would say cheerfulness is closely allied to hopefulness, but there is a difference, for one can be cheerful when he or she hopes for nothing.

Melancholia is one of the most terrible words in the English language, indicating a condition the most to be dreaded. A direful contagion is mild in comparison with it. It is a scourge to the sufferer and a continual trial to all who come in contact with him. I firmly believe that, in nine cases out of 10, this "disease of the mind" is only an aggravated form of selfishness, for we know that by thinking and planning for the comfort and happiness of others, we can forget ourselves and our own troubles. What this old world needs is a people of perpetual cheerfulness. We have had a "reign of terror" in the shape of melancholy and downheartedness long enough; let us be thankful for the blessings we have; if these seem too small to count, let's try to make other people happy. What if your life is full of sorrow and bitterness and care and grief, it is the life of many others as well, "There are broken hearts in the world to-day, though smiling faces hide them." God bless those smiling faces! for it is a grand thing to triumph over the sorrows of self and shine forth in all the glorious raiment of cheerfulness. You don't know how much good a cheerful face may do; you don't know how far it may reach. One person may not be able to make a dozen people happy, but one person *can* make a dozen miserable; it is a part of this life that the power of evil is stronger than that of good.

"Go bury thy sorrow, the world hath its share." It makes no difference if the world knows nothing of the anguish that tugs at your heart-strings, your sorrows are too sacred to be bandied about from mouth to mouth. Take the staff that has been the stay of many a way-worn traveler; "let not your heart be troubled,' it is only for a little while and if we can make a beam of sunshine in the hearts of a few or many it is accomplishing much; besides, just as you lighten the burdens of others, just so much you lift from your own heavy load.

Mothers, if your children have no other education, you can at least teach them to be cheerful by example, it will be of more benefit to them than the finest education without it. Don't let them find fault and complain; teach them from the beginning the best of all good habits—cheerfulness.

H. BELLE CHAPMAN.

HAPPY HOMES.

THE study of the home-life of my friends and acquaintances for many years past, has convinced me that there are comparatively few happy households. This fact was most unpleasantly forced upon me the other evening where a little gathering composed of the representatives of ten homes had met together at the house of my friend B. and his charming wife. They were all literary people, which made the matter still more serious and lamentable, for if people of intellect do not know how to choose their life partners wisely, what is to become of the vast unthinking multitude, who mate as lightly as the birds.

It was only necessary to watch our host and hostess for half an hour, to know that here at least was one happy home. The perfect confidence, which it was easy to see existed between them; B's knightly courtesy when he addressed his wife, and the love which illumined Mrs. B's somewhat plain face when she turned toward her husband, made a picture worth studying. Then in my spinster-like fashion, I fell to thinking of how few homes were to be found like this ideal home. I had known all of those present for many years. There was C., handsome, brilliant, and refined, who 10 years ago married a dashing society girl—well, they are still sheltered by the same roof, but only Heaven knows what that home must be since they have both been refused the divorce for which both have sued.

Half an hour in the society of D. and his pretty, querulous, contradictory little wife is sufficient to show you the "true inwardness" of their lives. The bearing of E. and his wife toward each other shows that they have reached the stage of calm indifference, an indifference so veiled by a kind of high-bred dignity that only an intimate friend, or a very close observer would guess that, too proud to bear the slightest breath of slander, they are simply waiting until death does them part.

It does not require a very keen critic to tell that scholarly, gentle F. could know no true union with the silly, frivolous, chattering and over-dressed doll at his side, while G. and H. were unaccompanied by their wives, who, as it is very well known, are never seen in company with their husbands. The remaining three couples I knew to be well mated according to the world's standard, but of the 10 homes here represented, I said to myself, there is only one ideally "happy home." Truly, mused I, it seems as if some one else but God has a hand in setting "the solitary in families."

"I rather think you and I have the best of it, do you not?" said a voice at my side, which I knew to be that of the cynical and sarcastic L. the most confirmed bachelor in my circle of acquaintances.

"No," replied I, as my fingers unconsciously grasped the worn circlet of gold on my left hand, while with an odd choking in my throat I thought of that lonely grave somewhere on Confederate soil. "No, our host and hostess have the best of it." And then through the flashes of keen wit, and biting sarcasm with which L. regaled the company for the next half hour, I sat and vaguely wondered at the why and wherefore of it all.

True, I have had no opportunity to practice what I preach or to avoid the pitfalls into which I see others fall, but I find women too narrow, tactless, selfish and uncompanionable, and men too indifferent, thoughtless and uncourteous Sometimes I am inclined to think that no man or woman who is not a good, true Christian, is to be depended on to make a good husband or wife. Lovely impulses are good, but principle, and above all Christian principle is better. Marriage is very much like the Kingdom of God in this respect; seek your own happiness and you are likely to lose it, seek that of another, and you are almost sure to find your own.

All the syndicate writers of the day have told wives how to win and keep husbands, and have made plain to husbands the way in which they should walk; so of my own weak wisdom I will only endeavor to impress upon both husbands and wives this one bit of advice. Be as free to speak words of praise as you are to reprove. Better still, be so "slow to anger" that you never speak words of reproach.

A. SPINSTER.

LITTLE THINGS.

IT is "little things" that consume the time as well as the money of the housekeeper. "I am so tired!" sighed a lady the other day, "and yet I have done nothing to-day except pick up. It is Monday, and it seems as if every article of clothing and furniture were out of its place this morning. Jennie's hat and gloves were on the piano, and her best cloak on the back of the sofa. Fred's room looked as if he had been holding high carnival in it. Every piece of linen had been removed from his drawers, I suppose in a search for some particular article, while coats, trousers, and neckties made his apartment look like the establishment of a second-hand clothes dealer. Really one of my greatest troubles is this continual 'picking up.'"

"Tell it not in Gath," because I would not have my immethodical friend think that I had criticised her unkindly, but if she begun right, she would have saved herself many precious hours. It is quite possible, without being too strict, to teach a child order and neatness, and nothing promotes a love of these virtues so much as having a room that he can call his own.

Whether boys or girls, they should be taught to take care of their own clothes, and more for their sakes than her own, a mother should see to it that her entire Monday is not spent in picking up after careless members of the family. Thoughtlessness is not always selfishness, and the girl who throws work of this kind upon the unresisting shoulders of her mother, is often not so much to blame as the mother herself who has failed to train her in the way she should go.

GOLDEN GRAINS.

BEECHERISMS.

ENTHUSIASM is good to raise men upon, but discipline is the only thing to fight on.....

MEN are responsible for sin, but not for infirmity. Infirmities are the mistakes which men make on their way to knowledge.....

HUMILITY in furs is better than pride in a cowl.....

HARDENING of the heart is very apt to end in softening of the brain .....

MANY speak the truth when they say that they despise riches and preferment; but they mean the riches and preferment possessed by other men.....

THERE is need in this world of every help. Simplicity, silence, and a soul open to the invisible light, are chiefest means of grace.

THERE are sweet surprises awaiting many an humble soul fighting against odds in the battle of a seemingly commonplace life.....

NO metaphysician ever felt the deficiency of language so much as the grateful.....

WHERE there is room in the heart there is always room in the house.....

INFINITE toil would not enable you to sweep away a mist; but, by ascending a little, you may look over it altogether. So it is with our moral improvement; we wrestle fiercely with a vicious habit, which could have no hold upon us if we ascended into a higher moral atmosphere ....

I NEVER saw anybody so poor that he did not bid fair to live till he died; and dying is the best part of life to one who knows how to live worthily.....

A NEW life is the best and the most sublime penitence... .....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

TRIFLES.

"ONLY a trifle as light on the wing,
As the veriest insect devoid of sting,
Only a trifle, ah! mortals, beware,
This trifle may build you a mountain of care!"

WE count trifles, as little things, and very often pass them by without a thought, but life is made up of trifles. Sometimes a word, a look, or a gesture, small in itself, may cause us to do or say a thing that will affect all our future lives. When we think of this, and of how the trifling things we do or say may affect others, how careful we should be! This is especially true where children are concerned. The little ones look up to mamma and papa as the embodiments of wisdom. They drink in what they hear and as soon as they begin to talk, lisp the words of their elders. How if these words are not what we would care to hear from baby lips? If we hear something that is not right, said by baby, and know that we ourselves said the very same thing not long before can we punish the little one for it? No, for if we do, we are cruel. We must be careful.

Some years ago the following instance came to my notice. A little girl was coming from school when she met her aunt. The aunt gave a message to the child and told her to be sure to tell her father exactly what she had been told. The child did so, and the father was very angry at the message and expressed himself very forcibly. Some days later as the child was on her way from school again she met the same aunt in company with several very stylish ladies. "Well, dear," said the aunt, "did you deliver my message to your father?"

"Yes, ma'am," said the little thing brightly.

"What did he say?" asked the aunt.

"That you must be a confounded fool," said the little one, never dreaming that she was doing wrong.

The aunt was furious—the ladies laughed, and the child retired in confusion. The next day the aunt called on the child's father and there was a regular row.

After she had gone the father insisted on having the child punished, but the mother declared that she had only told the truth, and if punished for it, (even though the truth had been unpleasant,) it would teach the little thing to lie, or be deceitful. The disagreeable feelings caused by this one trifling instance lasted for years.

The old saying "Little pitcher's have big ears" is very true. Then, let us give the "little pitchers" plenty for their ears. Stories, tales, anecdotes, etc., told in the presence of children will often be remembered by them far better than lessons studied by rote. They may only be trifling little things, but, nine times out of 10, when people are grown they can go back and repeat some of the tales they heard papa or mamma tell when they were tiny tots, trifling though they were.

Some days ago I saw the sweetest little black-eyed baby one could imagine. I smiled

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria
When she became Miss, she clung to Castoria
When she had Children, she gave them Castoria

at him, for I have a great fondness for children. He returned the smile in the friendliest manner possible. Then I said, "Will you shake hands?" He did so. Finally I said, "Oh! but you're a sweet little thing!"—Imagine my surprise when he responded "You lie." The dear little thing hadn't the faintest idea what that meant, and his poor mother was covered with confusion, but he had heard it. Children are like looking glasses. They reflect what passes before them; unpleasant as well as pleasant pictures. Again I say, *be careful*, especially in regard to trifles, or what to us may seem such.

Never, busy mother, be too busy to give your child a smile, or a pleasant word. It may do far more good than you can imagine, and it is such a trifling thing to do! I remember that, when a child, I worshipped a lady and would have done anything for her, because once she patted my head, smiled, and called me "dear." I thought her the most lovely of all women, and I wouldn't for the world have done anything that she would not like. Since I have grown up I look back in wonder at my adoration of this lady, for she is homely and plain in every way—but my love for her and my desire for her approval kept me from doing many a naughty thing.

"Great things from small beginnings rise
Sands make the mountains, and trifles, life."

DORA HARVEY VROOMAN.

AROUND THE HOUSE.

ANNIE L. JACK.

THE birds are so wild with the excitement of the beauty around them that their music is incessant, and city guests complain of the early awaking. Their music seems more excellent than ever this spring, and I say that it is because the sportsman of the family has taken a farm of his own, and with it his gun. He is a Bohemian student of nature, but has not yet learned Emerson's test of forbearance

"Hast thou named all the birds without a gun?
Found the wood rose and left it on the stalk?"

The robins are vagrants of the forest and seem happy everywhere, in a tree or raspberry bush, where they build so as to be convenient to the choicest fruit. We try to protect the birds, but they have many enemies among their own kind, and blackbirds and sparrows rob the nests of other birds and drive them away.

The hyacinths and many other plants have succumbed to the unusual winter, for we had a wet autumn, with alternate freezings and thawings without snow in the early part of the winter, and the effects can now be seen. Poor pear trees! Planted with such hopes, they have dwindled away, and this year suffered worse than for many seasons.

Our favorite, the Golden Queen raspberry, and its friend, the Cuthbert, have been winter-killed, and show dead tops with a carpet of green suckers on the ground. It is the same in the neighborhood of Montreal where fruit-growers have plowed up their strawberry land and planted corn, or some other green crop.

I talked of entering the lists in the Potato Contest, but concluded it was not for me, who have plenty of out-of-door exercise, and almost live in the garden, but for those who do not know or enjoy the delights of planting and watching, caring for and harvesting a crop. It is a noble undertaking, and will lead to many important results, besides bringing roses to pale cheeks. I am glad so many have shown their interest, and bye and bye they may be able to say, quoting again from Emerson.

"All my hurts my garden spade can heal."

In the house we are busy as usual, and the advanced season makes work pressing. Our hard-wood floors make house-cleaning much lighter work than where there are many carpets, but the oiling and shellac polishing that have to be done after the cleaning is over, are an arduous task. But, then, the work is so very beautiful when finished, that it is worth the trouble.

I asked one of the girls what she was doing with a piece of blue-beech wood chopped fine at the end after the fashion of a paint-brush. She said it was a "pot scrubber" made to go into the corners. Ours was of home manufacture, but such things can be bought I believe. All these little labor-saving contrivances are worth knowing.

The unexpected heat has brought out the blossoms of fruit trees at least two weeks too early for this climate, and we are fearing a cold spell may yet come. Asparagus is a week earlier than usual, and we enjoy it plentifully. It is a vegetable that should be on every farmer's table, being equal to eggs in nutritive properties, and containing the same elements. Half an ounce of seed will furnish more plants than a small garden needs, but it is a paying crop to grow and needs no replanting. The Conover's Colossal is really as good as any variety.

TO WASH AND IRON COLORED GOODS.

ADD one pint of salt and two handfuls of meal to three gallons of water. Stir until the salt is dissolved, put in the goods, wet evenly and let stand one-half hour. Then wash, dip into scalding water, rinse in two waters, blue, hang up wrong side out and I think you will find the colors clear and bright. When ready to iron, sprinkle lightly and iron with a very hot iron on the wrong side. Never expose colors to the sunlight during the washing process as it will dim them.

MRS. W. S. WAITE.

THE best preventive of the fading of cotton goods that I have found is *potato water*. Peel and grate Irish potatoes in soft water enough to wash the goods—say a dozen medium-sized potatoes to two buckets of water—warm and strain and if the goods are greasy use soap, if not, none is needed. Starch and iron on the wrong side. EDNA M. HASKELL.

BEFORE the goods are wet dissolve one handful of fine salt in a pail of water, in which soak the goods for one hour or until they are well soaked through. Then wash in the usual manner, rinse in water that has plenty of bluing. If starch is required that also should have bluing in it. All colored goods should be dried in the shade and ironed on the wrong side. MRS. G. S. BULLIS.

I ALWAYS take clean hot suds and wash as quickly as possible; then scald them a few minutes (not boil). When I think they have scalded sufficiently, I take them from the boiler and rub them lightly with the washboard, to get the suds all out; then I rinse well and dry. If any article requires careful treatment to keep it from fading, or if I want to keep the colors from mingling, I rinse in borax, alum or salt water. I think a great deal of the faded appearance of calicoes is due to careless sudsing and rinsing. When the suds are not well washed out they not only rot the goods but give them a dull, faded appearance, and in ironing most colored goods look best if ironed on the wrong side, especially dark ones. MRS. ELLA KINNE.

ODDS AND ENDS.

NOW is the time to put away winter dresses. If the children's flannel or woolen dresses are spotted and greasy, wash them carefully before putting them away. The best way to do this is to add borax to the water in which you wash them. Dissolve a large table-spoonful of borax in a pint of *boiling* water; put about a third of it in the first suds in which the garment is to be washed. (Never rub soap directly on woolen goods). Another third in the next water, and the remainder in the rinsing water. Shake the garments thoroughly before hanging up to dry.

* * *

THE WOMAN'S WORLD gives the following directions for cleaning black silk, and, after trying it, I can heartily recommend it. Thinking that some of the RURAL readers may find it useful I give it to them.

Take ammonia and alcohol—one part of ammonia to three of alcohol—add half as much hot water, and laying the silk over an old sheet folded in four thicknesses, rub well with a black rag or a sponge dipped in the mixture. Have ready some old broom handles, curtain poles, or other smooth, round sticks, and wrap the silk on them as tightly and smoothly as possible. Let it dry in this position. It will need no ironing.

* * *

As this is house-cleaning time anything relative to such work is in season. After you have beaten the dust out of your carpets you can brighten them up wonderfully by sprinkling corn meal mixed with salt over them, then sweeping thoroughly.

Wash your mattings with salt and water, but not brine. Soap turns them yellow, so should not be used. D. H. V.

EVERYTHING IN ITS PLACE.

I THOUGHT the introduction of "The Chain as a Promoter of Domestic Happiness" an excellent idea. I would suggest that brushes and combs be kept in sleeping rooms and in an outer room instead of in the kitchen where cooking is being attended to. A handy way to fix a stove iron is to put a wire around the stove-pipe and fasten a hook on it, so that the stove iron may hang up. If there is a bracket on the stove, a hook can be fastened so that a large cup or dipper can be hung upon it; then when the men come in to wash the first words won't be "Where is the dipper?" Another handy article is the kitchen bangle board. Take a thin piece of board about 16 inches long and seven wide and if you haven't anything better than a piece of black cloth, tack that smoothly over the board. Take a piece of red braid 2½ inches long and tack each end of the braid to the board; this makes a place for the shears. Then below put in a number of brass-headed tacks to hang button-hooks on. Draw a brass chain quite tightly across the board and drive a tack in at each end. This makes a good place for pencils and pen-holders and all such things. Then there is no excuse for not keeping things picked up.

MARY BENNETT.

TO DO UP SHIRTS AND COLLARS.

AFTER shirts and collars are nicely washed and rinsed in two waters—one clear and the last with a little bluing in it—I wring them out in boiled starch made by dissolving the amount of starch required in a little cold water, then pouring over it boiling water and stirring it at the same time, until it is of the thickness required and looks cooked. Hang out to dry and when ready to iron, starch again in cold starch made by adding cold water enough at first to dissolve the starch. I then add a small pinch of salt to keep the irons from sticking, and then pour on cold water enough for the amount required. Wring out collars first and roll up in a dry towel; then the shirts, folding the dry part of the shirt over the starched portion and roll up snug. Iron in one or two hours. Rub the articles with a clean cloth to get off all loose starch, iron quickly, finishing up collars and cuffs by shaping them round and pinning one and putting the rest inside. Put in a warm place to get dry and stiff. I use a bosom board for the shirts. I am careful to starch and straighten the bosom and to rub well with a cloth before commencing to iron. When ironed hang in a warm place to dry.

MRS. J. R. H.

COFFEE OR SPICE CAKE.

I WOULD like the good sisters who read the RURAL, to try this recipe, which I have tried so many times and always found good. One and a half cup of sugar, one cup of good coffee, one-half cup of butter, two eggs, one good tea-spoonful each of cinnamon and cloves, with a little nutmeg, two full tea-spoonfuls of baking powder mixed thoroughly with two and two-thirds cups of flour. Cream butter and sugar then add the other ingredients, except the eggs, which should be well beaten and added last. Bake in a moderate oven. MRS. S. C. TAYLOR.

The Aged

Who need help in their many infirmities, especially those afflicted with rheumatism, find great relief in

AYER'S Sarsaparilla.

"One year ago I was taken ill with inflammatory rheumatism, being confined to my house six months. I came out of the sickness very much debilitated, with no appetite, and my system disordered in every way. I commenced using Ayer's Sarsaparilla and began to improve at once, gaining in strength and soon recovering my usual health. I cannot say too much in praise of this well-known medicine."—Mrs. L. A. Stark, Nashua, N. H.

Ask your druggist for

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.

Price $1; six, $5. Worth $5 a bottle.

For a DISORDERED LIVER Try BEECHAM'S PILLS. 25cts. a Box. OF ALL DRUGGISTS.

PEERLESS DYES Are the BEST. SOLD BY DRUGGISTS.

W. R & CO'S IMPROVED BUTTER COLOR

IF YOU REALLY WISH to use the very best Butter Color ever made; one that never turns rancid, always gives a bright, natural color, and will not color the buttermilk, ask for *Wells, Richardson & Co's*, and take no other. Sold everywhere.

More of it Used than of all other makes combined. Send for our valuable circulars. WELLS, RICHARDSON & CO., Burlington, Vt.

ICE CREAM AT HOME!

Made cheaply and quickly by using a Triple Motion

WHITE MOUNTAIN FREEZER.

Will freeze in half the time of any other Freezer and produce cream of the finest quality. Inquire for the "White Mountain" of your local dealer in house-furnishing goods.

"Frozen Dainties,"

A book of Choice Receipts for Ice Cream, Sherbet, Water Ices, etc., packed with each Freezer this season, or will be mailed upon receipt of ten cents in stamps.

White Mountain Freezer Co., 134 Hollis St., Nashua, N. H.

GOLD MEDAL, PARIS, 1878.

W. BAKER & CO.'S Breakfast Cocoa

Is absolutely pure and it is soluble.

No Chemicals

are used in its preparation. It has *more than three times the strength* of Cocoa mixed with Starch, Arrowroot or Sugar, and is therefore far more economical, *costing less than one cent a cup.* It is delicious, nourishing, strengthening, EASILY DIGESTED, and admirably adapted for invalids as well as persons in health.

Sold by Grocers everywhere.

W. BAKER & CO., Dorchester, Mass.

News of the Week.

HOME NEWS.

SATURDAY, May 25, 1889.

Two weeks or more ago Dr. P. H. Cronin, a reputable Irish-American, who was connected with several Irish pseudo-patriotic Irish secret societies, disappeared from Chicago. He had been outspoken in charging that a large proportion of the funds collected in this country for the benefit of the National League and other Irish interests had been misappropriated by the officials through whose hands they passed here. Hence he had incurred the bitter enmity of many of the leaders and he had frequently said that he expected to be assassinated. Shortly afterwards, a trunk stained with blood and clotted hair was found in a remote vacant lot and it was asserted that it had contained Cronin's murdered body. Diligent search, however, failed to find the latter. Rumors were industriously spread that he had fled to escape punishment or prosecution for crime; a number of anonymous assertions were published that he had been seen in several places in Canada and in this country, and even alleged interviews with him were telegraphed to all parts of the country and published in the papers as genuine. Wednesday evening his dead body was found in a sewer in one of the outlying streets of Chicago, where it had evidently been for a fortnight or so. It was identified by upwards of 40 intimate acquaintances, and bore numerous cuts in the head and other plain indications that the man had been murdered. Intense excitment; but no arrests yet.....

Last Thursday Mr. August Belmont's crack two-year-old colt St. Carlo in one minute two and a half seconds won $20,000 by outrunning his 12 competitors over the course of five furlongs in the race for the great American Stake—the greatest monetary prize of the spring meetings—at Gravesend, L. I. near this city.. .....At a church festival at South Glastonbury, Conn., the other day 111 persons who partook of vanilla-flavored ice-cream became sick, and at last accounts some were still in danger of death. Some attribute the mishap to poisoning by verdigris from the corrosion of the copper vessel containing the cream; others think the vanilla seasoning was poisonous.....In Philadelphia, Thursday, Henry Specht obtained a verdict of $20,000 in a damage suit against the Pennsylvania railroad. In October, 1886, a passing train struck his wagon, killing his child and badly injuring himself.....The Navy Department calls for proposals for the construction of three new cruisers of 2,000 tons burthen to cost $750,000 each. With the vessels lately built, those on the stocks and those already contracted and to be contracted for, we shall soon have at least a fine nucleus of a navy..... .....The pension appropriation act for the current fiscal year appropriated $80,400,000 for the payment of pensions, and $8,000,000 were also appropriated for the same purpose to meet a threatened deficiency, making a total appropriation of $88,400,000. This whole amount will be necessary to meet the demands of pensioners and it may be that there will be a deficiency, but it is said at the Pension Office that there is no truth in the statement that $105,000,000 will be expended for pensions during the fiscal year..... ....Twenty-two State legislatures have discussed, and 10 States have adopted, the Australian ballot system. The 10 are Massachusetts, Indiana, Rhode Island, Missouri, Tennessee, Minnesota, Wisconsin, Montana, Connecticut and Illinois.....For want of a market farmers in Oregon are literally throwing potatoes away. For example, Mr. Tyszkiewicz, of Bachelor Island, lately dumped 350 casks of fine Burbanks into the Columbia river.....Postmaster-General Wanamaker and Attorney-General Miller are considering the question of excluding from the mails advertising matter of the Louisiana lottery swindle.... The trial of the electric sugar frauds has just begun in this city..... It has been estimated by the Railroad Commissioners of Connecticut that over 20 millions of dollars would be required to remove the 1,200 grade crossings in that State. Nevertheless, the grade crossings ought to go..... Monday afternoon a fierce hurricane ravaged a swath half a mile broad through one of the richest farming sections of Pennsylvania, north of Scranton, sweeping away or injuring dwelling-houses, farms, orchard and other trees, crops, etc., and hurting several people, but none fatally.....The new steamer of the Hamburg packet line, the Augusta Victoria, made the trip from Hamburg to New York, 3,048 miles, in eight days one hour, thus beating the record.....The sheriff of St. Francis county, the city marshall of Forest City and another citizen were killed in an Arkansas election riot the other day..... Allen Thorndike Rice left over $5,000,000 and no will.....A second autopsy held on the body of mind-reader Bishop failed to determine whether the surgeons in holding a post-mortem were operating on a dead or living body. They broke the law, however, in either case by carving the poor fellow up without the consent of the coroner or relatives, and will be prosecuted..... Mrs. Folsom, the mother of Mrs. Grover Cleveland, was married, Monday, at Jackson, Michigan, to Henry E. Perrine, a merchant of Buffalo, N. Y. .....The steamer Rockton, with 20 officers and 450 men from the shipwrecked crews of the Trenton and Vandalia, has reached San Francisco from Samoa ....Wednesday in the St. Lawrence, near Montreal, the ocean steamer Polynesian ran into and sank the Cynthia, another ocean steamer. Eight on the latter were drowned. .....The Imperial government will begin work on the Canadian Pacific defensive works this summer, those about Esquimault receiving first and most attention..... Sixteen States already provide for the decent burial of indigent and friendless veterans, and Massachusetts proposes to join the honorable band at cost of $7,000 to $10,000 a year. Hitherto the Grand Army posts have done this duty..... Missouri, the home of the Cotton Bagging syndicate, the White Lead trust and other monopolistic organizations, has just passed an anti trust law of much severity. Other States, however, have done the same, still trusts flourish rankly, even within their boundaries.....Mrs. Harrison is preparing to move to the Presidential cottage at Deer Park, to which the President will run out on Saturday and whenever he can spare time on other days.....Ex-Secretary Bayard is soon to marry Miss Clymer, the 39-year-old daughter of the late Dr. George Clymer of the navy.....Secretary Blaine has appointed Louis Dent of Washington to be his private secretary in place of Thomas H. Sherman, the new consul to Liverpool. Mr. Dent is a nephew of Mrs. General Grant, and assisted Mr. Blaine in his preparation of his "20 Years in Congress." Mr. Sherman will sail for Liverpool with his family June 12 ..... The Essex club, of which Dr. Loring is president, dined him at Boston Saturday, on the eve of his departure for Portugal as U. S. Minister... .....Considerable dissatisfaction is expressed at an alleged tendency to nepotism on the part of the President. The present list of the appointments of his own people to office includes a brother, a brother-in-law, a father-in-law of a son, the brother of a son-in-law and a cousin-in law..... ..Montana's convention for framing a constitution for the new State, is Democratic by from three to five majority—38 Democrat, 35 Republican, one Labor and one Independent members..... There will probably be a Republican majority of 12 in the Washington constitutional convention, though farmers and workingmen are generally fusing with the Democrats.....The new Inman line steamer, the City of Paris, arrived at Queenstown at 2 o'clock Wednesday morning, having made the fastest eastward passage on record. Her time between Sandy Hook and Fastnet light was five days, 22 hours, and 10 minutes, and six days, 29 minutes to Roche's Point—the point to be passed in counting time .....California now has an anti-dressed meat law..... The lower House of the Michigan legislature has voted in favor of woman suffrage in school elections by a majority of 58 to 34. The Senate has still to pass on the measure.....Judge Childs, of Buffalo, New York, has just condemned William Zemmler, the crafty murderer of Tillie Ziegler, his mistress, to death by electricity—the first legal victim of that form of execution in any part of the world. .....Jerry Rusk is looming up pretty strongly as a Presidential possibility —soon it may be a probability.. ..... Much excitement among the 2,000 English-speaking fishermen of St. George's Bay, Newfoundland, at the action of the captain of the English man-of-war Lilly, who has issued a proclamation that Frenchmen alone have a right to fish there. The fishermen insist that they have a concurrent right to do so, and make fearful threats if an attempt is made to prevent them.....It is announced that an English war vessel will protect Canadian craft catching seals in Behring Sea which this country claims as its exclusive property, forbidding the catching of seals there by any vessels except those licensed to do so, and then only at a certain season..... .....Hail storms have visited Iowa and Illinois and a snow storm has surprised a large part of Virginia during the week, while many parts of Wisconsin have suffered from severe wind and rain storms.....It is reported that an English syndicate want to secure control of the large flouring industries of the United States just as another is now buying up the breweries. It is now negotiating for the great Pillsbury Mills at Minneapolis. It also proposes to purchase a number of elevators.....A new scheme of transporting packages is coming into favor. The inventor, John G. Williams, is a resident of this city. His machine consists of a magnetic car, hanging from a single rail, where it follows a streak of electricity. With one horse power it is said that one ton can be thus transported 1,440 miles a day at a cost of 30 cents. This, in mail matter, would represent some 2,880,000 letters and by this system packages of mail could be sent off every five minutes if necessary, thus preventing large accumulations. The single track is to be carried on tripods some distance above the ground and the car will pass through coils of insulated wire at intervals. Four miles a minute would be the average speed.....

Listen Now.

It is on the principle we are eventually induced to accept an oft-repeated song that we present to your attention these modest little bulletins of Compound Oxygen.

DECATUR, GA., July 29, 1888.
"My son is now in good health. He has had no attack of Bronchitis since taking Compound Oxygen." MRS. A. A. CONN.

MAPLE VALLEY, Wis, May 14, 1887.
"Compound Oxygen has saved me again with God's blessing and I feel very thankful to Him, and to you, of course."
MRS. G. M. JUDD.

GREENFIELD, OHIO, April 23, 1887.
"My complicated disease is evidently giving way to Compound Oxygen. Am better in every respect" MRS. B. T. GRISWOLD.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; a chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 120 Sutter Street, San Francisco, Cal.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, May 25, 1889.

RECENTLY a car-load of cattle was received at Buffalo from the West, the most of which were suffering from a scrofulous disease known as lump-jaw. They were smuggled through the stock-yards early in the morning, switched upon a private track belonging to a large packing firm, and but for their accidental discovery by a passer-by, would in all probability have been slaughtered and packed as "Extra Family Mess." The animals were in a terrible condition. Their heads were covered with tumors, one of which after being cut off weighed 11 pounds. A city physician declared that there was enough poison in the cattle to poison every person in the State. In commenting upon this circumstance, one journal uses it as an argument against State inspection of cattle, claiming that the system of inspection in vogue at Chicago and other large packing centers prevents the receiving of such cattle, and that they are therefore shipped to smaller Eastern markets where they are disposed of without difficulty. Another journal uses it as an argument in favor of State, or, still better, national inspection, so that all great slaughtering points shall be under strict governmental control. Meanwhile the dear people will take their lives in their hands, and continue to eat Western beef..... There is to be a hay press contest at the Mississippi Agricultural College June 18 and 19. Director Tracy has invited all the hay press manufacturers to enter the contest. The hay business of Mississippi is getting to be an important interest. This contest will show all the presses working side by side.....Sisal was introduced into the Bahama Islands 25 years ago; the inhabitants considered it a nuisance, and used every means in their power to extirpate it. A radical change of opinion has been brought about by the present governor who is very sanguine of the success of its cultivation.....The Secretary of Agriculture recently made a suggestion to the Secretary of the Treasury that imported crude potash salts of the higher grades, as, for instance, the almost pure salts of potash, which is a form particularly valuable for fertilizing purposes, be admitted to free entry under the provision of the free list for "Guano manures and all substances expressly used for manure." Secretary Windom has informed him in reply that his suggestion cannot be carried into effect under the existing statutes in view of the express provision of the tariff act prescribing a duty of 20 per cent. ad valorem for crude potash and sulphate of potash without regard to the uses for which they are intended.. Prof. Wm. Brown, late of the Ontario Agricultural College, has gone to Australia to take charge of the experiment farm at Doven, Victoria.....The dairy works of Cornish, Curtis & Green, of Fort Atkinson, Wis., were recently destroyed by fire..... ....The New York State Weather Bureau is being organized with headquarters at Cornell University.....The lake rate on corn from Chicago to Buffalo dropped from two cents to 1¾ cents..... Latest reports from Chicago say that the receipts of old corn from the interior are very heavy.....Texas reports the cotton prospect better than ever before at this time of the year.....In several Iowa counties a bounty of five cents each is paid for the scalps of gophers, and in one county alone, over 18,000 have been presented this spring..... The melon growing districts of the State of Missouri, are endeavoring to form an association for the purpose of facilitating the shipping and marketing of their watermelon crop, which aggregates annually about three thousand car-loads..... The Michigan State Agricultural Society will hold its fairs permanently at Lansing, hereafter. An effort was made to have it located at Grand Rapids, $50,000, and 80 acres of land being offered upon certain conditions, but the executive committee voted unanimously to locate at Lansing. The grounds of the Central Michigan Society having a half-mile frontage on the Grand Trunk Railroad, are to be conveyed to the State Society free of all encumbrances, the citizens of Lansing binding themselves to pay $11,000 incumbrance now on the grounds..... The stock stables of William Hamilton near Flint, Michigan, containing about 50 blooded horses, were struck by lightning recently, and destroyed. Most of the stock was saved, but two colts valued at $1,200 each, and the trotting stallion Tecumseh were killed..... The American Horse Show Association, of Chicago, is pushing affairs for its first annual exhibition, which will begin October 30. The two big prizes are the American Trotting Stallion Herd premium of $3 000, for stallion with best herd of five colts, and the American Trotting Stallion Prize of $1,000 for best stallion of any age..... The California orange crop for '88 and '89 is estimated to be between 750,000 and 765,000 boxes of 300 pounds each.....The orange crop of Florida is estimated at upwards of 3,000,000 bushels for the last year.....A corrugated steel hoop has been invented, which is said to be elastic and firm, hugging a package tightly. Four steel hoops will take the place of 10 wooden hoops on a flour barrel. They are cheaply produced by the aid of electricity, a hoop being welded in two seconds. .....Articles of incorporation were filed on Saturday with the Secretary of State for the American Meat Company, Chicago, for the packing, canning and preservation of meat; capital, $25,000,000; incorporators, John C. Richberg, C. E. Randall and G. F. Norden.....Press dispatches received by way of the City of Mexico report a boom prevailing in Yucatan, owing to the profitable results of hemp-raising in that peninsula. The high price of hemp is said to have proved immensely profitable to the local raisers. It costs 4½ cents per pound to raise the product, which sells for 12 cents in New York.....

Literary.

MABEL WHITNEY'S LESSONS IN FARMING.

BY G. C.

MABEL WHITNEY, a farmer's daughter, concluded that she wanted a higher education than their country school could afford her. Her father, a well-to do farmer, concluded that the said common school education was all that any of his children needed. But Mabel thought if she could only obtain a situation to teach the common branches, she could soon earn money enough to pay her expenses, for one year at least, in some seminary. An opportunity soon presented itself, and her parents' consent was reluctantly given.

Mabel applied for the position and was accepted as teacher in the Meltonville school, the term commencing the first Monday in November, the school during the preceding months having been taught by a young man, who was forced to relinquish his position on account of ill health. The position was secured, but not so easily a boarding place.

"How is it," inquired Mabel of one of the trustees of the school, "that the people here seem so averse to boarding the teacher?"

"Well," answered the trustee, "the people about here are mostly retired sea captains, or something of the sort. Got plenty of money, and their wives and families don't want to be bothered, I suppose; but they are wonderfully sociable and kind; I haven't the least doubt but that you will be invited around considerably."

"But," said Mabel, "where did the young man, who was teaching here, board?"

"At the hotel," was the reply.

"I won't board at the hotel, if I can help it," said Mabel decidedly. "But haven't you any poor people?"

"Some few," replied the farmer; "but they are so pesky poor, they can hardly board themselves."

"Oh!" said Mabel laughingly, "I don't mean that kind, but middle class, I suppose you would call them."

"My dear young lady," said the old gentleman, kindly, "Me and my wife would like nothing better than to have you board with us, for company for her, if nothing else, but I live away over here in the corner of the district, so far from the school, and it would be very unhandy for you, especially in rough weather. But, let me see, there is a family that live right near the school-house. It would be just the place for you, if they would only take you, a kind of poor and proud family, a Mr. Early, a city man, who invested his little all in a farm, and is likely to lose it all, if he don't do better. He has no idea of farming, and it seems as though he can't learn, goes behind-hand every year, and he is likely to lose his wife, for she grows thinner and more sickly-looking every year. It seems to me affairs would be different, if things could be turned around, and she be boss. I have seen her more than once trying to hoe, pizenin' potato bugs, or doing any little thing she could. They have a little 13-year-old daughter that is a host in herself; and there are two more little youngsters—a boy and a gal. If you would like to go to see them, I will take you."

Mabel was a little woman, or girl rather, for she was only 17 years of age, but she was very matter-of-fact. And, like her father, whose farm was a model, neatness with her was like cleanliness, next to Godliness; so when they came to the Early farm, her first expression was, "Shiftlessness! what a shame to let a grand old place like this get into such a wretched state."

"It was all in good repair when he bought it," replied the trustee; "but he didn't keep it so long—no bad habits either, only good-for-nothing." On knocking at the door, it was opened by a bright little girl, whom the trustee addressed as Dora, and whom Mabel took at once to be the little 13-year-old daughter. She politely ushered them into a neatly furnished sitting-room, then, excusing herself; went out, presently returning accompanied by a delicate-looking lady, whom she introduced as her mother. Mabel soon stated her errand. The little girl looked eagerly at her mother, who hesitated, in an embarrassed manner, as though hardly knowing what to say.

"I am afraid," she remarked, "that we could not make you comfortable."

Mabel glanced at the tastily arranged sitting-room, and then at, as she thought, the lovely little girl, and sweet-faced woman. "I have no fear of that," she replied.

"Oh! mamma, I think we can," quickly said the little girl.

It seems the mother thought so too; for before Mabel left she had engaged board with them for the school year.

It was not until Mabel was fairly established as a member of the Early family, that she saw Mr. Early, and then, what was her surprise, when, instead of a tired, discouraged, worried-looking being, a handsome, careless-looking man was introduced to Mabel, by the little girl as her papa. The only time that his face clouded was when he alluded to his ill luck as a farmer.

"I have made a mistake," he said, "by having too little capital to work with; but luck and fate appear to be against me; for instance, this summer, I was heartily ashamed of my wheat crop in comparison with my neighbors', but what was a feller to do?" he continued, lightly, "I couldn't help its freezing and thawing all winter. I believe my wheat froze out." Mabel wondered why the freezing and thawing didn't have the same effect on his neighbors' wheat. Every day Mabel saw more and more to wonder at, thinking how different her papa would do, and what the Earlys might accomplish, if they only would. The father was always trying and always in what appeared to Mabel to be the wrong way. The mother and daughter toiled from morning until night, now out-of-doors, now in. Mabel kept her own counsel but felt so sorry for them. She taught Dora at home, for the child could not take time to go to school, but out of the fullness of her heart, one day Mabel spoke. "Dora," she said, "you poor child, you work hard with your poultry; but they don't seem to pay you, do they?"

"Oh, no," replied Dora, wearily; "they never do."

"What do you feed them with?" asked Mabel.

"Corn, and they do eat so much of it."

"Will you let me tell you something about chickens?" said Mabel. "My mother raises a great many of them."

"Gladly," replied Dora. "I will be pleased to have you tell me anything you will, Miss Whitney."

"Well, in the first place," said Mabel; "chickens must have a variety of food. All corn is too fattening. They must have some green food of some kind, and they should have some bone meal, or cracked bones."

"Do you take us for millionaires?" laughingly replied Dora. "Where are we to get all of those things to begin with? It takes capital, as papa would say. You don't know the low state of our family purse."

"It doesn't take quite so much as you imagine, Dora dear," continued Mabel. "You have clover hay, scald some of that for the chickens, and you will be surprised to see how they will eat it. Throw some of those cabbage stumps, that I see out in the field, into the chicken yard. Give them a breakfast of wheat bran or almost anything but corn. Take that old boiler that your mother uses for lye. When not in use, put in it all the scrapings of the table, that you don't use for Ponto or Kitty; boil them with potato parings, cabbage leaves, or any green thing you can get. When you were showing me the outbuildings, I noticed in the root cellar, where potatoes were stored, that there was quite a lot of potatoes with long sprouts, left sticking in the wall, and on the floor. Gather them together, and get some one to bring them in for you. Cook them, sprouts and all, with the rinsings of your frying-pans, and water in which meat has been cooked. Thicken it with a little meal, and in cold weather a little Cayenne pepper is beneficial mixed with the food. There are bones lying here and there all over the place. There is a large pile near the ashbin."

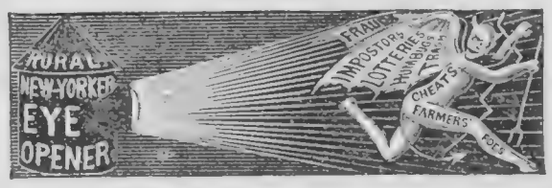
(To be continued.)

BOOK REVIEWS.

THE STORY OF PATSY.—A brief, pathetic story of a crippled child in a mission kindergarten, is told by Kate Douglas Wiggin in a bright yet tender way that captivates the reader, and takes him into the very heart of the gracious work. A helpful book. Illustrated, Houghton, Mifflin & Co., 60 cents.

NORTH AMERICAN BIRDS, by H. Nehrling, is the title of a new work, part first of which lies before us. Mr. Nehrling is an active member of the American Ornithologists' Union, as well as a corresponding and honorary member of several American and European scientific societies; but he says that his work does not claim to be strictly scientific; it is simply intended for the intelligent friend of nature. It is his aim to write a *popular, entertaining and instructive* book, especially for our young folks, so that the extravagant destructiveness so often manifested by boys may give place to the sentiment of affection, and a desire to protect our beautiful native songsters. Part first treats of the thrushes, which are a very numerous family, scattered over a wide range of territory; the American robin, the mocking-birds and the thrashers, and contains 48 quarto pages, printed on heavy paper. It is illustrated by three colored plates.

George Brumber, 286 and 288 West Water street, Milwaukee, Wis. $1.00 per part. To be published in 12 parts.



A BLIND-POOL LAND SWINDLE.—Tyler & Co., of Kansas City, Mo., are sending out a large number of circulars, extolling in very alluring terms their "blind-pool" scheme for speculating in land. It is based on precisely the same principle as the notorious blind-pool swindle advertised extensively by Gray, of this city, about seven years ago, and that advertised by Flemming & Meriam, of Chicago about three years ago, and that puffed up by W. A. Ingham & Co., alias The Speculative Syndicate, of this city one year ago. All of these, however, pretended to deal in agricultural produce or railroad stock, and after a season of profuse, alluring and delusive advertising, all suddenly collapsed after swindling their dupes in all parts of this country and Canada out of hundreds of thousands of dollars. The first flourished rankly for about 18 months and defrauded the public out of about $125,000; the second had a "glorious time" of it for nearly three years, and then the members disappeared with over $1,000,000 of their patrons' money in their wallets; the third raked in the shekels freely for about two years and a half; the concern's victims are still mourning the $250,000 out of which they were swindled by Ingham when he fled to Canada—or Timbuctoo, about a year ago. All were vigorously and repeatedly denounced by the Eye-Opener during the hight of their prosperity, and the final collapse of all was announced with no little satisfaction by him. Like Tyler & Co., they were all modest in their requirements—all they wanted was that their patrons should send in their money freely to be invested by the sharpers according to their own best judgment. The Kansas City fraud says:

"Our system is the combining of a large number of small sums of money into one large sum; with this amount we can, at a favorable opportunity, purchase options on coal, mineral, timber, and other Western lands, and get limited time contracts on same. As soon as we have secured a contract on lands, we immediately place the same on sale at as large an advance as possiole. Sometimes we make 100 per cent. and sometimes as high as 1,000 per cent. on the amount invested, according to the demand for the property."

Here is an alluring extract from the circulars of the same humbug:

"In one of our deals we made $100 for every $5 invested. For example, we bought a three months' contract on 20,000 acres of land at $2.50 per acre, and paid $2,500 down. We sold at $5 per acre and realized a profit of $50,000, 2,000 per cent. on $2,500 or $20 for every $1 invested."

Substitute grain for land and bushels for acres, and you have substantially a repetition of the circulars scattered throughout the country by the other sharpers. Isn't it marvelous that men who make such enormous profits with such unfailing certainty, should be so eager to share them with the general public on such ridiculously easy terms? All this concern asks is that each of its destined victims should mail to it $5, for which a certificate will be forwarded giving the patron a share in the profits. The more $5 sent in the more certificates will be sent out, and the more the crooks will be "in" and the dupes "out." Since his first exposure of Gray eight years ago, the Eye-Opener has denounced and kept track of at least a dozen blind-pool swindlers in farm produce, railroad and mining stocks and other speculative lines, and all of them, without a single exception, have collapsed after a deceitful run of from six months to three years, during which they had persistently swindled their dupes out of all the money they could entice out of their pockets by the most alluring misrepresentations and the most bare-faced falsehoods.

A SOMEWHAT new form of an old swindle is reported from several parts of the West, the latest account coming from Louisa county, Iowa. Two men called on a farmer in that county and expressed a desire to purchase his farm. After considerable parleying, a contract was drawn up, the strangers agreeing to pay $9,000 for the premises. This was really more than the place was worth, otherwise the farmer who had no special desire to sell until the tempting price was offered, would never have consented to the bargain. Just as the discussion was about to close, a third party appeared, and offered $13,000 for the farm, whereupon the two original sharpers agreed to throw up their contract if the farmer would divide the difference with them. This he consented to do, and the party went to town where the farmer drew from the bank $2,000, which he at once handed over to the sharpers. The third man then said that he must go to a neighboring town to draw the money, but promised to return next day to complete the purchase. At last accounts the farmer was still occupying the old place, with a decreased bank account but with $2,000 worth of increased experience. Swindles of this type have been frequently exposed here by the Eye-Opener. There is a strong family likeness between them all. Sometimes a man offers to sell some article, as a violin, a watch or some other thing of considerable value, and not getting his price, obtains permission to leave it for a short time. Meanwhile a confederate comes along and manages to bring the talk round to the object, and after he has examined it, he expresses a desire to buy it for considerably more than the price asked by crook No. 1. Finding that the "innocent holder" has no authority to sell it, he promises to call for it again in a few days. Meanwhile the owner returns and the holder, having already a customer for it at a higher price, buys it, expecting to sell it at once at a higher figure; but, of course, the would-be purchaser never turns up, and the dupe has upon his hands an article he does not want and which as a rule, isn't worth a tenth of the price he has paid for it. From the above two examples one ought to be able readily to detect any of the numerous forms of this swindle which are constantly practiced on the public.

CONCERNS CENSURED.—Under this caption the Eye-Opener will from time to time give the names of concerns he has seen censured in other papers, but which have not been investigated from the RURAL office:—F. Andrews, of Chicago, is declared to be a fraud by local papers. He offers a book, the "Secrets of Bee-Keeping" for 15 cents, and a model hive for $3. The fellow cannot be found at the address he gives, and those who have any dealings with him are certain to be defrauded.... The American Investors' Co-operative Agency, Cincinnati, Ohio, should be left severely alone according to several Western papers....The Monarch Laundry Works, Chicago, Illinois, is denounced by the Farm, Field and Stockman as a catch-penny scheme. The same paper denounces the National Property Exchange, Temple Court Building, Chicago, as a swindling affair, ready to transfer the property of other people from their pockets to its own "with neatness and dispatch."....Investors are cautioned by Western papers against the American Building and Loan Association of Minneapolis, Minn. Its agents are very busy just now in country places trying to get people to take shares in the concern.

CATALOGUES, ETC., RECEIVED.

TEXAS EXPERIMENT STATION.—The first annual report of this station is sent by Director F. A. Gulley, College Station, Texas. It contains a copy of the laws relating to the Station, the Director's report and outline of the work to be carried out and somewhat detailed reports from the various Station officers. Texas is an immense State. It stretches over such a vast extent of territory that it is impossible to conceive of any single locality in the State that could be taken as representing the typical climate, soil and other natural conditions. It can thus be understood that the task of devising a series of experiments that should be of general interest to the State was by no means an easy one. Director Gulley announces the following as his plan for future work. In making this plan he has been aided by suggestions from many farmers' organizations. It seems to the R. N.-Y. that this is an admirable outline.

1. "A study of the most practicable and economical method of feeding cattle for beef and for the dairy.

2. A study of the disease of the cotton plant known as 'Cotton Blight,' or 'Root Rot.'

3. Testing varieties of fruits to ascertain what kinds are best adapted to the State, and at the same time help to designate the varieties by their proper names.

4. Test grasses and forage plants, adaptability to localities, and value for grazing and feeding.

5. Effect of barnyard manure and commercial fertilizers for certain crops.

6. Value of tile drainage for farm and garden crops.

7. Disinfection and inoculation of cattle to protect from 'Texas fever.'"

We are all deeply interested in the improvement of Western and Texas cattle since it seems evident that more and more of our beef s to come from the great plains of the South and West. Anything that tends to improve the feeding, breeding and handling of Texas cattle is of importance to the general public.

The report of the Station's chemist, Mr. Harrington, is interesting. It appears that experiments are being made with cactus as a stock food. For some years ranchmen in various parts of the State have fed cactus to their cattle with a degree of success depending on their ability to remove the small, sharp thorns. Various methods are employed to do this work. Sometimes the cactus plants, after being cut, are singed over a hot fire; at other times the cactus plants are simply run through a cutting machine, while in other cases the cut pieces or even the entire plants are well steamed and then fed to stock. In all the methods the main object is to remove the sharp thorns. While armed with these thorns the cactus is a terrible plant. The cruel Apache Indians delight in using the cactus as an instrument of torture. Their miserable victims are made to dance on cactus beds and when they fall from exhaustion, are whipped with these cruel blades. But by removing the thorns the cactus is transformed into a blessing for the stockman. It grows where nothing else will grow during a drought. The water it contains forms one of its chief values. Chemical analysis shows that it is almost as valuable as carrots or turnips as a stock food and the cost of gathering it is merely nominal. As the writer knows from personal experience, stock are very fond of it when freed from the thorns. The possibilities of the cactus plant for Western Texas are great. The man who invents some cheap and rapid method of removing the thorns will add greatly to Texan prosperity. With cotton seed and sorghum fodder, cactus forms a perfect fattening ration.

The Mesquite bean is another plant that proves valuable as a feed-stuff in Texas. The R. N.-Y. gave a picture of this bean some years ago. Analysis shows that it is superior in nutritive qualities to either corn or oats. The trees are rarely larger than average peach trees. The branches are so pliant that cattle can bend them down and thus feed without harvesting the beans. There are other excellent things in the report that must be reserved for a future article.

RICKER & OSBORNE, ROCHESTER, N. Y.—Catalogue of the Rochester hay and grain carriers and slings. These slings have the advantage of the central discharge and therefore never fail to work. It is claimed that the largest wagon load of hay may be put in the mow in three minutes. This system is the result of much practical experience, and we would advise our readers to look into it. Send for their catalogue.

KANSAS AGRICULTURE.—The report of the Kansas State Board of Agriculture for the quarter ending March 31, 1889, contains crop reports, statistics, reports of various meetings and other interesting matters.

JOURNAL OF MYCOLOGY.—This publication is sent from the Department of Agriculture. It is devoted to the study of fungi especially in their relation to plant diseases.

VERMONT EXPERIMENT STATION.—Bulletin No. 14 is given up to fertilizer statistics and analyses. Explanations of the values of the various fertilizer ingredients are given which seem to the R. N.-Y. about as clear as any it has yet read. The Station has made a canvass of the State of Vermont to ascertain how many tons of fertilizer were unloaded at railroad stations during 1888. It gives the following results.

"The total figures for the State are 4,194 tons. The average selling price was not far from $35 63 per ton; making a total of $149,432.22 paid by the farmers of the State during the year 1888 for the single item of commercial fertilizers. It is safe to say that at least $30,000 of this large sum could have been saved if the system of small purchases on long time could be replaced by the English system of co-operative buying for cash."

The town of South Randolph heads the list with 240 tons.

CONNECTICUT STATE BOARD OF AGRICULTURE.—The 22nd annual report of this society is received from the secretary, T. S. Gold, of West Cornwall, Conn. It would be impossible to give anything like a detailed review of the volume, because it is different from most agricultural reports. As a rule, one has to hunt through such publications for something new or characteristic, but the trouble with the Connecticut report is that one has to hunt for things that can be left out. It is packed full of sound truths and bits of sensible advice—so full in fact, that after a struggle to pick out the best the reviewer is forced to conclude that they are *all best* and that the only sensible thing to do is to urge farmers to read the whole volume.

Those Connecticut farmers are good ones! They know how to farm and they also know just how to teach the principles of farming. Success to them!

STATISTICAL ABSTRACT OF THE UNITED STATES 1888.—This is the eleventh number of this publication. It consists of 230 pages of closely printed figures, giving the statistics relating to finance, coinage, commerce, immigration, shipping, postal service, population agriculture, railroads, etc., and is prepared under the direction of the Secretary of the Treasury. It is particularly valuable as the records are traced back for 10 years. The R. N. Y. is glad to get this book for it presents a basis for some very interesting figuring.

At the meeting of the National Grange held at Topeka, Kansas, last fall the following resolution was passed:

"*Resolved*, That the Commissioner of Agriculture be requested to inquire, through the consular system of Government or otherwise, what foreign nations are now importing agricultural products, and ascertain what possibilities there would be to establish trade relations for the disposal of our surplus agricultural products; also to inquire what agricultural products are now imported that our country and climate are capable of producing, and lay the same before Congress and publish for the information of farmers."

THE Statistician of the Department of Agriculture has just issued his answer, which is contained in the May report of the Department. Here are a few of his statements:—Europe is practically the only wheat market America can have, and Europe raises 1,200,000,000 bushels herself—more than half the world's crop and twice that of America. Europe imports an average of 144,000,000 bushels, of which America supplies 95,000,000. The demand for oats and barley from other countries is insignificant. We export 68,000,000 bushels of corn, all there is a demand for. We import more potatoes than we export. Only three European countries need to call on us for butter. These are Great Britian, Belgium and Portugal. We send 24,000,000 pounds. Europe calls for 140,000,000 pounds of cheese and we send 118,000,000 of it. We send to Europe 2,636,000,000 pounds of cotton. Europe calls each year for 780,000,000 pounds of raw wool. We produce only 80 per cent. of the wool used at home—importing the rest; 69,000,000 pounds. We send to other countries each year, 242,000,000 pounds of tobacco. The Statistician concludes that more cheese could be exported if its reputation for quality could be kept up. The same is true of butter. There is also a good demand for a good quality of dried or evaporated fruits. He also says we could save money by producing our own sugar, flax, hemp, and fruits

This is a very timely and important subject. It is well worth studying. The R. N.-Y. has made some careful calculations of its own, taking the figures as given in the volume under review. Our desire is to place side by side the values of our exports and imports for the past 10 years. The imports may represent what we have paid other countries for needed articles; while the exports may represent what we have sold.

Articles.	Exports.	Imports.
Eggs	$433,630	$18,841,283
Fertilizers	10,329,079	16,451,767
Bread stuffs	1,897,066,641	84,372,288
Flax, hemp, etc		113,249,874
Manufactures of Flax, hemp	16,122,570	226,093,369
Fruits	27,885,898	146,737,348
Hay	2,312,467	9,705,498
Hops	19,994,096	7,797,231
Meat and Dairy Products	1,138,549,203	17,189,652
Sugar and Molasses	70,468,422	818,644,110
Potatoes	4,011,018	13,581,096

These figures are interesting because they ought to show us the farm products that ought to be produced at home. It will be seen that our sugar bill is an enormous item. Can we make sugar here cheaper than we can buy it abroad? That is the question American farmers must answer. Fruits are a great expense to our people. We might produce most of them at home. Think of paying out millions for eggs! The most striking loss is in the production of flax and other fibers. We are importing nearly $250,000,000 worth of flax and hemp products. Cannot this money be kept in this country? Can we not build up the flax industry on American soil? Another point worth considering is the fact that during the past 27 years Americans have imported $407,747,416 worth of tea and nearly three times as much coffee. Have we not somewhere in our vast extent of territory some place where Americans can earn a portion of this money?

There are some startling figures in this remarkable volume. For example, we find that the American people, have consumed since 1870, 9,866,295,114 *gallons of wines and liquors*. This volume will be found extremely useful by those who like to investigate the growth of our country.

NEW YORK STATE DAIRYMEN'S ASSOCIATION.—SECRETARY JOSIAH SHULL, (Ilion, N. Y.) has issued a bulletin giving a strong argument in favor of dairy conferences. The bulletin states that "people are becoming more refined in their tastes, and more exacting about the quality of their food. This applies more especially to milk and butter, as these products are consumed, more or less, by every man, woman and child in our land. Instead of over-churned, over-worked butter, made from stale cream, that becomes strong, we want creamy flavored butter that is fresh."

The conferences are held so that people may come and see milk, cream and butter handled in the best possible way. The bulletin contains the following "Notes on Dairying." Most of them are as old as the art of dairying, but it is no exaggeration to say that a great many of these rules are still broken, by good people, too.

1. "The milk from healthy cows only, should be used.

2. Avoid excitement of cows, produced by chasing with dogs or in any other manner. Harsh treatment lessens the quantity and injures the quality of milk.

3. Cows should have an abundance of suitable food and pure water, and salt kept where they can have ready access every day.

4. Cows should be kept from all foul odors and not be allowed to eat or drink anything that will give taint to milk.

5. Milking should be done at regular hours, with clean hands, clean udders and clean stables, and the milk kept away from any contaminating odors.

6. Milk should be strained immediately after being drawn, and not be disturbed till creamed.

7. Milk pails and other vessels for keeping milk and cream should be thoroughly cleansed; first well washed and scalded with boiling water, and then aired to keep them perfectly sweet."

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

LAW AS TO SHEEP-KILLING BY DOGS IN OHIO.

T. M., Cuyahoga County, Ohio.—What is the law with regard to sheep-killing dogs in this State?

ANS.—If the owner of the dog is known and able to pay damages, a suit should be brought against him. In Ohio, the owner or owners of any dog that kills, worries or injures any sheep, lamb, goat or kid shall be jointly and severally liable to any person so damaged, to the full amount of the injury done, and the court or justice who has passed upon the case, shall declare the animal found to have occasioned the death or injury, to be a common nuisance and order the defendant to kill or cause to be killed such animal within 24 hours after the rendition of the judgment. If the offending dog has not been seen or if its owner is unknown, or if known, if the amount of the judgment cannot be collected on execution, then the person who has suffered injury or loss may present a detailed account of the injury done, with the damages claimed therefor, verified by affidavit, to the commissioners of the county wherein such damage was done, at some regular session or within one year, and shall make it appear to the commissioners upon the parol testimony of at least two other persons who are freeholders of the neighborhood where the injury was done, that the damage claimed is just and reasonable, that no part of the injury was done by any animal in possession of the complainant, and that he does not know whose animal committed the injury, or if known, that the judgment cannot be collected; then the commissioners, if satisfied that the account is just and correct, may allow the same, or such parts as they deem right, and shall order the payment thereof out of the fund created by the *per capita* tax on dogs. If such fund is insufficient to pay all such allowed claims in full, they shall be paid *pro rata*.

C. W. K., Los Gatoz, Cal.—A puts his young colt in B.'s pasture for a certain amount per month. He visits the pasture occasionally to keep acquainted with the colt, to see that it is there, and pay up to the date of his visit. After 15 months he goes to take his colt away, but it cannot be found. Is B liable for the loss of the colt, or for any damage? There is no charge that the colt was stolen, or had escaped, nor was there any agreement between the parties as to the safekeeping of the animal.

ANS.—If the colt was not stolen and did not escape; that is, did not get out of the pasture of his own accord, what became of him? If it can be proved that his disappearance was due to any action or want of proper care on B's part, a suit for the value of the colt will lie against him. If this cannot be proved, B cannot be held responsible, either in whole or part, for the loss.

T. M. S., Worcester, Mass.—A neighbor who owns land adjoining mine is going to build a large barn with adjoining sheds right up to the boundary line, with the eaves projecting over it so that all the water from the roof must fall on my land; what is the law in such cases?

ANS.—Building a barn or any other structure in such a way is a manifest encroachment on, or an appropriation of our inquirer's property to the extent, at least, of the projection; but a right to make this encroachment may be acquired by 20 years' acquiescence on the part of our inquirer. Any court of competent jurisdiction will issue an injunction forbidding the erection of a building in such a position, and after it is built, the court will order it pulled down or altered so as to prevent the drip from the roof falling on our correspondent's land.

CORNED BEEF AND CABBAGE.

WHEN ladies pack their furs away,
The seals and minks and sables,
And wear the linen and piques
And snowy lawns, with ribbons gay,
The market stalls present each day
A most bewildering array
Of early vegetables,
And they enjoy who have the means
Corned beef with various kinds of greens.

Mixed Wheat Seed

Shall We Sow a Single Variety?

M. DE VILMORIN'S VIEWS.

AMERICAN COMMENT.

An Interesting Discussion

LAST year the Mark Lane Express of England printed an argument by M. Henry L. de Vilmorin, head of the celebrated Paris firm of Vilmorin, Andrieux & Co., in favor of the sowing of mixed wheat seeds. The R. N.-Y. reproduced the following synopsis of M. de Vilmorin's views.

"It has been established by numerous experiments that the sowing together of two distinct kinds of wheat, gives almost invariably a better yield of grain than would have been obtained from the same total quantity of either kind sown separately; and, speaking of France, he says that skillful cultivators often employ mixtures of seed corn. In support of this practice it is remarked that each variety of wheat differs from all others not only in its external characters, but, to some extent, in the manner of its nourishment in its special needs, and in the proportions of the materials it draws from the soil—slight differences, it is true, and yet sufficient to exercise a distinct influence upon the yield. It has been truly observed in criticism of too thick seeding, that the most powerful enemy the wheat plant has to compete with, is the wheat plant itself; this is particularly the case if the plants which find themselves in strife, belong to the same variety, for the roots of each plant are continuously in contact with those of adjacent plants, which at the same time and at the same depth, are seeking in the soil precisely the same food. If, however, two different varieties have been sown together, the competition will be less severe for each. Another advantage of sowing mixed seed is that it yields in general, a grain of better appearance, and this is especially the case when a white or yellow grain is sown with a red one, or a soft-grained variety with one of which the grain is horny or polished. In this way is obtained what is termed upon the markets wheat *panaché* (*i. e.*,) variegated or mixed; ordinarily, these samples sell better than those of pure wheats."

The high reputation of M de Vilmorin will stamp these views as well worthy of consideration, however novel they may appear to American farmers. The R N.-Y. has therefore requested some of its correspondents to give their opinions on the matter. These opinions follow:

FROM PROF. J. W. SANBORN.

The principles involved in mixing different varieties of wheat, if the practice is wise, rest either upon all those sound and, as I believe, vital principles involved in crop rotations, or upon crossings that may occur by natural processes. Botanists seem to agree that wheats do not cross readily; indeed it has been held that they do not cross at all, but are self-fertilizers or, in other words, in-breeders. It has always seemed to me that our new sorts not artificially produced, are to be accounted for upon the principle called variation, or by some "sporting." I believe that cross-bred plants are more vigorous, and should it be that mixed grains result in crosses, these by virtue of their vigor would come to the front. But that such is the fact will not be admitted, nor is there evidence enough to support such a view. Among other good things that he has done the editor of the RURAL NEW-YORKER has shown the possibility of wheat crossing, and it has been shown by others also.

So far as the idea of rotation is involved, we certainly cannot claim much of the distinguishing advantages of rotation for M. Vilmorin's recommendation, for that rests upon principles involving the use of plants of other species and genera. The leading characteristics of different varieties of wheat must be essentially the same; that is, their composition, root area, time of ripening, the acids in their roots for soil solution, etc. It is probable that slight variations in those capacities and directions of development would amount to something. There are variations in the races of men and in the varieties of corn. The question occurs, however, would it not be better to select the variety the sum of whose good qualities is the highest? I see no field of probable gain save in the root action of wheat, the roots of mixed sorts more completely filling the soil and solving it in diverse directions; and then too there is a possibility of crossing. Of course, weak-strawed kinds would be supported by the stronger sorts.

I find that the millers raise no objection to such mixing of seed; indeed they mix the varieties in grinding. There is the objection that mixed wheat will not ripen together and that the tall sorts will shadow the shorter ones. This objection I regard as of some importance as there is a right moment for cutting the crop, which varies with each sort. This could be partly made good by harvesting the earlier sorts a little late. But even then we are confronted by the fact that wheat loses in weight after it has once become ripe, while yet remaining on the stem. Again, the more vigorous sorts of wheat must impair the growth of the less vigorous ones, as Darwin shows, occurs when two plants of diverse vitality occupy one pot. If the distinguished French seedsman rests his belief upon impressions, I should feel at liberty to doubt the value of mixing seed wheat unless crossing occurs, in which event I should be unqualifiedly for it. If M. Vilmorin has made an exact test of the matter, then I am in a position to accept his conclusions, for I have no controversy with facts and detest wise controversial speculations in their presence.

So far as informed, I should now select the most productive wheat that the millers will accept and that which is adapted to the soil I may have in hand. This wheat I would hold up as best I could by the most rigid course of selection. By this process as one of the factors, our entire wheat crop has averaged 39 bushels per acre for the last three years.

Columbia, Mo.

FROM PROF C. S. PLUMB

While I do not know how wheats are graded as to price in France, I do believe that the American farmer who grows mixed seed cannot compete in the home market with the farmer who produces a good, even quality of grain I certainly believe that Vilmorin's idea is more theoretical than practical, and for the following reasons:

1 My observation is that wheat cross-fertilizes very sparingly, hence the results through this medium would be immaterial.

2. Some varieties of wheat are of entirely different character, in maturity, hardiness, size of plant, etc Now, the more the extremes are mixed, the more uneven the sample would be. If a late variety be sown with an early one, the latter will be ready for cutting before the other is fit. If a variety that rusts badly be sown with one quite free from this malady, the former may help break down the latter in lodging. But, assuming that two varieties that are quite closely connected be planted, it seems to me that the more nearly these varieties resemble one another the better for the grower.

3. Patrick Shirreff, of England, was probably the most skillful theoretical and practical wheat culturist in the world. His policy was to breed up one variety, and by that means, pursued for many years, he produced a variety of wheat that brought the very highest market price, and his wheat became world-famous.

4. The miller desires the cleanest, evenest, plumpest grain he can get. The more closely all the grains a farmer delivers resemble one another, and approach or excel a certain mercantile standard, the nearer he approaches the highest market price.

5. In reference to the roots of different varieties of wheat seeking food in the ground, I seriously question if there is a man living who has the data at his command to show that the healthy roots of one variety will seek any different chemical food from that sought by the roots of another equally healthy plant of another variety. This must be simply theory, for it is now positively known that the roots of the wheat plant penetrate much deeper in the soil than was thought up to a very recent date.

Though we have a vast number of names of wheats, it is my opinion, based on considerable field work, that of distinctive varieties we have but comparatively few. I advocate crossing varieties by artificial means, thus attempting improvement. However, if we would have the best wheat, we must grow it on land that is rich in plant food, and adapted to that plant. If our wheat deteriorates, I do not believe it the fault of the variety; in all probability it is owing to deterioration of the soil, caused by starvation treatment.

Univ. of Tennessee.

FROM F. P. ROOT.

The mixing of different varieties of grains in the growing of a crop is claimed by many to be advantageous in the yield, and also, in many cases, in the quality of the product. It is a theory and also a practice not new in this Genesee valley, a noted grain-growing section from the earliest days of its settlement. Fifty years ago and upwards, following the practice of my father, who was a very successful wheat grower, I grew mixed wheats exclusively for several years. The two varieties grown together, were the White Flint and the Red Chaff Bald, and also a white wheat. The gain claimed was that a surer and better yield was usually obtained because the former was a more hardy and stronger-growing variety and the latter a more prolific yielder with stronger and coarser straw, which aided to hold up the flint variety which was liable to fall on a rich soil. This practice of mixing varieties of wheat was quite common in this section for several years; but it gradually disappeared on the introduction of other improved varieties of grain but the practice of mixing varieties of seed in wheat growing is by no means absolute at the present time; for in our market at Rochester, regular quotations are given for mixed, as well as for pure varieties of wheat. It is claimed by some theorists that different varieties of wheat draw from the soil different elements of plant food, and hence two or more varieties may be grown together with less exhaustion of some elements of plant food than when but one is grown. I think, however, that this is rather a slender basis on which to base an argument in support of a theory, for the differences in the elements contained in different varieties of wheat are very trifling; but there may be at times some practical benefits in this theory, like the following: One variety may grow a stronger fibrous root, and hence it will resist heaving by the frosts of spring better than another which is more prolific and less hardy, and when these two are sown together, if the weaker one fails, the stronger may not fail. It may be asked, then, why not sow the stronger variety altogether? The answer is, that the choicest varieties of wheat, such as are the most desirable in market, are, as a rule, less hardy in resisting the casualties of the growing season than the coarser and less desirable sorts. Again, when one variety grows a taller straw than another, the heads are less crowded and a better circulation of air and sunshine is obtained at ripening time and one variety that grows a very stiff straw may hold up another that grows a weaker straw, but which is more prolific. After considering all these trifling benefits to be obtained from a mixture of seeds, I think it tends to negligence and carelessness on the part of the farmer in procuring the best and purest seeds, which is of far more importance than the fancied benefits of mixing varieties. Mixing seeds is quite too common among a large class of farmers, such as mixing rye with wheat, chip, cockle, quack, red-root and many other noxious seeds, much to the damage of the crop and of the farmer. In general, the farmer who takes pride in having clean and pure varieties of wheat, oats, barley, corn, potatoes, etc., is the best farmer and will be more successful in his business than the one who gets things mixed in his crop or in his head.

Monroe County, N. Y.

FROM PROF SAM'L JOHNSON.

I have had no experience in the sowing of mixed wheats; but from the well-known reputation of M. DeVilmorin, I should think his statements worthy of careful consideration. It occurs to me that not much stress should be laid upon the theory that "the different varieties of wheat differ from each other in the manner of their nourishment and in the proportion of the materials they draw from the soil." These differences must be so slight, if they exist at all, that it seems that we must look elsewhere for the reason of an increased yield, if such is the result of sowing several distinct varieties together. Without speculating further upon the reasons given for this practice, I shall be very glad to note this as an interesting question for investigation in our experimental fields.

In this connection I may add that in a conversation on grain-growing with Regents Hiram Smith and H. D. Hitt, of the University of Wisconsin, the latter gentleman informed me that he had sown spring wheat with his oats last spring, and that it was a common practice in his vicinity. It was there claimed that without any diminution in the yield of oats, often 10 or 12 bushels of wheat per acre were obtained from this sowing of mixed oats and wheat. Peas and oats are often sown together, the latter serving to hold up the peas and prevent them from lodging so that they fill better, giving an increased yield, while a fair return of oats is secured. The amount and kind of food elements taken up by these different grains differ more or less in kind and in degree, and this would indicate why the practice might prove profitable under certain conditions. (Mich. Ag. College.)

FROM PROF. E. M. SHELTON.

I think well of the suggestion of sowing mixed varieties of wheat together, provided, of course, the differences between them are not too great. Besides the advantage of having wheats that feed differently growing together, as suggested, the fact that they ripen at different times would be quite likely to prevent their "lodging" in many cases; and it would not be unlikely that the danger of complete destruction of the crops by insects would be averted. The practice of growing mixed grain crops for stock feed is an old one. In England mixed oats and peas are a favorite crop with stockmen. In this section of the Great West, millet or Hungarian is quite commonly sown broadcast with sorghum, the resultant crop being a very heavy yield of curable and highly nutritious fodder.

Kansas Ag. College.

FROM COL. F. D. CURTIS

The plan of M. de Vilmorin has the merit of novelty. I fail to see how one wheat plant will or can assist another in its growth. A coarser or ranker wheat would, of course, send its roots down deeper into the soil; but how this could add to the yield of the more delicate or lighter-growing kind is not apparent. It is, however, plain to me that the underlying plants would rob those feeding nearer the surface of moisture and plant food, just as trees unfit a plot of ground for the production of other vegetation wherever their roots fill the under strata of earth. If these wheats did not flower at the same time there would be no stimulus to production, nor would there be any hybridizing of peculiarities If wheats of different character were sown, and both threw off their pollen at the same time, there might be a mixture, and perhaps a mottled wheat as the result of the combination or union of different colors. The new seed would have a future, being perhaps in part like one parent and perhaps in part like the other: or it might be mostly like one. The idea is interesting for the sake of the amusement it may cause, and testing it in practice will help to multiply kinds; but in the trial crop each kind must depend on the characteristics it has received by heredity. There is no nerve force or magnetic power to be absorbed or borrowed. I have often planted corn in this way, and the result was mixed kernels in the ears, but I have never noticed that the lesser stalks were made greater, or that the larger were magnified; each followed its own bent.

Saratoga Co., N. Y.

Dairy Husbandry.

FARMERS' PROSPECTS IN ENGLAND.

PROFESSOR J. P. SHELDON.

All-round improvement in stock-raising prospects due to abundance of forage and shortage in cattle and sheep; prices greatly increased; of late milch cows have paid best; good prices for milk, butter and cheese; arable farming still depressed; the check to agriculture likely to be permanent; other industries reviving; great advantages of American farmers.

SO FAR as stock-raising, grass-land farmers are concerned, there are several points this spring in marked contrast to the spring of last year, as indeed there were between last fall and the one preceding it. These changes, on the whole, are improvements, and people are in better spirits than, perhaps, they have been during any other year in the current decade. There is a large, all-round increase in the value of the live stock of the farm, and this is owing to two prime causes—the one a favorable and the other an unfavorable cause. The first of these is found in the plentiful surplus of forage which is now left unconsumed on most farms, as compared with the great scarcity of it which prevailed a year ago; the other is the serious decrease which has taken place in the number of live stock—that is of cattle and sheep more particularly. Our national agricultural statistics are collected on the fourth of June, each year, and they form a valuable guide to the comparatively small but increasing number of farmers who take the trouble to study them. On June 4, 1887, we had in Great Britain a total of 6,441,268 cattle, of all ages; and of sheep, 25,958,768. During the succeeding twelve months, these totals had gone down to 6,129,375, and 25,257,-149, respectively, showing a decrease of cattle amounting to 311,893, and of sheep to 701,619.

This diminution in numbers is owing mainly to the dry summer of 1887, in which all kinds of crops were very light, and which caused the slaughtering of a vast number of half-fat cattle, to save the cost of wintering, and to make up the supply of beef required by

the people. This supply was diminished because fattening cattle did not attain the size and weight they ought to have done, by a good deal, and it was not made up from American, Canadian and foreign European sources. The price of beef increased a little in the autumn of that year, instead of diminishing as is usually the case; and this increase in value of beef, coupled with a very short supply of grass and roots, caused a large number of cattle to be sold to the butchers, which

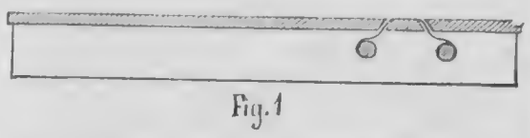

Fig. 1

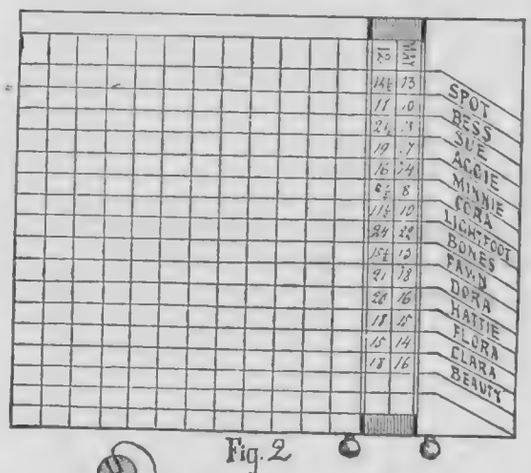

Fig. 2

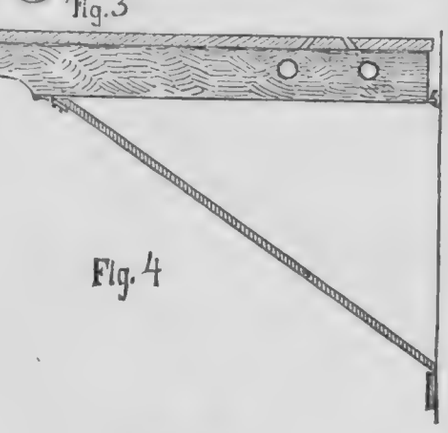

Fig. 3

Fig. 4

Fig 143.

would otherwise have been wintered. As it was, however, many districts had difficulty in wintering their remaining cattle, and hay went up to $30 and $35 per ton, and straw up to $25, in the spring of last year. I have never known cattle so low in price as they were in the fall of 1887, and though they did not improve in value in the following spring as much as might have been expected, still they paid very well for the wintering, to those who had forage enough of their own without buying. The summer of 1888 was a wet one, and crops were abundant, while cattle were much diminished in number, so that in the fall of 1888 bovine stock were worth 60 or 70 per cent. more than they were a year earlier.

During the last winter, cattle have not paid for wintering, save cows in milk. All other sorts of store stock have for the most part been wintered at a loss, although they are now worth $15 to $20 more than they were this time last year; and this illustrates the great increase of value which took place between the spring and fall of last year, and the still greater increase between last fall and the one before it. Calving cows are now worth up to or over $100 each for good specimens; they may, in fact, be said to run from $70 to $100, in round figures. Barren two-year-olds are worth $40 to $60, yearlings from $30 to $40, and heifers and cows $60 to $80. Sheep have advanced correspondingly in value, for yearlings are worth $8 to $11 each, and mutton 16 to 20 cents per pound, while the top price of beef remains at about 16 cents.

Here we are, then, with a greatly diminished stock of cattle and sheep, and higher prices corresponding thereto, or resulting from it, I should say. A great deal of forage is left over from last winter, and we are having an early, grassy spring. The milk trade, owing to scarcity of cows, has improved, and stock-raising promises to pay well for at least two or three years to come. Cheese is worth eight to 12 cents, and butter 20 to 24 cents per pound, with good promise of an increase at all events in cheese. It will therefore be perceived that our dairy farmers' prospects are a good deal more cheerful than they have been for many a long year of weary depression. Sheep farmers, too, have reason to be more hopeful, though wool remains, and is likely to remain, low in value. Our arable farmers, unfortunately, have no such reasons for jubilation, and are not at all likely to have, I fear; and so it is that more land is each year being laid down to permanent grass; and the soil of Old England is going more and more out of cultivation, out of deference to the great grain-raising regions of the New World on your side of the Atlantic.

We are slowly emerging from the period of depression which set in 10 years ago in real earnest, but it cannot be doubted that British agriculture has received a check which will not be wiped out, probably, in this century. The trade of the country is again improving, manufacturers are busy, new mills and workshops are being put up in hundreds, and population is increasing rapidly, and we have no virgin soils, as you have, to feed our people from. So long as our commerce continues to expand the old ship will float on bravely enough; and it may help us somewhat if the foolish nations on the Continent fly at each others' throats again, as they most probably will before long—and we keep out of the rumpus. All the same, however, we may well envy you, far removed as you are from the feuds and hatreds of race and country in Europe. Fortunately for us, we are removed from them by a silver strip of sea, narrow though it be; but you are removed by the wide Atlantic, and may pursue your magnificent development in peace and absolute security. To farm in England is better than to farm on the Continent of Europe, but not so good as to farm in America, so far as prospects are concerned.

Surrey, England.

UTILIZING THE STRIPPINGS.

L. S. HARDIN.

The old Kentucky method of saving the strippings; city milk suppliers make butter of them; strippings the richest part of each milking; the reason for this; comparative richness of the morning's and night's milk; discussion on the matter,

I am asked to tell readers of the RURAL what I know about "strippings," and how they are treated by those who supply city milk routes. My earliest recollections of farm life recall the practice of our Kentucky negro "mammas," who did the milking and always carried a large quart cup to the cow-yard. Their practice was to draw about three-fourths of the milk into the large cedar bucket and then finish the milking into the tin cup which was emptied into a pail reserved for this purpose. These strippings were poured directly into the cream jar, while the other part of the milk was set for the cream to rise in old-fashioned glazed crocks.

This method of saving the last and richest portion of the milk for butter-making is still practiced as a general thing by milkmen who supply town routes. There is, however, an exception to this rule and it comes about in this way. Every milkman makes his contracts for delivering milk nearly up to the maximum supply of his herd, always leaving

Fig. 144.

a margin for meeting an extra demand for milk. When this demand arises he of course puts in the strippings, and, if his conscience is not too tender, a little water to keep the milk from being too rich. When this extra demand falls off he reserves the strippings once more and makes butter of them, at the same time selling the buttermilk. It is of course impossible to keep the supply of milk and the demand of the customers exactly in the same proportion, so that there must always be a margin of extra supply to meet emergencies, and this extra milk must be turned to profitable use, and no better method has been found than to make butter of it. This can best be done by holding back the strippings, even though doing so lowers the quality of the milk supply, which does not usually trouble the milkman very much. The extra demand usually comes in hot weather, when bar-rooms and babies take an extra supply along with berries and ice-cream. At that time there is apt to be dry weather that injures the pastures and produces flies, all of which tend to cut short the milk supply.

There has been a good deal of scientific discussion of late years as to whether the milk drawn in the morning or that drawn at night is the richer and the whys and wherefores of it, but I believe there is no dispute about the fact that the last part of the milk drawn from the udder is much richer than the first part. The old theory was that the cow had already created the milk and held it in completed form in the udder and that the richest part being the lightest, kept at the top of the udder, while the watery part being the heaviest, descended to the teats and was, of course, the first to be drawn by

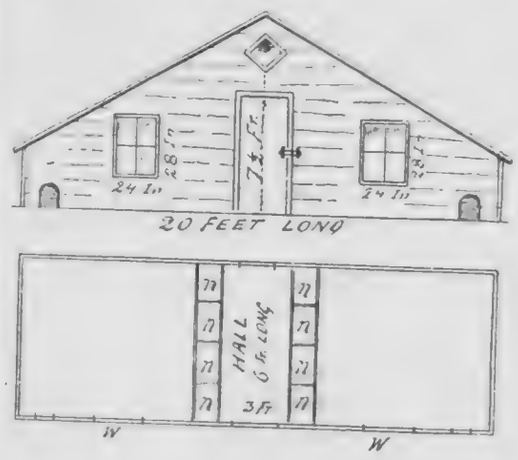

Fig. 145.

the milker. This fact that the richest milk comes last is a severe stumbling-block in the way of the new theory that the bulk of the milk is created by the cow during the act of milking. How this fact can be reconciled with the new theory I do not see.

To go back to nature: we know that the cow's milk is intended for the support of the calf; that while the calf is very young it needs milk comparatively poor in butter fats, and as it grows older it needs more fat. To meet this demand we find that the milk of all cows grows comparatively richer as they progress from the time of parturition. These two conditions seem to meet the exact requirements of nature; but why the last of each individual milking should be richer than the first part is still unaccounted for. It may be that nature reserves the creamy portion for the finishing part of the calf's meal as a sort of dessert to quicken the appetite and induce it to suck the cow dry for her benefit, which is certainly a good thing for her.

If my recollection serves me aright, all well authenticated experiments prove that the morning's milkings are always not only the largest but the richest, a circumstance that goes to prove that the night's rest is conducive not only to the production of a greater quantity but of a richer quality of milk. We know that exercise of the cow tends to lessen the supply of butter fats in the milk. Even the swinging and kicking of the lower part of the udder as the cow walks, may have considerable effect in lessening the amount of butter fats in that part of the udder.

This, of course, is only guess-work, but it is the best one can do until science definitely settles the question. I have known cows that gave almost pure water from the teats at first, while the last milk drawn would form clots of butter on the sides of the pail. It looks very much as though gravitation had more to do with this than anything else. The fact remains, however, whatever the theory may say, and is within the knowledge of every dairyman that the last half of the milk drawn contains at least two-thirds of the butter fats of that special milking, and all dairymen have long since learned that if any portion of the milk is to be retained for butter-making the last third is the part for them to hang on to. This is usually done in town dairies by the milker first taking two-thirds or three-fourths, as the case may demand, of the milk from four or five cows, emptying the bucket into the wagon can and then returning and milking those cows dry, and pouring that milk into the can that stays at home. This custom may not reach a very high plane of morals, but it is strictly business.

KEEPING A MILK RECORD.

I HEREWITH send the RURAL some sketches of a device (see Fig. 143) in use at the University barns for keeping records of the milk of individual cows. The idea was obtained from a similar device illustrated in a bulletin from the Minnesota Experiment Station, and used for recording the data of feeding experiments. It consists of a box a little wider than the paper to be used, in which are two rollers about the size of curtain rollers, shown in section in Fig. 1. The paper used is ruled both ways, and is fastened to the rollers by a long stick which fits into a groove cut in the roller, as shown in Fig. 3. Between the rollers the paper passes up and over a narrow board or stick, where only a very narrow strip of it is exposed. Two lines are used for each day's record: one for the morning and one for the evening milking. Fig. 4 shows a way of hanging the device against the wall where a table is not used; when not in use it is let down against the wall. J. M. D.

Cornell University.

The Poultry Yard.

PLAN FOR POULTRY HOUSE.

THE poultry house shown at Fig. 145, is arranged for two breeds. It is 20 feet long, six feet wide and 7½ feet high. The lower end of the roof is 2½ feet from the ground. The house faces the south, and the interior is lined throughout with tar-paper to make it warm and keep it free from insects. It contains a hall with a room on each side. Each room is lighted by a window 28x24 inches, three feet from the ground. The roosts are even with the windows, and the drop-boards are eight inches below. The nests are below the drop-boards, and can be easily reached from the hall by simply turning a wooden button and letting down a door which extends the whole length of the partition, as seen beneath. The hall is three feet wide and six feet long, and contains two small ventilators, one above the door and the other at the opposite end of the hall. The partitions that inclose the hall extend almost as high as the door, and are so constructed that they can be readily removed. This plan is very simple, and the house is easily constructed, and combines all of the conveniences possible in so small a space. C. R.

Richmond, Indiana.

A DAKOTA POULTRY HOUSE.

MR. C. W. FABER, of Potter County, Dakota, has a house for his hens like that shown at Fig. 144. A shows the shape of the house and the small window in the roof. B shows the interior; a a a are nests; c c c are roosts and b is a water fountain. C is a door also shown at the top of the cut. This house can be made of any desired size; Mr. F.'s house is six by eight by nine feet. This, he thinks, is amply large enough for 15 to 20 Black Spanish hens.

Rural Topics.

MACHINERY IN THE HAY FIELD.

PROFESSOR A. J. COOK.

Defence of the hay tedder; instance of its advantage; in favor of the hay loader; how it is used.

I WAS much surprised to read the article by Prof. I. P. Roberts in a late RURAL NEW-

Fig. 146.

YORKER. His opinion cuts so directly athwart my experience and the opinion of some of our best Michigan farmers, that I cannot well understand it. No one can doubt Prof. Roberts's ability or candor, and the only possible explanation I can offer is that he either had poor machinery, or else the latter was run by incompetent men. The latter suggestion could not apply to Prof. Roberts, as he is a most cautious person and a natural mechanic.

1. "Hay tedders are too expensive for most farmers, considering their liability to get out of repair and the little time they are in use. Then, too, unless they are used with the utmost judgment, they seriously injure the quality of the hay."

In reply, let me say that I value the tedder very highly. I have used mine now for several years and it is still in excellent condition,

practically as good as ever. All farm machinery must be cared for and used carefully. Thus treated, the tedder is durable, as my experience plainly shows. The theory of my boyhood was that the best hay was always cured in the windrow or cock. My experience is that time, expense, safety and excellence are all best secured by the free use of sun and wind, and, I may add, of the tedder.

I never saw better hay than we secured last year. We cut it as soon as the dew was off. As soon as wilting commenced we set the tedder at work; but stopped its use before the hay was dry enough to break. Usually by two o'clock—last season was very dry—we could commence drawing. Now how quickly and easily is all this done. The hay is in the barn the same day that it is cut. There is no risk from rains, no expense of caps, raking or cocking. We like the style; and this method demands the tedder.

The next sentence in the Professor's article is entirely at variance with our experience. "Hay loaders even at the best, can hardly be recommended for general use." I am glad their special use is not interdicted; as we should hardly know how to spare ours. Michigan is much like Western New York, and I know that the loader is a grand success in Michigan. I can't help wondering if Professor Roberts has used the Keystone or seen it used.

My attention was first called to the loader some years since by our excellent Governor, C. G. Luce. He told me that he valued it very highly. Soon after I saw one of our best farmers, Mr. Sower. He said he would almost as soon give up his mower as his loader. But said I, "Is it strong and durable?" "I have used mine," said he, "several years and it is as good to-day as ever." I bought the Keystone loader, and it is a very substantial aid. Haying on my farm is now changed from the hard, tedious, anxious work of the past to the easy, quick, pleasant work of to-day. My men like haying as well as any work of the farm. We commence with the loader at about two o'clock, taking the hay without raking, just as it was left by the tedder. If we have only one man to load, he has to work lively. By the use of slings unloading is also quickly done. Thus by the use of that grand triumvirate, the mower, tedder and loader, we save an immense amount of hay in a day in the best condition. In case we have heavy clover—which we have not had since we have used our loader—perhaps we could not work so rapidly unless we had very close bays or used the silo. Just before night we put on the rake, and go over all the ground This rakes up any left by the loader or that has been dropped from the load; and this is still green, bright, and unbleached. The last load taken is from the small windrows formed by these rakings. Last year we had no use for the rake except to do this clearing up. We have never done our haying with anything like the satisfaction which we received the last two years; and the whole difference came from the use of what we pronounce the admirable Keystone loader. Thus it is that when I see so good a friend receive the black e , I feel like stepping to the defense, even if the person who deals the blow is greatly my superior in both knowledge and experience.

Miscellaneous.

WHAT IS TO BE THE OUTCOME?

T. D. CURTIS.

Dangers of monopolistic combinations; violent and peaceable methods of riddance; national co-operation to supersede monopolistic co-operation; all large undertakings of a public character to be under government control—run by the people for the people, not for a few plutocrats.

I HAVE been much interested in the series of articles contributed to the R. N.-Y. by Prof. W. I. Chamberlain, of the Iowa State Agricultural College, on the subject of monopolies. He is a square, outspoken man, and presents the subject in a forcible light. But it appears to me that no legislation yet proposed promises a radical remedy for the stupendous evil of the day from which we all suffer, while through it a few become millionaires—a class unknown before the war of the rebellion.

"Men may come and men may go," but must this evil, like Tennyson's brook, "run on forever?" Is it a possible thing that evil can be pursued indefinitely? Or will there come a limit to the career, reaction set in, and the opposite extreme be reached, bringing annihilation to the evil and destruction to those who have been its devotees? I believe every evil, in the end, brings its own remedy, and that every wrong must be righted. The pendulum is not truer to the law of gravitation than justice is to the law of equity. Action may have a narrow or a broad sweep, but the reaction will correspond. Though it may continue for a while after the equilibrium is broken, the return is as sure as that of the pendulum when it moves beyond the line of gravitation.

What is the cause of the present co-operative movement on the part of each industry? It is the reaction from the old competitive system, which has brought us down to shoddy, adulterations and cheats and swindles of all kinds, for the purpose of securing a profit from the consumer. It is co-operation on a narrow base for monopolistic purposes. Every combination has the same end in view—to get rid of competition in its own ranks, and to compel the general public to pay whatever is demanded. In some cases, it may even reduce prices to the consumer; but prices, sooner or later, are sure to go up. The different combines will be so many organizations for fleecing the public, and each will want to get the biggest share of the fleece. So each will gradually move to put up prices, and the roar of the giants will begin. Instead of competition in detail, we shall have competition between the organized industries—all scrambling to get the most of what there is, regardless of the consumer and the toiling and producing millions, save so far as they can be made a source of dividends.

But there is a limit to the burden-bearing capacity of the camel's back. The last straw will come at last. Then what? I shudder to contemplate the answer. But let us hope it will be a peaceful solution of the trying problem. I can imagine leaders among the trusts wise enough to listen to the voice of reason and humanity, and to submit to the demands of the public welfare. I can imagine the people made wise enough through experience and suffering to drop all party politics, turn their backs on the demagogues, and to demand through the ballot-box such an administration of the government as shall secure the ends of justice and equity. And I can imagine a much more fearful conclusion. But I hope for the best.

What shall be the remedy? All palliative legislation will fail; and there is no sense in legislation which public intelligence does not indorse, and public sentiment will not see enforced. Premature legislation, however just, would retard instead of helping reform. But it is likely that many ineffectual measures will be tried before the people will clearly see and demand the true one. That I conceive to be *national co-operation.*

At present, the best service which the people get is the postal. This is run by themselves through their government. They must take possession of all railroads of the country, and build as many new ones as may be needed, as a part of the postal system. It must carry passengers and freight, as it does mail matter, at bare cost and the expense of repairs. They must in conjunction with these, take the telegraphs and telephones. The mining and other public interests must be assumed and run in the name of and for the people—and so on, as far and as fast as the public demand and the necessities of the case will permit. These being already organized under trust management, they will be ready to be delivered up to the people. The same officers may continue to run all these industries and the same operatives, with others, may continue to be employed. But the officers will work on salaries and the operatives will be paid equitable wages as government employés. The transfer and transition from competitive co-operation to national co-operation will be natural and easy. The system once begun, its extension will readily follow. Other nations will be compelled to imitate our example, national co-operation will prevail, and then competition will equalize the condition of humanity throughout the world. It will do then to begin to talk about the coming of the millennium.

CORRESPONDENTS' VIEWS.

POTATO YIELDS.—I have followed with interest what has been said about the RURAL'S potato contest, and I think it has done remarkably well, considering the unfavorable season. The weather here was so dry in the fore part of the summer that the growth of our potatoes was checked, and then they made a second growth when the rain came. Then the weather became so wet that we had hard work to secure our crop. The largest yield of potatoes I ever had was 220 bushels of Early Maine, 60 pounds to the bushel—from two barrels of seed. The land had been in early cabbages the previous year, and had been manured with 80 Scotch cart-loads of rotten barn-yard manure to the acre. No manure of any kind was applied to the potatoes. I planted in rows 30 inches apart, 10 inches apart in the row. I tried the trench system with one peck of Puritan potatoes. The land became so dry that it fairly cracked. There was a fine growth of vines, but not many tubers. I applied rotten manure—a complete fertilizer for potatoes—and hard-wood ashes, and only had three bushels of tubers. Perhaps some other variety would have yielded better. I generally grow from 15 to 20 acres of potatoes. I notice that where I do not hill them up with a drill or shovel plow they are apt to grow out of the ground and get sunburnt. Some varieties, like the old Garnet Chili, produce their tubers deep in the ground, while those of the Early Rose type grow near the surface. One implement we use extensively in this vicinity is a potato separator. With it three persons can easily bag 200 bags per day. It puts the large ones in a bag and those of medium and small size in separate boxes, and the earth falls from the potatoes into a box underneath. I also use it for sorting onions. R. B.

Montreal, Canada.

NEVER KEEP HENS FOR EGGS AFTER MOLTING.—There is one thing in regard to the poultry branch of farming—and with the majority of farmers this branch is essential to a well regulated establishment—that I will not be caught doing again: I will never be caught keeping hens over the second year, for I have decided to my entire satisfaction, that it doesn't pay to keep them over the molting period for the purpose of laying eggs the following season, unless they are very valuable for breeding purposes. It is far more profitable to kill them off as near molting time as possible, and depend on early-hatched pullets for the winter supply of eggs, and on later hatched ones for eggs during the rest of the season. Many farmers have a hobby; all should have *one* at least. I believe I have two for a certainty—one is raising potatoes and the other raising chickens. I find both very interesting. A. P. A.

Meadville, Penn.

Farm Economy.

DEVICE FOR RELIEVING A CHOKING COW.

(*See page 379.*)

AT Fig. 146 is shown a device for removing a potato or other obstruction from the throat of a cow. I have used it several times for this purpose, and know that it does the work well. Take about eight feet of common pail bail wire; double it in the center and make a loop of about one foot by two inches. Twist the rest of the wire so as to form a handle. If the obstruction in the animal's throat is loose when this is inserted, it will push it down; if it is not loose, the end of the loop will slip past it, and the obstruction can be readily pulled out in the loop. Lowell, Mich.

Everywhere.

RURAL SPECIAL REPORTS.

Kansas.

PARSONS, Labette County, May 17.—The weather for this month has had no precedent in Kansas. Commencing Sunday May 5, the wind blew without intermission from the fifth to the ninth, making 120 consecutive hours at a speed varying from 25 to 40 miles per hour. Since the ninth the winds have not ceased and have attained velocities ranging from 15 to 30 miles per hour, with a few gusts of 40 miles which toppled over smoke-stacks, and slight barns. The water-fall has also been peculiarly liberal. During the month we have had heavy rains every five or six days which were so nicely timed that no serious disasters occurred. But the farmers are having a poor time in their attempts to raise a crop of corn. No sooner have they been compelled, as it were to plow, cultivate, and plant, than another down-pour occurs.

Every fifth or sixth day a rain occurs. The rain-fall this month, so far, is not less than eight inches, which is nearly one-third of the average rain-fall for the year. In spite of these obstacles to progress, the usual amount of planting and replanting has been done and farmers are not faint-hearted.

Wheat, oats, etc., are fine and the chinch bugs must be exterminated if water can do it, Grass is good and stock is healthy and doing well. One of our farmers lost 19 fine steers by one stroke of lightning. Fruits of all kinds promise well, especially the small kinds. Canker-worms have done general damage to the apple trees. They disappeared before our big rains occurred. It is supposed by some that the mild winter allowed the pests to survive more generally than usual. Corn stands now from one to eight inches high. Merchants complain of bad trade, and it is not surprising when the cholera takes the hogs one season, and corn brings 22 cents the next one.

J. B.

New York.

MEDINA, Orleans County, May 21.—Our leading and most popular apple, the Baldwin, is entirely a failure in Orleans and Niagara counties. There is a prospect of a fair crop of Greenings and other apples. The peach crop is almost a failure. We shall probably have a few for home use, but none to ship. Every indication points to a large crop of pears, plums, cherries, quinces, etc. The season is very forward—at least two to three weeks ahead of the average. Wheat and spring crops are looking well; corn is being planted, and everything, except prices, looks as if this would be a prosperous year for farmers. C. S. M.

Virginia.

WARE'S WHARF, Essex County, May 23.—Farmers are fully one month behind with plowing and planting. Wheat is promising; oats do.; clover extra good. Peas are now being shipped to Baltimore and canned here, most raisers contracting for not less than $1.50 per barrel at the canning-house; the crop is short owing to so much rain. R. L. W.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

COWS OR SHEEP.

"*Young Farmer,*" *Mercer County, Pa.*—"Which will pay me better, to keep cows and sell the cream, or to keep sheep? Prices here last summer were as follows: Lambs, five cents per pound; mutton four cents; wool 30 cents; stock ewes $3 to $4 each; good cows from $35 to $40; cream per gauge, January, 24 cents; February, 23–24 cents; March and April, 23 cents; May, 20–22 cents; June, 14–16 cents; July, 12–15 cents; August, 15–16 cents; September, 18 cents; October, 18–20 cents; November, 20–22 cents; December, 22–24 cents. I have a few high-grade Jerseys and I could feed skim-milk to hogs which bring six cents dressed. I have about 150 acres of cleared land with good barns"

ANS.—This question has been referred to a number of our correspondents. The replies from those who care to offer an opinion are given below. It is very hard to give advice in such a matter, because it is evident that an answer that would apply admirably to one man or one farm might not fit at all in case of another man or another farm. There are men who take naturally to the care of sheep, who might not succeed with cows; while others, perhaps, like to handle cows but would fail with sheep. Again, some farms are naturally adapted to dairying, while others actually need sheep. All these facts have to be considered in answering such a question.

FROM C. R. BEACH.

Any man who has the ability to manage a flock of sheep or a dairy of cows successfully, can, with the aid of a slate and pencil, answer those questions for himself much more correctly than any one who does not know him or his surroundings, and if he has not such ability the most exhaustive and philosophical answer will be of no help to him. I will only add that with a dairy of well-bred and well selected cows, properly fed and cared for, he has no business to sell cream by the gauge, for he will be cheated every time.

Whitewater, Wis.

FROM W. P. PRATT.

I can give no facts or figures different from those published in the RURAL NEW-YORKER January 19, never having had much experience in selling cream, nor of late years a great deal to do with sheep. Barring the closer confinement which the dairy enforces all the year round, my "theory" would be

that selling either cream or butter would be more to his advantage and that of his farm than raising sheep. A few sheep may be advantageously kept; but to devote his entire area to sheep grazing could hardly be wise. A great deal is published in favor of sheep husbandry as a mode of enriching land, keeping down weeds, etc., but my general objection to fully stocking a farm with sheep is that they "bite too close," killing out not only the weeds but the sweet grasses, compelling frequent cropping to the ultimate impoverishment of the soil. Especially is this true in soils naturally thin and already worn, where thistles, white and yellow daisies, etc., etc., have become as it were indigenous. Sheep will kill out on such lands a fresh seeding every two or three years, thus giving to the noxious growths full swing, for which the plow is the usual and necessarily often-applied remedy.

Steuben County, N. Y.

FROM EDWARD VAN ALSTYNE.

I would say to this inquirer that if he can keep only one kind of stock, let him keep cows. I do not know just what he means by a gauge of cream, as the milk would vary with the different modes of setting. I have therefore figured on 15 cents per quart which is the ruling price in New York State, many getting much more. Eight sheep at $3.50 per head cost $28; but he can scarcely keep eight sheep and their lambs where he could keep one grade Jersey cow. From eight sheep he ought to raise that number of lambs, which if they weigh 80 pounds will bring $4, or $32 for the eight, at five cents per pound. They should shear five pounds of wool each, which, at 30 cents per pound, will bring $1.50 each, or $12 for the lot, making the gross sales $44. Taking a little more than his average price for a cow, viz. $45, he would have to invest more capital in the cows, but the profit would be enough greater to make up the difference. An average grade Jersey ought to give 400 quarts of cream, in 300 days (an extra-good one will give 450 to 500 quarts), leaving 65 days for standing dry, which is too long a period; 400 quarts of cream at 15 cents per quart would bring $60; and the skim-milk, worth from $10 to $15 more, can be fed not only to hogs, but to calves and poultry as well.

The labor would be more with the cows, the amount of manure made would also be greater, but it would not be so valuable as that of the sheep. On his cleared land he should practice soiling, and have a silo, whereby he can keep many more cows on the same ground, than by the old way of pasturing and hay raising. On an average farm I recommend and practice keeping both cows and sheep.

Columbia County, N. Y.

FROM C. H. FLETCHER.

If I should figure out the question on the basis of this or last year's prices, and say that cows would pay better than sheep; suppose dairy products go down and sheep and wool go up, that "young farmer" would soon find that the sheep were paying the best, contrary to my figuring. In fact, the cow might pay me the better of the two, while the case might be the reverse with another. A great deal depends on the adaptability of one's farm. It may be especially adapted to either dairying or sheep husbandry, or both. If it is low, flat, damp land and not well drained sheep will not pay. These animals require dry, hard ground for pasturing; low, wet ground is conducive to most diseases prevalent among them; besides, the grass grown on low, damp ground is not as sweet or as well adapted to promote a healthful and profitable growth in the sheep as that produced on drier ground. If the farm be hilly or composed largely of gravel of a dry nature, I would advise this inquirer by all means to keep sheep. If it be low, flat and of a damp nature I would greatly prefer cows. If the land is part dry and part wet, I would say let him try mixed farming, if it is possible to do so; then he would have a chance to experiment and find out for himself, a far safer way of doing than to rely entirely on some one else's judgment. Mixed farming I believe will pay as well and be a great deal safer.

There are a great many points to be brought into consideration in answering this question, far more than can be discussed here. In fact, it would be an impossibility for a man living in another State and unacquainted with the correspondent's farm and surroundings to answer the question as it should be.

Chautauqua County, N. Y.

FROM IRVING D. COOK.

My answer to the above important problem can hardly fully relieve the anxiety or expectations of the inquirer. In the first place, were it possible to designate certain reasons why either one of the two industries referred to would meet with better financial success in a certain locality, at the same time giving "facts and figures" to substantiate it, the conditions and circumstances existing in another might be such as to cause an entire reversal of what would have seemed a wise course to pursue. While therefore it seems impossible to establish any definite rules, to be followed year by year in relation to this matter, would it not be well for "Young Farmer" by his own experiment to settle the question for himself. As he has about 150 acres of cleared land, good barns, etc., also several head of high-grade Jersey cows, it is to be assumed that he also has the conveniences at hand to manipulate the milk and cream either at home or at a near-by creamery or cheese factory. He can thus faithfully devote the care and attention required for a maximum production in this direction, carefully calculating the expense as nearly as may be. He can also invest in sheep to the extent his accommodations will allow, selecting those best adapted for success. The most desirable at present perhaps are those belonging to the coarser-wooled breeds, as they are better suited for supplying the increasing demand for the choicest quality of mutton, and also for the production of the early or "hot-house lambs" now so popular in our Eastern markets. A favorite and common method practiced by our Western New York farmers is to feed lambs during the winter, when at the age of eleven or twelve months they are in condition for market, usually selling on the farm at about six cents per pound and this is considered the most profitable feature connected with sheep-raising at the present time. Of course our friend will not allow himself to be confined solely to these two branches of husbandry, thus risking all his eggs in two baskets as it were; but he should adopt a system of mixed farming, growing the different fruits, especially the apple and pear, for market purposes, together with the grain crops indigenous to his latitude and locality, reserving each year a liberal area to be planted to the most popular variety of market potatoes: all of which with proper care and cultivation, will, as a rule, bring satisfaction and profit, and it will undoubtedly be made manifest in the meantime, which if either of the above industries will be the more desirable.

Genesee County, N. Y.

SKIN DISEASE AND COLDS IN A HORSE.

J. R., Marshville, N. Y.—1. A skin disease like mange breaks out in blotches on one of my horses the year round, doing so worse in warm weather than at other times. What should be the treatment? 2. What should I do for another horse that is troubled with a bad cold?

ANSWERED BY DR. F. L. KILBORNE.

1. Give six drams of Barbadoes aloes with one ounce of ginger in a ball or drench, to open the bowels. Repeat the dose in 36 hours if no effect is produced by the first. Then twice daily in the feed give two tablespoonfuls of the following powders: Carbonate of potash and sulphate of soda each one pound, powdered gentian root one half pound, and powdered nux vomica one-fourth of a pound, mix. Feed moderately on a laxative diet. Give no corn or other heating agents. 2. Rest in a dry, well ventilated stable, and a restrictive, laxative diet usually constitute all the treatment necessary for a common cold. If the bowels are inclined to be costive five or six drams of aloes may be given to advantage. If the animal be feverish, give 25-drop doses of tincture of aconite two or three times daily, and one ounce of nitrate of potash night and morning; or if the animal shows signs of weakness give one to two-ounce doses of sweet spirits of niter instead of the nitrate of potash. If the cold be accompanied by a cough, mix 25 drops of tincture of belladonna and one tablespoonful of powdered nitrate of potash, with sufficient honey or sirup to form a thick paste. Give this dose two or three times daily by placing it well back on the tongue and teeth, to be slowly swallowed. If there is hard breathing or a discharge from the nose, steam the head by feeding a hot bran mash, made by pouring boiling water on four quarts of coarse bran, and feeding it immediately in a bucket. If hungry, the horse will work at the mash while hot, but if he does not do so, hold his head over the bucket until well steamed.

RUPTURE OF STOMACH IN A MARE.

J. D. L., Moore's Salt Works, Ohio.—What caused the death of my mare? Her time for a colt was up. She had been worked moderately hard during the spring, and when not worked was pastured. On April 25, she was at work in the forenoon, and was turned to grass in the afternoon, when she seemed in good health. At four o'clock she was found sick and sweating. She would lie down, but would not struggle; then she would get up, walk about a little and lie down again. It was supposed she was trying to foal; but in half an hour she was dead. In 2½ hours she was opened; she was then swollen so much that some of her bowels had burst out through the vagina. The colt was found all right in the womb; but the stomach was bursted for about 27 inches. The contents of the stomach and bowels were rather loose. In each ventricle of the heart there was a good handful of matter resembling gelatine formed in cooking beef. Near the top it was colored and had the appearance of clotted blood.

ANS.—If there was no error in your finding the stomach ruptured, the rupture was undoubtedly the immediate cause of death, it probably being due to gaseous distension of the stomach, from indigestion or colic. The condition of the contents of the bowels or heart was probably normal, or such as you would expect to find in an animal dying in that way. The mass in the heart was simply clotted blood.

DEATH OF A CALF FROM INDIGESTION.

J. H. A., Randolph, Vt.—I had a very fine, large, Short-horn bull calf which was bright and fat when dropped. Though to all appearances healthy, he soon began to bloat, and when he sucked the cow he bloated worse, yet he seemed strong and active. I took him from the cow and fed him twice, and each time he bloated. When I went to feed him the third time he refused to eat and appeared in great distress. I gave him two injections and some physic, but he died soon. On opening I found nothing in his stomach but a few lumps of curds and some fluid of a light greenish color and somewhat acid.

ANS.—The symptoms indicate indigestion, which may have been due to the calf being kept from the cow, with too long intervals between feedings; or to the milk being affected through the diet or condition of the cow, so that it did not agree with the calf. If the cause could have been discovered and removed, probably no treatment would have been necessary.

A PARASITE OF THE POTATO BEETLE.

S. L. A., Roslyn, N. Y.—I send the RURAL specimens of the Colorado potato beetle covered so thickly with parasites that in some cases the pest is entirely concealed. Is the parasite known to entomologists?

ANSWERED BY PROF. J. H. COMSTOCK.

Yes; this parasite of the Colorado potato beetle is a well known one. It is a species of mite not infrequently found infesting the potato beetle in New York State. Its scientific name is Uropoda Americana. There is a figure of it in Riley's ninth Missouri report, page 41. When this mite infests a potato beetle it is apt to occur in such great numbers as to completely cover the infested beetle. But I have not observed instances in which any considerable number of beetles were infested by it. I hardly think we can hope this mite will play a very important part in keeping any check on this scourge of the potato.

TO REMOVE WARTS FROM A COW'S TEATS.

W. H. J., Joliet, Ill.—1. How can warts be removed from a young cow's teats? 2. What kind of onions are the best to sow in the fall to produce early green onions in the spring?

ANS.—1. There are several remedies for warts; the following was published in the RURAL last year: Apply nitro-muriatic acid to the warts every other day. Hold the teats so that you can apply the acid drop by drop, and rub it in, using the bruised end of a soft stick the size of a pencil. Be careful not to get the acid on the other portions of the teats or udder, or to apply so much to the warts that it will run off. The calf must be kept from the cow while applying this treatment, and the acid should always be applied after milking. 2. Any good kind, red, yellow or white, as preferred.

INCUBATORS AND POULTRY BREEDS.

M. B. T., Ashville, N. C.—1. Where can I get a cheap, but good, incubator? 2. What are the best three breeds of chickens for laying, sitting and the table?

ANS.—1. Cheap in the sense of low-priced and good are not always synonymous terms. S. W. Guthrie, Homer City, Pa., makes a good incubator. There are cheaper ones, but they are not always reliable. 2. Wyandottes, Plymouth Rocks and Leghorns or Light Brahmas are as good as any, although the choice of a breed must be determined largely by personal preferences, conditions under which they are to be kept, and the object in view. The Leghorns are useless as sitters, and are inferior to the other breeds mentioned as table fowls.

SOUTH CAROLINA PHOSPHATES.

E. O. H., Windham, N. Y.—Who sells South Carolina phosphates in the form of floats?

ANS.—J. Campbell & Co., 59 Wall St., New York, who deal in South Carolina rock write as follows: The present price of South Carolina phosphate rock in the ground form is $15 per ton of 2,000 pounds f. o. b. in New York in car-load lots in bags. The crude rock having recently advanced, ground has gone up proportionately. There is no difference in price between floats or ordinary ground rock. Mona Island W. I. guano is in even a finer state of division than South Carolina floats and contains seven to 10 per cent. of available phosphoric acid, besides 15 to 20 per cent. insoluble. This we sell at $21.

ABOUT TEOSINTE.

J. M., Sarnia, Canada.—What has been the RURAL'S experience with Teosinte?

ANS.—Teosinte was raised at the Rural Grounds 10 or 12 years ago. The plants make little growth until settled warm weather and then grow luxuriantly. The stem is short-jointed as compared with corn and will continue growth if cut back. Our season is all too short either for the plant or for seed to mature. A single seed will produce a great number of stems or suckers. The plants were with us about four feet high when killed by early frost. This is botanically Euchlœna, by some called Reana luxurians.

Miscellaneous.

S. M. K., Williamsport, Pa.—What is the proper time to start a strawberry bed?

ANS.—We should select August, late or early, as the weather may be dry or wet.

G. R. W., Lyndon, Ky.—What is the parentage of the following grapes: August Giant, Amber Queen, Rochester and Woodruff Red?

ANS.—August Giant is said to be a cross between Black Hamburg and Marion. The parentage of Amber Queen is not known to us. Rochester and Woodruff Red are pure Labruscas.

B. R., Broad Ford, Pa.—What is the cause of the appearance of lice on currant bushes and various trees, and what is the best way to destroy them?

ANS.—These plant lice attack many different kinds of plants. If the plants are very vigorous they do little mischief: if the plants are weakly they injure them accordingly. The cause of lice is simply that they exist in great numbers and naturally seek their food. The best remedy is the kerosene emulsion.

H. K. G., Columbus, N. J.—I have a cow that has a swollen tongue, with a swelling under the jaw, and her cud often gets fast in her mouth so that she cannot swallow until relieved. She has been in this condition for over two months. Within this time she has had a calf which will weigh over 150 pounds. She has become very thin, but is otherwise apparently well. What is the trouble?

ANS.—A personal examination would be necessary to ascertain the cause of the trouble, which may be the result of disease or an injury.

E. W. H., Bowling Green, Ky.—I dried off a cow about four months ago when she was giving about a quart of milk a day. In about two months I noticed that one of her teats was larger than the others, and an examination showed that there was blood in it. I have milked it out two or three times. She is due to calve in about 30 days. What should be done to preserve the teat in good condition?

ANS.—The teat or quarter was probably injured in some way. If hard or swollen, bathe frequently with hot water, and if tender, apply belladonna ointment after each bathing. Keep well milked out.

G. S. C., Ashaway, R. I.—Six years ago I set out 50 Orange quince trees, as I supposed. They have borne a few fruits for the past two or three years. Last fall I noticed a difference in the fruits. Those from some trees were small and stunted; those from others large and yellow. The latter were one-third longer than the fruit from the other trees. They were round, with short necks, clean skins and no bloom. The other quinces had larger necks, were of a greenish-yellow color and had a fair bloom. I noticed to-day that the trees that bore large yellow quinces have pink buds, while the buds on the others are yellow. Are there two varieties?

ANS.—Probably the quinces with short necks are the Orange or Rea's; the others the Pear.

A. P., Hoboken, N. J.—1. What will kill blight on plants? Tobacco smoke has no effect. 2. Is there a plant called Brugmansia arborea? 3. How long would a Washington fillifera palm have to grow to show the true character of the species.

ANS.—1. By "blight" you probably mean some sort of insect vermin; while tobacco smoke destroys green flies and thrips, it does

not kill mealy bugs or red spider. Brush off these insects, then with a soft sponge and plenty of soapy water wash the plants thoroughly clean, and repeat this washing in a few days to make sure that young and old, eggs and insects have been destroyed. 2. Yes. Its proper name is Datura arborea. It is a native of Peru, and a large-growing but showy shrub, with white blossoms seven or eight inches long. 3. Much depends upon the health and vigor of the plant and the conditions under which it is grown. Not under three years from seed.

DISCUSSION.

SUGGESTED BY THE HARROW SPECIAL.

E. D., INGHAM COUNTY, MICHIGAN.—It seems to me that the full importance of the harrow as a farm implement is not generally appreciated. No other tool does so great a variety of work under such widely different circumstances, The work required of harrows is of the first order of excellence, and that any one kind can be the best for all the varying conditions of soil, season, and effect, promises to be a physical impossibility. Most farmers own but one, or, if they have a second, it is of the same kind as the first. Is this wise?

WHAT HARROWS HAVE TO DO.

1. To firm the seed-bed, to which end the implement must work deeply and thoroughly. I have recently seen many fields plowed and fitted for sowing, in which the surface looked well, but the foot, every now and then, dropping through into some hole only covered over, betrayed the fact that the beautiful surface rested on an unstable foundation. First of all, fit the bottom of the seed-bed, and then give attention to the top if both cannot be accomplished simultaneously.

2. The soil must be pulverized, and to this end all the ground must be handled to a reasonable depth, and the friction distributed evenly over the surface. Tools with large teeth and only a few fail utterly in both these requisites; they run shallow, and cut only portions of the surface.

3. The surface must be leveled and smoothed, and to this end the tool must run close to the ground and be able to move some earth.

4. Harrows are sometimes required to compact the surface; at other times to loosen and leave it as light as possible, requiring, in the first instance, pressure, and, in the second, none. For the first the implement should hug the ground; for the second it should run free and deliver the earth behind with an upward turn as does the Acme or Cutaway. From the nature of the case these varying and often antagonistic qualities cannot be found in any one style of implement. A man cannot afford to own but one. There are two well defined sorts, the deep worker and the smoothing harrow. One should have both.

WHAT HARROWS SHOULD NOT BE REQUIRED TO DO.

It should not be expected that harrows will do well after a poor job of plowing; or work well on sticky land, or when dull; or draw easily; or find their own shelter or go without; neither should they be expected to work well for any but their rightful owner.

Harrows must not tear up sods or litter; the teeth must be arranged in such mathematical order as not to trail; that is, those that cut next to those of the first row must not be in the second row, but back of the center. They should move the soil to one side rather than straight ahead: and, above all things, they should not be mounted upon wheels. I should like to see this tool more freely discussed.

FIGHTING THE FLEA-BEETLE.

W. B. ALWOOD, BLACKSBURG, VA.—I notice that the RURAL is again in tribulation about the Flea-beetle. Remembering its serious trouble last year and failure in the potato contest owing to this little pest, I venture to give a bit of my experience:

Last March, shortly after having planted early cabbages out in the field, we had some very hot, dry weather for that season of the year, and the Flea-beetles appeared in myriads. I never saw so many. Many of the plants were literally blackened with them, and it seemed as if they would entirely ruin the plants in a few hours. At once I made some kerosene emulsion after the usual formula originally given by Dr. Riley, and sprayed the plants thoroughly with it diluted ten times. The beetles took to flight very readily, but the preparation was driven among the plants with such force and in such a fine spray that many of them were caught and killed. I applied it with such force as literally to fill the air with the finely divided particles, and as a result I had next day the pleasure of finding the dead beetles scattered over the earth and plants in large numbers. This one application by no means ended the fight. I found it necessary to repeat it every few days for nearly two weeks, but as a final result I saved the entire crop, not half a dozen plants were killed. The same application was successfully used on small plants in the cold-frames.

For making this application I recommend the Japy double cylinder knapsack pump, with the Alwood lance and Vermorel nozzle. This pump was imported from France for my work while an assistant in the Division of Entomology at Washington, and since leaving there I have had several pumps made, after this pattern, by Robert Leitch & Sons of Washington. The lance is my own design and works admirably in throwing a direct spray upon plants. For underspraying I use the Raveneau nozzle on a Japy lance. This latter is unquestionably the best implement for the purpose yet made. This pump and the two lances make an outfit suitable for all kinds of work, and one far superior to anything else to be had in this country.

I do not know what strength of kerosene emulsion young potato plants will stand, but I am satisfied that an emulsion containing one part of kerosene to 20 of water can be used, and the plants should be thoroughly sprayed with an emulsion of this strength, or even with a stronger one, if it can be safely done. The application should be made in the heat of the day, when the beetles are most numerous.

A WORD FOR TRUSTS.

A CITY FARMER, PITTSBURG, PA.—I note that the RURAL has considerable to say about "trusts," always speaking against them, never "giving the devil his due." I am not interested in any way in any trust, but as a jobber I saw a great deal of benefit in the rubber trust, for this reason: previous to the combination the chief object of all was to make the lowest-priced garment, not the best. After the establishment of the trust the ambition of all was to make the best for the money, and thus secure the trade of jobbers and retailers, for there was a list price and certain discounts, and the rule no longer was, every fellow for himself. Don't you know some persons who have bought cheap (so-called), but in the end very dear, gossamers or water-proofs, because the price tempted them or they were not willing to buy a good article at a reasonable margin to manufacturer and retailer? And the first time it was wet, did they not condemn it and all through whose hands it came? Here is an instance: A large Broadway house offered an order for 5,000 gossamers to a firm if it could get them at a price which would enable it to make $1 the retail figure. Well! the manufacturer needed something to keep his factory open, and finding a margin of one cent per garment accepted the offer. The articles were made, delivered, examined, found satisfactory, paid for and sold to the retailers faster than hot cakes, because the price was less than those at which goods of that kind could be bought from combination firms. What were they made of and how? Muslin, lampblack naphtha and flour; short, scant and small in every way. The consequence was that if the retailer kept them until the naphtha had evaporated, he could take them out of the bags and shake the water-proofing (?) off. If the wearer were unfortunate enough to go out in the rain without an umbrella, she got wet and had nothing left but a black rag. Now, tell me, reader, was this trust a good thing for the consumer or was it an illegal affair to drain hard-earned money out of her pocket? Is it best to pay an honest price for a good article or to buy such as the above at slop-shop prices? Is it not best to give the retailer a living margin? He can pay the manufacturer a living profit, the manufacturer pays his hands better, the employés can pay more for their victuals and are better citizens, and the farmers can get better prices for their products.

CHEMICAL FERTILIZERS AT THE WEST.

PROFESSOR GEORGE E. MORROW, CHAMPAIGN, ILL.—I have no doubt the use of commercial or chemical fertilizers will become more and more common in the Central Western States. There has been a marked increase in the quantity used in Ohio in recent years. In Illinois and in States farther west their use is, as yet, the exception rather than the rule. There are good reasons for this. On most of our fertile prairie soils even liberal applications of these fertilizers usually give little increase of crop. On those which have had the available supply of plant food considerably lessened by long-continued cropping without fertilization of any kind, like applications often give a large increase of crop But when the farm products sell at low prices, only a large increase in yield will repay the cost of chemical fertilizers. As yet the time has not come for the general use of these fertilizers by the farmers of Illinois. Rotation of crops, with clover holding an important place; the encouragement of increased attention to live stock, with better care of and judicious application of barn-yard manure are the present practical points in this direction for us. Alongside these, however, something can be done to remove the lack of information concerning the nature of chemical fertilizers, and their use in experimental ways is to be encouraged. When live stock can be secured at even a slight profit it is not probably wise to make chemical fertilizers the chief reliance in maintaining the fertility of the soil. Rotation, clover and other green manures plowed under, good tillage and, last but far from least, stable manures will, probably, long be the chief reliance of Western farmers.

NEPAUL BARLEY AGAIN.

W. P. W., MONROE, WIS.—In the RURAL of May 18, a description of Nepaul barley is given, but the estimate of its value may be incorrect. Because it has been seized on by swindlers for the purpose of fleecing farmers is no proof that it is worthless. I received from a seedsman of Chicago, six bushels of a hull-less barley called Nepaul, which (with other varieties) I have sown for him for seed, and I am very sure that this seedsman will make only an honest and proper use of it. I have no interest in it except to grow it for him. It is nearly of the color of rye. The grains are very large and plump, and entirely free of hulls, and so far as I observed, remarkably uniform in size. A gentleman recently from the new State of Washington, where he has lived for some years, tells me that a kind, called the "bald barley," and which he thinks is the same, was several years since introduced there, he thinks from France, and he says it is much more productive than other kinds, and is extensively raised.

That which I sowed is making a fine growth; but, of course, I do not know what it will amount to.

EXPERIENCE WITH MELONS.

D. D. C., DAYTON, OHIO.—Last spring I planted the selected strain of Hackensack Nutmeg seed sent out by the RURAL NEW-YORKER in the previous year's Free Seed Distribution. The melons were very fine and large and none of them were rotten in the blossom end; while in half an acre of Hackensack melons, the seed of which was bought of seedsmen, more than half the largest melons were unsalable on account of being rotten in the blossom ends. I also planted one ounce of selected Osage melon (Vaughan's novelty of last year) costing $1. There were 185 hills and there were five seeds to each hill. From these I did not get one sound, ripe melon They all rotted at the end before they ripened. The dealer gave me a packet of the Osage seed free (with a later order). These were planted on pieces of sod in a hot-bed and some of them under glass bore melons which were very fine in quality; but some of them also rotted in the ends. From my experience of last season, I am led to the conclusion that seed saved from melons having rotten ends, will produce melons with the same fault.

The RURAL'S Hackensack seed was saved with care.

WHY I STEP ON POTATOES WHEN PLANTING.

E. S., YORKVILLE, ILL.—In the West we use either the stirring plow or cultivator for furrowing out potato rows. I object to the stirring plow because it is hard to regulate the depth of the furrow without making it so deep and wide that it is hard to drop the seed potatoes in a straight line, a failure to do which makes bad work when cultivating.

I use the cultivator, going twice in a row, the second time stirring the ground at least six inches deep, but the shovels are not large enough to leave the furrow open more than three inches deep, and by stepping on the pieces of potato I press them, without injury, about an inch into the mellow soil, leaving them about four inches below the level surface. Some may object to this because of the injury done to the sprout. I find it difficult to plant potatoes that are sprouted much without either breaking off or bruising the sprouts—which I consider as bad as breaking. I planted potatoes in the last days of April that were badly sprouted and they are up now (May 24) large enough for the plow.

CHICKENS AGAINST THE FLEA-BEETLE.

B. R., FAYETTE COUNTY., PA.—The Flea-beetles are the worst nuisances I know of, and they are worse here this spring than ever before. Dusting with soot, lime or plaster generally drives them away if this is carefully done every few days, but the only effectual guard against them is that employed by gardeners here to keep them off cabbage plants, etc, A lot of chicken coops are placed where the fleas are, with lots of chickens just hatched; the more the better. If there are a comparatively large number in proportion to the size of the place, they will effectually rid it of the pests in short order. That is the only way in which a neighbor of mine and myself managed to save our cabbage plants last year; but I am afraid it would not answer for potatoes, as the little chicks could not pick the insects from the potato stalks,

SOOT FOR THE FLEA-BEETLE.

F. M., STAMFORD, CONN.—For the flea-beetle try soot well sprinkled on the plants. The pests commenced upon my tomato plants, but soot has so far disgusted them. One of my neighbors tried it last year and had no trouble either with beetles or bugs, and so far this year he has had no trouble.

G. S. P., WINSLOW, ME.—To us in this grass-growing region, along the Kennebec, the RURAL Hay Number is very interesting. Three years ago I ascertained the cause of the "perfumed hay" Mr. Goffart speaks of. My hay is cut early, as a rule, but at that time a strip of poor, ripe, fine grass was cut late, cured and got in the same day. When raking it I noticed it had the powerful perfume which I had always supposed to belong to early cut hay alone. This odor I am sure came out the first afternoon, and by opening and sunning it the next day it would have been dissipated, as is usually the case. As it was, the hay retained the pleasant odor until it was fed, late the next spring, and no hay could have been eaten by the cows with a better appetite. I have noticed the same thing since, and am confident that too much curing spoils the hay. In this region we sell our best hay and feed our best hay; we have the cake and eat it, too. The prime, coarse Timothy goes to the Boston market, where it brings a high price. Few would feed it if they could. We prefer the finer hay—the Red-top, and clover—which makes more and better milk and keeps more of the elements of fertility on the farm.

The Champion mower is the favorite here. I have used it. I have also a Warrior. It is extremely light and strong, very easy for the team, and it has a seat so near the ground, and requires so little oil to keep it running, that it is a luxury to use it. My team are slow walkers, but as long as they move at all it does perfect work.

H. F., WAYNE COUNTY, N. Y.—In the RURAL'S report of the churn test at the New Hampshire Experiment Station, I think the fact is demonstrated that a single trial proves but little. In regard to the "perfect granulation of butter" at that trial, I have nothing to say; but if the report of that part of the trial is on a par with the other two points of superiority mentioned, I have my doubts as to its reliability. I have operated both the Blanchard and the Davis, and I venture the assertion that I can churn a given quantity of cream in a Davis churn with the same expenditure of force that would be required with a Blanchard containing half the quantity. But "the most unkindest cut of all" for the Davis is that it is more difficult to clean. Hundreds of Davis churns are in use in this county, and one of the strong points in their favor among the farmers' wives who use them, is that "they are so easy to clean." They are perfectly smooth inside and need not be lifted, and I do not see how it is possible to construct a churn that would be an improvement in this direction. A few such reports as this will do more to shake the faith of thinking, practical farmers in the reliability of such reports than can be counteracted in a long time.

I. J. B., TITUSVILLE, N. J.—Apple blossoms have been very abundant and probably most of them are fertilized. I find a great variety of blossoms. There is among them considerable difference in size and an endless variety of color. Who can tell whether color has anything to do with productiveness? The time of opening has an influence. The different stages of bloom on the same tree constitute a great insurance of a crop, and a provision against overbearing. The indications here are that apples will set too much fruit this year. I think the reason why some apple trees are not productive is because the blossoms are imperfect. I find the Primate with a short style, the stigma not united, yet almost so, the anthers out beyond the stigma—a poor position for fertilization. I find Smith's Cider with three to five stigmas on long styles so that the stigma is beyond the anthers, in the best possible position for fertilization. Is it possible that the fertilization of one or two of the stigmas, instead of all, is the cause of imperfect or one-sided fruit. If the corn grain fails because each separate grain is not fertilized, why should not the apple.

L. A. W., FARWELL, MICH.—This morning I was reading aloud the RURAL'S appeal for help in fighting the Flea-beetle, when "our girl" inquired if we had ever tried ammonia. Her uncle, she said, used ammonia in water, to keep the little flies and other insects from his cucumber vines and other plants, and

with complete success. She was not quite sure as to the strength of the solution—one or two table-spoonfuls to a quart of water she thought. My first impulse was to wait and test this remedy before writing to the RURAL, but my second and best thought was to submit the matter at once. My potatoes are not yet above ground, b't a neighbor reports that his vines are being destroyed.

A. A. C., AMES, IOWA.—As to the comparative hardiness of Red clover and Alfalfa, discussed on page 336, I think there can be no question. A six-acre field of Alfalfa sown here last spring was so badly killed during the past winter that only scattering plants remained and the field was plowed up. Fifteen acres of clover sown at the same time were uninjured except a little on an exposed gravelly ridge.

J. L., OCEANIC, N. J.—Has the RURAL tried "Hammond's Slug Shot" for the Flea-beetle and, in fact, all kinds of pests? If not, it should try it. I am only an amateur. I have nothing to do but to experiment for the best success with flowers, vegetables and poultry and I find nothing equals "Slug Shot."

R. N.-Y.—Slug Shot is virtually plaster and some form of arsenic intimately mixed.

What Others Say.

HORTICULTURE FOR WOMEN. MRS. B. Parsons, in Harper's Bazar, says that looking over the whole ground with the experience of nearly half a century, he sees no reason why horticulture for profit should not be largely in the hands of women. Each woman esteems herself competent to manage a house, although she may employ a man to care for the furnace, to cut the wood, or to cart the coal. So she could manage any horticultural business, men being employed to do the work requiring muscle. It is eminently proper that women should adopt the business of florists, whether as employers or employed. In the problem of happiness which all humanity is endeavoring to solve, labor is an important factor. Therefore the woman who adopts horticulture for its money-producing capabilities may obtain more lasting enjoyment than the pet of the drawing-room, who looks upon a flower as she would upon a brilliant gem or a beautiful picture.

There is more than a money appreciation in the woman who works herself among her trees and flowers, watching their growth and bloom as a mother watches those of her child. When she plants, her labor and her love can illustrate the lines:

"Wide let its hollow bed be made,
There gently lay the roots, and there
Sift the dark mold with kindly care,
And press it tenderly.
As 'round the sleeping infant's feet
We softly fold the cradle sheet,
So plant each shrub and tree."

It is this sort of mother-love which makes some women succeed with every plant they touch.

Looking upon horticulture as an avenue for many women to a living, there can be seen an opportunity for benevolent men who wish to make the wisest use of their money. A gift or bequest to a college or a library has become a very ordinary thing. Many wealthy men indulge in it. A gift or bequest to found a horticultural school for women would be unique, would be the means of relieving a large class, and would endear the giver to posterity.

PROF. COOK, of the Michigan Agricultural College, in his treatise on silos and silage, to which we have already several times alluded, says that he can grow the most corn with the least labor by planting it in drills. He advises that we plant, cultivate and care for ensilage corn just as we would to secure the best field corn. His silo is 20 feet high, and he would now add five feet more, if building another. With a good silo, he says, farmers can sell most of their hay at a large profit, and yet keep their farms in fine condition.

Silage is succulent food, and so, like green pasture, is appetizing, digestible, assimilable: just the food that suits the needs of the animal. It costs Prof. Cook less than 50 cents per ton for putting corn into his silo. Good silage increases the milk of cows and increases the butter yield. There is no injury to milk, cream or butter. Farmers must keep stock, cattle, sheep, hogs and horses on the land—the more the better. With silage properly secured we can increase our stock one-half. Many say that the stock can be doubled. Double the stock, double the manure, double the fertility, double the production.

The ears of the corn, as well as the stalks, are cut and run into the silos. There is no other way in which the corn can be harvested so easily and cheaply. In the silo the corn is softened so that no grinding is required; for even cattle will digest thoroughly this softened corn in the silage.

Beyond question, corn is the most profitable crop for silage. It is a very sure crop, and with a good yield of from 12 to 20 tons per acre As three tons of silage are worth one ton of the best hay, this is equal to from four to ten tons per acre. Again, this is the cheapest way of harvesting corn, and it can be put in a small barn space.

The silo can be opened and its contents fed out at once if desired; or it may remain closed, as will usually be the case, until cold weather sets in. It answers well as the main food ration for all kinds of stock at any season of the year. It is doubtless improved by adding bran, oat, linseed or cotton seed meal, when feeding the silage.

Silage is a pretty good food ration alone. If desired to add more albuminoids, bran and oil-meal are easily obtainable. It is quite likely that it may pay to make silage of clover and mix this with corn silage when feeding. Prof. Cook's success with corn silage has been so marked and satisfactory that he believes it to be of the first importance and highest value.

If the silo is full to the top, it should be allowed to settle a day or two and then fill to the top again, which should be twice repeated. At the last a foot or two of cut straw should be put on top, and this weighted by a few boards to hold it down. The old way of weighting with tons of stone, earth, etc., is shown, by ample experience other than his, to be utterly useless. It is labor thrown away. Prof. Cook has proved now for two years that the old rule to cut and fill one day and rest the next, that the silage may heat and destroy the germs of fermentation and thus fill on alternate days, is not necessary. He advises filling rapidly, as he knows it is safe and excellent in its results. There is no doubt that filling leisurely, as suggested will give just as good results, as many have proven this to be true; hence, if more convenient, the filling may go forward on alternate days only.

THE RURAL'S LUNCH.

THE SECRETARY OF AGRICULTURE, in reply to an inquiry made by the Farmers' Review, states, what all farmers ought to have known, that all information furnished by the several divisions of the Department is furnished gratuitously.....

T. D. Curtis says in the Dairy World that it may be set down as a rule that the very best butter-makers leave the poorer cream in the milk. There may be some exceptions, where other conditions come in to modify results; but these exceptions will probably be found no more than are necessary to prove the rule. Thorough experimentation will ultimately demonstrate that the butter-maker has the choice between better quality at a small loss of quantity and a small increase of quantity at the cost of a somewhat reduced quality. Extreme quantity and superior quality are not compatible by any known process. .....

Dr. Babcock holds that the sooner milk is set after it is drawn from the cow, the more complete the separation of the cream. The delay of a few minutes in his trials, had a marked effect on the per cent. of cream left in the milk, the amount steadily increasing with the increase of time. He thinks that the fall of temperature has little to do with the matter, as milk which had been delayed in setting, when afterward warmed up, did not part with its cream any better than milk delayed in the same way which was not warmed. This is contrary to what has been taught by good authority, and needs confirmation by additional experiments.....

Dr. BABCOCK recommends not only immediate but cold setting, as sudden cooling prevents the fibrin from coagulating. If he is correct, a vast amount of cream has been lost in the past by shallow setting in the air. But as salt prevents the coagulation of fibrin, why may not the addition of a very small amount of salt immediately after milking have the desired effect of keeping the fibrin in a liquid form?.....

THE new Bush Lima furnishes a starting point for a dwarf variety to take the place of the old Lima. The Bush Lima, though a good thing, is, nevertheless, the smallest of all Limas, and cannot yet entirely supersede the old large Lima. But having secured the habit it will not be long before we have the big bean on the small bush. As grown with Mr. Massey of Crozet, Va., as he states in Garden and Forest, last summer the Bush Lima, or Bush Sieva, was fully two weeks or more earlier than the pole Sieva, and more than that in advance of the large Lima. It will thus be of great advantage in localities too far north for the large Lima..... .....

EXPERIMENTS in heating greenhouses, made by the Massachusetts Experiment Station, designed to show whether steam or hot-water heating is more economical, gave the results that the hot water boiler consumed 720 pounds less coal than the steam boiler in February, and 688 pounds less in January, a saving of nearly 20 per cent.

At the same time the temperature of the room heated by hot water averaged 1.7 degree higher than that heated by steam.

The temperature was more even where heated by hot water, and consequently there was less danger from sudden cold weather. This was strikingly shown on the night of February 22nd.....

EVAPORATED SULPHUR is given as a remedy for rose-mildew, lettuce mildew and red spider..... ....

ARSENICAL POISONS at the Vermont Station had no effect upon the coddling moth

THE VERMONT REPORT also says that if a person has a small piece of ground on which he desires to get the largest possible amount of fodder for green feeding throughout the whole summer, Prickly Comfrey seems well adapted to his wants. The Report speaks well of Japanese buckwheat. .. ..

THIS STATION sent Alfalfa seed enough to sow one-fifth of an acre to 44 farmers of Vermont. This was two years ago. The first fall reports were received from 30 of these men—mostly favorable. Later reports received during the summer of 1888 showed that not one in the original 44 could be found to speak a good word for it. The spring of 1888 had found it missing. The chief reason assigned was that it had not wintered and was a fail ure..... .....

MR. CLAUS SPRECKELS says that as regards making sugar from beets in this country it is a new undertaking, and if his enthusiasm does not lead him too far, it is bound to be a success. The sugar that is made from the beet is more powerful, that is, it possesses a greater sweetening faculty than that which is made or purported to be made from the sugar cane. Besides as to its purity, it can be best manufactured by being kept from adulteration ...

THE California Pioneer Press says that the cultivation of sugar beets on the Pacific coast is said to be a success. What is wanted now is the cultivation of some scheme to beat sugar trusts and other beats as well.. ....

JOHN GOULD says, in the Western Rural that he sold $114 worth of milk from one acre of ensilage and $22 worth of bran and clover hay. The milk brought $1 40 per cwt.....

OUR READERS are again reminded that the new Japan buckwheat is liked by all who have raised it in so far as the R. N. Y. has heard. It is preferred to any other variety.

THE GRUBS of the asparagus beetle are now doing their destructive work. Dust them with lime ... .

IT would have sounded strange, a few years ago, if a man like Prof. A. J. Cook, of the Michigan Agricultural College, says Hoard's Dairyman had said it was a wasteful practice on the part of a farmer to pasture his cattle on good arable land. But he says it now; and though the stupid million are skeptical still, there are growing thousands who know it is true. These will practice on the knowledge, and get rich ere the balance will "catch on."... .....

ABSTRACTS.

——HEMINGWAY LONDON-PURPLE CO.: "THE RURAL NEW-YORKER was the first of the farm press to use 'London-purple.'"

——A. W. CHEEVER: "I have never been able to see any marked difference in the quantity or quality of milk produced on account of feeding or withholding salt. I think animals may acquire a taste for it that may approach a mere habit."

——PUCK: "Secretary Rusk to President Harrison: 'Another chap wants to know if it improves the common breed of sheep to cross them with the hydraulic ram.'"

——LIFE: "The virgin forest has never been axed."

——MEMBERS OF THE HORNELLSVILLE (N. Y.) FARMERS' CLUB.

——"I DO not believe that any real bad person ever cultivates flowers."

——"WHEREVER I have found flowers in the yard I have found sunshine in the home."

——"AS A general thing, you won't see the rough element of the human family taking to flowers."

——"I THINK those who cultivate flowers are far more apt to clean up the rubbish, cut the briars and straighten the fences."

——"WHEN I go by a house where flowers are well-cultivated, I think there must be cultivation inside. When a man can sit down in his own yard and enjoy flowers, he grows better day by day."

——"I BELIEVE in the male members of the family giving assistance to the ladies. Let us give them more time for thus beautifying our homes by making everything about the house as convenient as possible for them."

——"I HAVE traveled over a considerable portion of this country and have noticed that wherever attention was paid to the culture of flowers, there was a higher moral tone to the people; they were more cultured, more refined."

——"I THINK flowers not only help to beautify our homes, but to make them more valuable. They help to elevate the tastes of those who cultivate flowers. The husbands and sons who help to elevate the flower garden will be refined and elevated by their influence."

——'THE BEST EDUCATION I ever had was what my mother gave me as I worked with her among the flowers. You can't start a real home without something to beautify it. We go to the flower garden to get the decoration for the grave and for the bride. Let one of the family pass through the flower garden; he can hardly resist plucking a flower here, pulling a weed there or helping a struggling climber to a firm hold. Suddenly his eye catches some new beauty; he calls some one else to admire it; then another member of the family is attracted to the spot, and before you know it you have a family gathering about one of the most beautiful altars God ever gave to man."

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has this latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

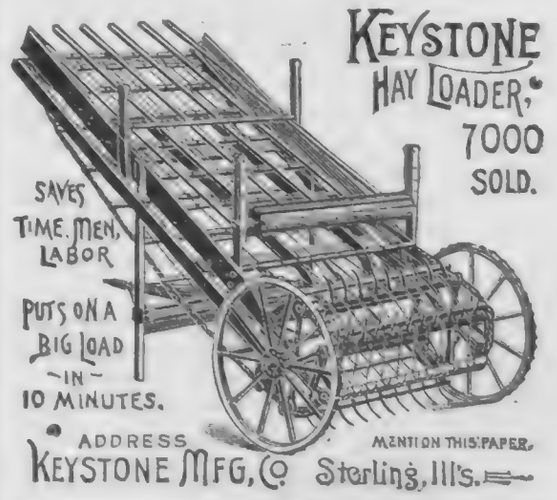
100 Doses One Dollar

JOHNSON'S ANODYNE LINIMENT ESTABLISHED 1810.

For Internal and External Use.

Stops Pain, Cramps, Inflammation in body or limb, like magic. Cures Croup, Asthma, Colds, Catarrh, Cholera Morbus, Diarrhœa, Rheumatism, Neuralgia, Lame-back, Stiff Joints and Strains. Full particulars free. Price 35 cts. post-paid. I. S. JOHNSON & CO., Boston, Mass.

Beecham's Pills act like magic on a weak stomach.



CANADA HARD-WOOD UNLEACHED ASHES

By rail in car-load lots furnished on short notice. Ashes guaranteed to be of best quality and are especially adapted for all grass and fruits. Pamphlets and prices sent on application.

THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JUNE 8, 1889.

SYMPOSIUMS.

WE are ready to discuss on the "symposium" plan any farm or horticultural questions that our readers may need light upon; that is, questions which seem to be of general—not merely individual—interest. Let us hear from you R. N.-Y. readers.

"I was everywhere impressed with the idea that the young native-born women of Massachusetts could do better in every way by cultivating small fruits than by toiling in the factories, as so many of them do."—MRS. FISHER, page 385.

ONE of the recognized dairy rules that is most frequently broken is that of permitting the milk to stand in the milking pail for a time before straining it into the pans. The necessity of getting the milk into the pans as soon as it can be placed there is not generally understood. Many good dairy folks from one cause or another allow the milk to become cold in the pail before straining it. This is entirely wrong and if any of our readers will take the pains to investigate the matter the reason will be readily seen.

Mr. C. S. Rice, who contributed one of the most valuable articles in the R. N.-Y. hay special, writes as follows:—

"My method of curing hay is the same as Mr. Terry's, and after reading Prof. Roberts's article referring to hay loaders and curing hay in the windrow, I was glad to have Mr. Terry for company. Prof. Cook expresses the right view of hay-loaders." He also adds:

"I do not think that you have ever published a more valuable number than the hay special. It alone is worth the year's subscription price."

"I will only say that with a dairy of well-bred and well selected cows, properly fed and cared for, no one has any business to sell cream by the gauge, for he will be cheated every time."—C. R. BEACH, page 380.

THERE is quite a discussion going on as to the value of the hay tedder. Much of this argument is useless because it is not based on conditions that are similar. A good deal of the value of the work done by a tedder will depend upon the way the grass is left by the mower. Some mowers leave the grass in such shape that a tedder will be of little value; in fact, hardly needed. Other mowers spread out the grass so that it needs to be shaken up in order to cure properly. Parties arguing this matter ought to state whether they use a side-cut mower, or a direct draft.

OUR farm contemporaries are now beginning to tell their readers that there is no way to protect their rose bushes, grape-vines, etc., against the dreaded rose beetle but by hand-picking. The R. N.-Y. readers may be assured that one heaping table-spoonful of pyrethrum or Buhach powder in two gallons of water sprayed upon the infested plants will rid them of every rose bug in half-an-hour. The remedy must be repeated every day for several days. The R. N.-Y. made this announcement several years ago, and why our esteemed brothers of the farm press do not tell it to their readers is one of the things we cannot explain.

LAST week the R. N.-Y. referred to the fact that there is a fair demand for apple wood. We are now able to state more about the matter. The wood is largely used for making shuttles. Lithographers use it in making presses, and furniture dealers like it for certain kinds of work. Dealers buy the trees while standing and cut them up, though they are prepared to buy logs or boards also. Trees should be at least 15 inches in diameter. There seems to be little choice as to varieties. The price paid by one New Jersey dealer is four cents per foot in the log. Perhaps there may be a chance to develop this business and make more out of the old orchards.

MANY farmers in this country are growing wheat at what practically amounts to a loss. Other sections can produce wheat and send it to such farmers cheaper than they can raise it, and yet they continue to sow about the usual quantity. Such farmers realize fully that wheat does not pay them. Why then do they sow it? Because they believe that wheat is about the only suitable grain with which to sow grass seed. They cannot bring themselves to sow the grass seed alone. Even if they thought it might grow well alone, they cannot bring themselves to view the loss of the grain crop with philosophy. Many of them would find rye a more profitable crop, while others would find, if they tried it, that they can safely sow all their needed grasses with oats.

ON another page of this issue Mr Hardin speaks of the value of "strippings." Prof. Babcock considers this subject in Bulletin No. 19 of the Wisconsin Experiment Station. The following figures show the average of a number of analyses. The difference is between the first pint of milk drawn from the udder and the last pint.

	Water.	Solids.	Fat.
First pint.	88.45	11.55	1.20
Last pint..	80 58	19.42	9.99

The Connecticut Station has also reported results similar to the above. Prof. Babcock in speaking of the various explanations offered for this phenomenon, says:

"I am of the opinion that much of the milk is elaborated during the milking, and that in its passage through the small vessels of the udder the fat is retarded and consequently more of it is obtained at the end of the milking."

"A man cannot afford to own but one harrow. There are two well-defined sorts, the deep worker and the smoothing harrow. One should have both."—Page 382.

SECRETARY RUSK recommends the reorganization of several divisions of the Department of Agriculture, and among several other additions to it, he urges that the Department should be allowed an Assistant Attorney General, such as all the other Departments have already. The act giving the Department its present executive functions made no provision for such an officer. The old law allowed the Commissioner to employ counsel out of the general fund of the Department, but doing this is prohibited to the executive Departments because they are supposed to rely on the Attorney General and his assistants. A great many legal questions come before the Department, especially in connection with the Bureau of Animal Industry whose duties in restricting and suppressing contagious pleuro-pneumonia often bring it in relation with the laws of the different States. Of course, the new Department should be as well equipped as the old with all the means of thorough efficiency in its work.

IN the article entitled "What Are The Agricultural Colleges Good For," printed two weeks ago, Professor Porter was made to say that these institutions were founded upon a "folly." This was a mistake. Professor Porter wrote "fallacy." This article has been criticised quite severely by graduates and officers of agricultural colleges. We shall begin the publication of some of these criticisms next week. Some of the writers find fault with the R. N.-Y. for ever printing the article. That is nonsense. These colleges ought to be fully able, by this time, to take care of themselves. The R. N.-Y. believes that the main points made by Professor Porter will be answered satisfactorily. President Goodell, of the Massachusetts College, calls attention to Professor Porter's statement that less than one-quarter of the graduates of that institution are connected with agriculture. The figures printed in the college report show that nearly one-half of the graduates are working in some line of agriculture. At the Michigan College the proportion is even greater.

"In general, the farmer who takes pride in having clean and pure varieties of wheat, oats, barley, corn, potatoes, etc., is the best farmer and will be more successful in his business than the one who gets things mixed in his crop or in his head."—F. P. ROOT, page 378.

THE R. N.-Y. does not agree with Mr. Proctor's views—see page 385. The flesh of the strawberry is the receptacle or the end of the peduncle or flower-stalk. The real fruits are the seeds, it is true. The drupelets or fruits of the blackberry and raspberry are joined to a long, fleshy receptacle which might be compared to the flesh of the strawberry. A kernel of corn or wheat is really the fruit, the same as the seeds of the strawberry are the fruits. The kernel of corn is borne in a spike the axis of which is the cob or rhachis. This may and does develop even though not a kernel forms. It develops with the flowers of corn and grows as the plant grows and matures. The "cob and the berry," do not "fulfill exactly the same purpose" by any means, as Mr. Proctor states. Actual tests have been made and it has been found that purely pistillate flowers if protected from pollen, do not form berries. It will be found that many of the so-called pistillates do develop a few small stamens and anthers which probably furnish pollen enough for pollenating the stigmas and fertilizing the ovules.

A GREAT deal of interest has been aroused among farmers in the Northwest by the recent dispatches from the Department of Agriculture relating to flax culture for manufacturing purposes. Hitherto wherever flax has been raised in this country it has been chiefly for the seed which yields linseed oil and cake. There is a strong and growing impression that this country is on the verge of a great revolution in the production and manufacture of flax. Its culture would add another "money" crop to the general agriculture of the country, and keep at home tens of millions of dollars now sent abroad every year in payment for foreign flax seed and fabrics. Why shouldn't this country produce all it needs of flax as well as of other fibrous plants such as ramie, hemp and jute? There are sections of the country well adapted to the culture of all, and American inventive ingenuity should soon devise machinery for handling them easily and economically. Already a machine has been invented for separating the flax fiber from the stalk without wetting, and this alone promises to give an enormous impetus to the flax growing industry.

"To farm in England is better than to farm on the Continent of Europe; but not so good as to farm in America, so far as prospects are concerned."—PROF. SHELDON, page 379.

THE American Meat Company which proposes to rival the "Big Four" in the dressed meat trade, has greatly strengthened its chances of successful competition by the agreement it has just made with the American Cattle Trust. The latter association composed of over 150 of the chief cattle kings and syndicates of the plains and prairies, was organized about a year ago for the purpose of marketing the live stock of the members and of others on the best terms and at the lowest rate of commission, and also to secure better transportation rates on railroads; for it was reasonably believed that a combination of many large shippers would have much more influence than any of its individual members. The arrangement into which the two bodies have entered provides that the company shall slaughter and market all the cattle belonging to the various members of the trust and its patrons for a specified rate of commission. This agreement must be of no small pecuniary interest to both organizations, which together stand an excellent chance of a fair measure of success in their rivalry with Armour and his confederates. The far Western stockmen and the consumers generally are likely to be the gainers by the competition in prices of live stock and of dressed meat; but the cattle owners of the rest of the country are pretty certain to suffer from it.

PHOTOGRAPHS.

THE R. N.-Y.'s plan of printing photographs of farm animals and objects is going to take well. We have already received a number of answers to our request. Most papers show the animals that breeders think farmers ought to buy. The R. N.-Y. will attempt to show exactly what farmers use in doing their work. When we see what we have we can compare notes. Among the interesting pictures to come, we are promised one from Mr. T. B. Terry that will cause not a little excitement. It will show his horses—the ones fed on clover hay exclusively—hitched to his big wagon by means of his convenient three-horse rig, with the various tools used on his farm about the wagon. Many of our readers will open their eyes wide when they see the machines that Mr. T's. 50-acre farm provides work for. This will make a fine picture. We would like one like it from your farm. Some of our readers have provided themselves with portable cameras, with which they propose to show whatever is very bad and whatever is very good in the farm "properties" of their neighbors. On the whole, it looks as though this new plan will add considerably to the R. N.-Y's. interest. We hope so.

A PROMISING NEW HYBRID ROSE.

TWO more of the R. N.-Y. Hybrid Rugosa roses are now in bloom. One of these bears little flowers about two inches in diameter with five petals. The petals are at the base a sulphur yellow, rather paler than the color of the male parent, Harrison's Yellow. This runs into a pink, while the margins of the petals are white. It is worthless from the tradesman's point of view, but it is a mighty queer, interesting little rose all the same. The leaflets are very small and generally 11 to the leaf.

The other, of the same parentage, is also most interesting, and a beauty as well. The bush is four feet high, of great vigor and perfect hardiness. The leaflets are twice the size of those of Rugosa and of much the same texture, though not quite so thick. The flower is the color of Gen. Jacq., though, if possible, more intense. It is of medium size, quite double (having about 30 petals) though not compactly so. At this writing there are 165 buds on this remarkably floriferous hybrid which blooms *constantly* from late May until frost kills the foliage. It fills an unoccupied space, being a double, perfectly *hardy* rose and a *perpetual* bloomer. A photographic picture of this promising hybrid will appear in a few weeks.

"At present, the best service which the people get is the postal. This is run by themselves through their government. They must take possession of all railroads of the country, and build as many new ones as may be needed, as part of the postal system. It must carry passengers and freight, as it does mail matter, at bare cost and the expense of repairs. They must in conjunction with these, take the telegraphs and telephones."—T. D. CURTIS, page 380.

Mr. W. B. Pratt, of Steuben County, New York sends the following discouraging note:

"Destruction here of fruit by the freeze of Friday night seems to be complete. After several examinations the writer fails to find, on his premises, encouragement to hope for a single apple, pear, plum, cherry, peach, quince or grape. The destruction of the latter in the grape regions proper is also extensive but not complete."

BREVITIES.

THE dearest things a farmer can buy are *cheap* fertilizers.

QUITE a number of our readers have asked for a picture of the low truck wagon described by Professor Roberts in the hay number. It is coming. The R. N.-Y. has a photograph of it now under way.

THE "Authorities" seem to agree that the chances are that wool will hold its price and probably gain over last year. These statements are mainly opinions, however, though many of them are founded on excellent reasoning.

AS we go to press the distressing intelligence reaches us of the virtual ruin of Johnstown, Pennsylvania, a place of 10,000 inhabitants and the largest town in Cambria County. At five o'clock last evening the dam of a large reservoir above the town gave way under the pressure of the enormous accumulation of water from the recent heavy rains, and the mad torrent rushed down upon the doomed place and the Conemaugh valley. Houses, shops, factories and every obstacle in its course were swept away and it is reported that 500 people were drowned. For miles below the Conemaugh river was covered with dead bodies and people struggling on all sorts of wreckage. As the telegraph wires for miles around the place are all down, information of details is meager, and it is to be hoped that the early reports are exaggerated, but it is to be feared the disaster may have been even greater than has hitherto been announced.

Horticultural.

DOES INFECUNDITY OF THE STRAWBERRY SEED AFFECT THE BERRY?

I THINK we have been fostering an error in teaching that the imperfect-flowering varieties of strawberries need to be fertilized by the pollen of staminate varieties in order to insure a crop of berries. This position has been held so long and has gained so full a credence in the public mind that it seems to have crystallized into a superstition. The idea must have originated in the mind of some crafty nurseryman as a means of selling extra plants with which to fertilize the pistillate kinds; and it is kept alive year after year through nursery catalogues.

Come, let us reason together: The fruit, so called, of the strawberry is not the fruit at all, but simply the stem altered to develop and contain the true fruit—the seeds. As our plants are reproduced from runners, and only originators of new varieties need fertilized seed, there would seem to be no necessity for fertile seed in ordinary culture. The common belief that Nature avoids futile work and will not build up the berry unless incited by fecundated germs in the seeds, is disproved annually in our strawberry beds, if we could but distinguish; but this would probably not be apparent to the unaided eye. Let us take as a familiar example to the point, the single stalk of maize which we occasionlly see standing by itself in some field where it was accidentally dropped. The pollen, although produced sufficiently, generally fails to reach the ear, and consequently we shall find only an occasional kernel of corn. The cob, however, will not fail to attain its usual size. Now, as the cob and the berry fulfill exactly the same purpose, by analogical reasoning we should conclude that the strawberry, like the corncob, would grow equally well with no help from the pollen. And this conclusion is not based upon mere theory. It has often been reached by observers who know that they had no fertile plants in their beds. Of course, it may be possible that such blossoms are fertilized by insects bearing pollen from a neighbor's, or from wild plants. But it seems more probable that fertilization is quite unnecessary. In my own garden, last year, a bed of Jersey Queens gave an abundance of fine berries although about 600 yards away from staminate varieties.

Non-fecundity of blossoms is the popular scapegoat upon which all the failures of the harvest are loaded. The novice sets a bed, as it may happen, of pistillates. If, for one of several possible causes, he gets no fruit the same season, the wiseacre is approached for a solution of the mystery. He opens his eyes wide, and says: "Why, you hain't got no perfect blossoms to father your berries; no mor'll you get any eggs f'm your hens without a father to your flock." So the bisexuals are procured, and another year brings a full crop, and the full assurance that the only obstacle had been overcome. The grower of fuller experience is familiar with several causes why the berry crop may fail—immaturity in the plants, severe winter weather, late spring frosts, blight from other causes, grubs at the roots, etc.

It is commonly urged as a detriment to a variety that it is a pistillate, and a seedling of this or that well known pistillate is heralded as superior to its parent because it has perfect flowers. A little reasoning here will show this conclusion to be diametrically opposed to the probable; for it is a fact that our most productive varieties are pistillate, as a rule. The Crescent, Windsor, Manchester, Bubach, Jewell, Lida, Warfield, Cloud, Haverland, all pistillates, cannot be matched among the staminates for the amount of berries produced. Now, is it not quite reasonable to assume that the unnecessary production of the male element in the bisexuals is a waste of force, which in the pistillate varieties is not wasted, but turned into the useful channel of berry-production? Division of labor always is economical. The female bee won't tolerate a lot of useless male sentiment around, but promptly gets the surest kind of a divorce, and the hive is soon filled. Our pistillates are the true "workers," and the sooner they are recognized as such, the better for berry-growers.

In considering the fact that surprising crops are often grown with two or more varieties intermingled, I would urge as a probable cause that their different habits of growth may enable them more fully to occupy and utilize the soil than one variety by itself could do. In the same way, if cultivation and proper fertility are kept up, we are told that apples, peaches, currants and strawberries may be set upon the same land, with economy of space and no apparent diminution of yield.

I believe this to be a subject of importance to fruit-growers. Let us have some actual experiments, and if the old doctrine of the importance of fecundated seeds is to hold, let it be through experimental knowledge instead of theory. I propose the coming season to make a conclusive test of this matter, by shielding a small number of pistillate plants from insects by the use of netting, at a sufficient distance from bisexuals that the wind may not carry the pollen to them. I would suggest this test to the readers of the RURAL, so that we may have an abundance of testimony.

FRED. W. PROCTOR.

Worcester County, Mass.

The Swineherd.

THE TAMWORTH BREED OF SWINE.

A. B. ALLEN.

Efforts of English swine-breeders to evolve a better ham and bacon breed modeled on the old Berkshire; things still to be done to secure it; things to be avoided; Berkshires for palatable hams and bacon; what farmers should aim at.

THESE are supposed to be the descendants, in England, of the old unimproved Berkshires, but more or less mixed with other kinds for a long time past. Some American breeders have thought lately of importing a few of them, believing that if they did so, they would possess the pure old stock. But so far as I am informed, they will get no nearer to it than the Jersey Red, or Duroc-Jersey, which is quite abundant already in New Jersey, the Northern part of New York, and three or four Western States. These, also, like the English breed, have been mixed considerably with other swine; but latterly selections have been made from them of animals of a pure red color only, or spotted with more or less black, with shapes and points as nearly like those of the Improved Berkshire of the present time, as they can be found; though the selections are generally of large size and coarser in their make-up. The best specimen of these have been recorded in a Herd Book, and the possessors of the models are breeding as true to them now as they can.

Of the Tamworth, the London Live Stock Journal thus speaks:

"Something still remains to be done to bring this variety of swine to a state of the highest perfection. Breeders are increasing rapidly and the type of animal is being improved. To succeed completely, it must have still quicker growth; it must grow to a greater size within the year, it must be more distinct in type, and more uniform in color and in points generally. Tamworth breeders should refrain from showing spotted pigs, or pigs of lighter color, in fact, than those which are of a rich sandy red. They want greater depth of ham and breadth of loin, retaining the depth of the flank and the length of the body. Directly, however, they commence to breed for short noses and small ears, they will put a check on the propensity of the breed to expand, as well in size as in popularity. The Tamworth breed produces good, salable bacon; the other pure breeds, (except the Improved Berkshire), taking them collectively, produce bacon which is much too fat."

American red swine breeders should heed well what is said by this English journal about breeding short noses on their swine, and I will also add, fat jowls. This has been pursued to some extent lately by a few American breeders of the Improved Berkshire. In consequence of this such stock turn out an increased percentage of fat in the hams and bacon, and make these parts of the swine less desirable to consumers. What the latter desire is tender, juicy, lean meat as free from fat as possible. I have had Berkshire hams weighing 30 pounds or more each, and the rim of fat covering them was not over half an inch thick. The rest of the ham was nicely marbled—that is, very fine streaks of fat, little larger than a hair, ran through the lean in all its parts, rendering it juicy, savory and tender. The bacon was streaked in a similar way, and this is what consumers desire.

Choice lean hams and bacon bring an extra price both at home and abroad, and our farmers ought to take particular pains to produce them. In order to do this their swine should be reared without corn, as this is too fattening. Let them have grass pasture and pumpkins and other vegetables, bran, middlings and barley, oat, rye and wheat meals, and for the last two or three weeks of their fatting, Indian meal.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

STRAIGHT and narrow are the ways of fashion at present, straight skirts guiltless of bustle, held in place by the smallest reeds and tiniest pads are the highest mode. Round bodices or jackets are trimmed with fichus or revers. The fichu, which has been out of date for some years, is now revived, and a very coquettish appendage it is, when rightly worn. Fine embroidered mull in all colors forms some of the prettiest of these trimmings. Pale green, pale yellow, pale blue and faint pink are alike charming. A sprigged or flowered muslin gown, with plain, straight skirt, round waist and full sleeves, is charming with a fichu knotted gracefully in front, and a sash looped on one side.

* * *

THE Directoire sashes are very handsome; they are of silk, wider than ordinary sash ribbon, having a knotted fringe and a band of contrasting stripes across each end. One of old rose had stripes of cream, bronze, Nile and olive green; another in cream had the stripes of deepbrown, terra-cotta, and willow-green. They are worn knotted at one side, and form a beautiful finish for a white frock.

* * *

EVERYTHING now is after either the Directory or the first Empire. Chief among the Directoire garments are the long, straight, redingotes; they are the most useful, most becoming, and most popular of garments. They are becoming to most figures. With them are worn the Directoire poke hats—flat-crowned scoops with the trimming chiefly near the back, falling towards the front. But one may wear nearly everything nowadays, and yet be in the fashion—at least, if the garment is becoming.

TRAINING IN HOUSEWIFERY FOR SCHOOL GIRLS.

OLIVE E. DANA.

IT seems to me that the most efficient and natural training of school-girls in housewifery is that which meets a real need. The assistance, be it ever so small at times, which relieves the mother of work and care, is, if cheerfully, systematically, intelligently rendered, the child's best discipline and ever-strengthening bond of sympathy and intimacy. It should begin very early, ere the little daughter has left the mother's side for her earliest school-days. And the donning of school-girlish ways should not imply the doffing of those habits of helpfulness.

To "do as mother does!" What a large proportion of the child's happiest hours is filled with this endeavor. For this are the tiny broom and wash-board and flat-iron, the thimble and scissors and work-basket bought. For this the bits of dough are given from the maternal bread-board, the little table is made ready for mimic ironing or eating; just as her own are, so dolly's clothes must be cut and made, washed and ironed; though the little hands are blistered in the attempt. And "to help mother" is a yet stronger motive. Dolly's affairs lose their charm, the toys their importance, if the little lassie can smooth "real" towels or stockings, help to set the family table, use the short-handled broom so that mother may not have so frequently to use the longer one.

Thus begun, the little maiden's training goes on by a sort of natural progression, lifting many a task from the mother's shoulders, and satisfying the child's ambition with a sense of increasing skill and usefulness. Even the absorbing interests of later-school days, the academy recitations, compositions, clubs, readings, papers, do not displace these duties, and they hold the girl sometimes to home influences at a time when other claims are most exacting and most keenly felt, keeping a wholesome balance when class-room ambitions and passing friendships, or even worthier interests might weigh too heavily in the girlish estimate.

But we are often reminded that the assistance of the daughters of the household is not always most strictly required of them by the mothers who most need it. Mistaken tenderness, foolish pride, or a dislike to exact the tasks which the child may dislike to perform, with other motives intervene. It is very often the daughter whose services could be dispensed with, from a pecuniary point of view, who helps about the cooking and mending, looks after the dusting and the table, interests herself in true sisterly fashion with the younger children, and delights in all housewifely accomplishments, while maybe her schoolmate, born and bred in a household where her services would seem to be indispensable, is relieved of both care and toil in this direction.

Yet such a course is not only unwise; it is unjust both to the child herself and to the rest of the household. She is missing her first, best chance for domestic attainment; the mother rest and leisure and daughterly sympthy; and the family the real, solid, daily comfort the child might learn to secure. But even with the best intentions on either side, better results might often be attained by better methods. There are some points regarding which a few suggestions might be made, even to the most judicious mothers, and such are readiest to learn.

And, first, it is not to be expected that the art of housekeeping can be mastered by even the most diligent use of a school girl's leisure persisted in through girlhood with the long vacations thrown in. At best, experience, nowhere more essential, would be lacking. And, moreover, in the time at her disposal, the girl can perform each week but a very small part of the actual house-work. A certain part she may do; and if there be more than one daughter it may be of appreciable value to a systematic housekeeper.

Right here comes my principal caution: Do not let the daughter have the very same tasks from week to week, from month to month, from year to year. Vary them, so that her duties may include, in time, as large a proportion as possible of the housekeeper's varying tasks. And if there are several girls, is it not better for them to change work occasionally? Better for their own discipline, surely, though each prefers her congenial work. Because Alice will dust a room more deftly, while Emily wields the broom with admirable energy, is no good reason, other things being equal, why Emily should not learn the care and skill that insure a dustless, inviting parlor, or Alice, in her turn, learn to sweep corners, back rooms and all, and gain maybe muscle and vigor in so doing.

Nor do Effie's culinary accomplishments, much as the household enjoys them, justify the mistress of the home in excusing her from all chamber work and from mending and sewing. And it certainly is not fair to put upon one all the wasning of dishes. There might be a rotation as well as a division of labor, especially in vacation times.

And again, because mother can cut and baste so expeditiously, and always get the best results from any given quantity of cloth, ought the daughters, therefore, *always* to insist on her doing such work for them? Would they not better acquire a little of her ability, even at the cost of a yard or two of goods? And do they leave it to her to plan and to perform all the "extras?" The making of bedding of different sorts, the planning of carpets and laying the same, and all bits of work relating to house-furnishing, the annual preservings and lard-tryings, and sausage and mince-meat making, the care of the table linen and many another duty, are included in this long, broad, high art of housewifery. And the maiden who aims at perfection therein will do well not to neglect them.

And it seems to me that though mother's judgment is best and safest, yet the daughter ought to be gaining a little of her own in the way of household shopping. How else is she ever going to know about these things—the right sort of goods for different purposes, the varying qualities, and the reasonable prices to pay therefor?

Ah! it takes time and patience, and a willing heart and hand to learn it, this home-making and home-keeping; but rightly learned, is it not its own reward?

OUTINGS IN NEW ENGLAND.

VIII.

MARY WAGER-FISHER.

FROM Brant Rock we turned our steps inland, going by a zigzag route to Middleboro, the country presenting a better appearance as the scrub oaks and stone fences of the coast farms were left behind. Everywhere there were apple trees loaded with fruit, and although the land must be in fact more productive than it is popularly supposed to be, still the New England farmers cannot compete with those of the West, and so all Yankee-land has practically become a manufacturing district. Nevertheless, I was everywhere impressed with the idea that the young native-born women of Massachusetts could do better in every way by cultivating small fruits than by toiling in the factories, as so many of them do—there is such a vast population and it is so generally distributed as to make markets everywhere accessible.

There is nothing about Middleboro to make it more interesting than the average New England village, and the attraction there for us was a white-haired man whom we loved, who had been an attached friend of Agassiz—a man who was wise in scientific things and had traveled far and wide, and he often said that of all the wonders in Nature that he had seen, he regarded the volcanic regions in the Sandwich Islands as the greatest. During the few days that we were his guests, he entertained us with many interesting reminiscences of his own history and of the surrounding country, which abounded in Indian incidents. We were shown a spot in Assawampsett Lake, where an Indian who had been educated at Harvard, was put under the ice and drowned by hostile Indians who thought that he had revealed their plan to the whites. Near the lake a house had been recently torn down, which was built in 1645. The original cedar shingles were still on it, and the house had never leaked, although the shingles were worn to stubs. All throughout the country, the population had decreased, two-thirds flocking to the towns, or migrating "out West." Still, nowhere do people live longer than in New England,and in Massachusetts, particularly, the educational advantages are so good as to be in fact absurd! In the county in which Middleboro is located, for example, each township is required to have a High School in which tuition and books are free, and in addition, transportation to and from the school is furnished to all pupils who live too remote to walk. That year, the Middleboro people had been taxed $800 to defray railway and carriage transportation expenses for High School pupils. Education is probably valued, like everything else, in proportion as it costs the possessor effort and sacrifice, and an outsider cannot help being curious to see how the Massachusetts munificence will result. The famous little man, known as Tom Thumb, lived near Middleboro, and his yachting box was still standing on the lake. The dwarf Warren girls, Minnie and Lavinia, one of whom he married, belonged to a family named Bump, who lived in the neighborhood. They very sensibly preferred their mother's name of Warren. It is a very common-sense fashion that prevails in Spain,for instance, that when a man and woman marry, the name of the wife, when it is the better of the two, becomes the name of the new family founded by the marriage, and when a man has an outlandish name, he should be glad of an opportunity to drop it for another. When the Warren girls were born, they were regarded by their parents—who were of ordinary stature—as great misfortunes. But as it turned out, they were undisguised blessings, being very kind to their parents, whom they surrounded with every comfort.

Among the reminiscences of our host, was one of his youth, when he was but 14 years old, the second week in May, 1833, on a Potomac river steamer. On the same boat were the Indian chief, Black Hawk, his son and other chiefs who had been taken as hostages by the government to insure the keeping of the treaty made under General Harrison, and they were being taken to Fortress Monroe. "The faces of Black Hawk and his son," said our friend; "were deeply impressed on my memory; Black Hawk was crafty and shrewd; he was rather small and stooped. His son was over six feet tall, straight and stout, and he wore a blanket with the figure of a large hand on the back of it. While on board some of the officers thought they would have fun with the Indians and called Black Hawk down and 'treated' him to wine until he became boozy; then they sent for the son, who came, and they offered to 'treat' him; but straightening himself up and drawing his blanket about him, he shook his head scornfully. They insisted on his drinking, when putting his finger out of the blanket he pointed at his father, and again shaking his head, he stalked scornfully away, wiser than the guzzling officers. I never witnessed a more powerful rebuke."

From Middleboro we went to Wood's Holl, the most southerly point on the Massachusetts coast. Holl is Dutch for hole, bays and coves being called holes. At Wood's Holl the United States Government has a Fish Commission building, where cod and lobster are hatched, and where in glass tanks a great many curious fishes are kept. Of peculiar interest were some squid, perfectly transparent, and the swell fish, so called, because when taken out of the water it fills itself full of air like a ball, from indignation, probably. At that time the ship employed in deep sea dredging was in the harbor, and having gone on board, we were courteously shown the methods employed in this most fascinating work. One of the officers said that sea life was more varied and interesting in the vicinity of Wood's Holl than elsewhere on the Atlantic home coast.

From Woods Holl we sailed for Martha's Vineyard seven miles distant, on the steamer Monohassett, which at the outbreak of the Secession War, had been used as a transport. After a charming sail of an hour or so, the steamer reached the Vineyard and touched at Cottage City, which from a camp-meeting ground has grown into a city of summer cottages. Here we disembarked, but tarried for only one day, owing to the discomfort and poor fare at the hotel in which we were quartered at the rate of $4. "per head" a day. It was at the end of the season, and it was not thought worth while to cater to the wants of a few stray tourists. But in a few hours one can get a very good idea of this unique city of 1,500 cottages, of all sizes and styles, from a tent to a villa, with streets, water, gas, stores, etc., in first-class municipal fashion—a charming place, indeed, for recreation and rest, if one doesn't wish to get away from people.

From the Vineyard we sailed on to the island of Nantucket, 30 miles from the mainland, which has a charm all its own, and is thought by many to be the loveliest summer outing place on the coast. The old town of Nantucket, built on a gentle ascent from the shore, and for years the home of men who roamed the sea for whales and fish of smaller fry, is now invaded by summer saunterers, who not only hire every old house to dwell in, but buy as much colonial furniture and bric-a-brac as they can well carry away, and all New England is fairly ransacked for heirlooms and relics to satisfy the demands of rich tourists, old sofas, chairs, tables and bureaus being sometimes sent as far away as California.

CONCERNING OURSELVES.

OLIVE E. DANA.

WE have all of us our pet economies, and our pet extravagances. We have all our own follies, and, alas! our sins. "It seems very sad to me," said a lady to whom was told some sad failing of another, "but I suppose it's because that's not my way of sinning." Was it George Eliot who said: "We need to hear the excuses men make to themselves for their worthlessness?" We do need to know the circumstances and the influences that have helped to make men and women just what they are, and since that is not always or often possible, we need to have a kinder charity a tender and more constant forbearance, with others, knowing and remembering that we do not know what stern trials have made them pitiless or despondent, what narrow routine has limited both comprehensions and sympathy; what disappointments have embittered and discouraged; what unanswered longings render them unhopeful. And we do not know how they have striven amid or against such conditions, or how much grander may be their seeming defeats than our petty victories.

Their patient endurance may have more real valor and faith in it than all our pleasant words of cheerful trust in happier ways. Sojourning over by the sea-shore, I noticed how oftentimes when the sea looked calm enough from my window,the sail-boats were tossing about its waters, in a way that betokened real force and turbulence underneath them, and sometimes it was wonderfully serene when, looking out upon it, I had not dreamed it was so still. It may be so of human lives; It is not always apparent from a little distance which is troubled and turbulent and which is calm and serene.

On a little island where the river flows into the sea, a mere mass of heaped up stones, as it seemed, with but a little earth in the interstices, I saw fir trees growing among the shelving rocks. It was a stunted growth after all; yet the wonder was that they lived and thrived at all in any vigor or greenness. So of the fruit of human lives. Only the One Husbandman has a right to condemn: only He knows out of what poverty of soil it was put forth. Yet who of us is ready to say of herself that she has done and is doing all that is possible. If nothing more in the way of task and service, no more of the actual work of the world can be required of her, what better fruit of gentleness and patience, of endurance and helpfulness, of earnestness and faith some of us might render!

GOLDEN GRAINS.

How loved, how honor'd once, avail thee not;
To whom related, or by whom begot;
A heap of dust alone remains of thee;
'Tis all thou art, and all the proud shall be!
Pope.—

BLAIR says that such is the infatuation of self-love, that, though in general doctrine of the vanity of the world all men agree, yet almost every one flatters himself that his own case is to be an exception from the common rule.....

THERE is no action of man in this life which is not the beginning of so long a chain of circumstances, that no human providence is high enough to give us a prospect to the end.

MAY all who read this resolve to begin the day with prayer, for it is the golden key that unlocks Heaven to pour down blessings upon us, and end the day with prayer, for it is the same golden key that locks us up under Heaven's protection at night.....

Is it not true,as Plutarch said, that if we hate our enemies we will contract such a vicious habit of mind as by degrees will break out upon those who are our friends, or who are indifferent to us?.....

THE CHRISTIAN UNION says that a world which has a God over it, and a life which has a God in it, have no place for despair. Loss, calamity, grief are not excluded, but these do not bring the message of despair. Despair comes only when there is no longer any hope, and no possible issue out of adversity but permanent and eternal loss. Despair may be the necessity of atheism; Christianity, which makes the cross of shame and death the symbol of triumphant immortality, has no place for it. "For sudden the worst turns the best to the brave."....

THERE is no friendship that is strong enough to get along unless it take faults for granted. Saints may be plenty in heaven, but they are very scarce on earth, and if you are going to form friendships you must form them so that they will be able to swallow up the faults of those you love.... .. ..

BISHOP DOANE concludes that to be a gentleman does not depend upon the tailor or the toilet. Good manners count far more than good clothes.....

SCOTT said that when the hour of trouble comes to the mind or the body, or when the hour of death comes, that comes to high and low, then it is not what we have done for ourselves, but what we have done for others, that we think of most pleasantly.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

AVOID conspicuous and popular styles in dress.

MAKE your traveling dress as simple and plain as possible.

IF you are limited to *one* good dress, select one of black goods.

WE have never been able to understand why a fairly sensible girl will crowd her feet into shoes too small for her. She loses thereby freedom and elasticity of gait; renders herself ill at ease, and does not diminish or improve the shape of her foot one whit—the bulk is there, and if restricted in one direction, it will bulge out in another. Altogether, girls, the torture is worthy of a better cause.

AS we sat cutting seed potatoes for our contest plot not long since, memory carried us back through long years to early days here when, with hearts filled with only one thought, one love—the founding and successful establishment of a home—we worked early and late, not stopping to choose our tasks, but doing with all our might—imperfectly it is true—whatever came to hand, whether it were cutting and planting potatoes in our little garden, directing the workmen, or attending to house duties. The first named occupation (how many others we have never known) struck some of our good neighbors as particularly unfeminine and one that a sane young woman reared in the city and in comfortable circumstances would not voluntarily undertake to do. "Her husband compels her to do it," was the gracious verdict pronounced by this self-constituted jury. And so from time to time we have heard this story and it even traveled to our girlhood home and the writer was commiserated for having made so unfortunate a marriage. Sad, so very sad!

Thus it is that a person, having different aims, different tastes and who leads an altogether different life from those around him, is misjudged. We were new-comers and were voted decidedly queer because we spent so much time in the fields and woods; because of our disregard of fine clothes and conventionalities; our evident disregard of the formalities of society. Our devotion to our home and to each other seemed never to enter into their account.

EXTRACTS FROM SUNDAY EVENING TALKS AT THE RURAL GROUNDS.

"FINALLY, brethren,whatsoever things are *true*,whatsoever things are *honest*, whatsoever things are *just*, whatsoever things are *pure*, whatsoever things are *lovely*, whatsoever things are of good report; if there be any virtue, and if there be any praise, think on these things." Each clause of this verse is a sermon in itself. I shall notice the first three and consider the remaining clauses only as incidental.

This verse,from the fourth and last chapter of Paul's epistle to the Philippians, is the beginning of his final exhortation to them. The letter to the people of Philippi was written or dictated by Paul during his first imprisonment at Rome, in answer to expressions of sympathy and a substantial gift. It is a letter in which are mingled grateful affection, personal sorrow, joy, gloom and anxiety caused perhaps by the exceedingly rigorous and increasing severity of his treatment during imprisonment. Philippi was one of the chief cities of Macedonia. It was the scene of the last struggle of the Roman Republic. It was where Brutus and Cassius, having been defeated by Antony and Augustus, committed suicide. Then it became a Roman "colony" (so called), governed by Roman magistrates and laws—in short a miniature Rome. The Jews were few, and were not allowed a synagogue in the city; but outside the gate in a secluded spot by the bank of the river, they had a small chapel. It was here that Paul and Silas were the means of Lydia's conversion. In Philippi they came in contact with paganism in its worst forms; but fearless, they went about preaching the gospel until scourged and imprisoned. We all know the story of the jailer's conversion. It seems as though the very work which the Roman authorities tried to suppress, was fostered by the means they employed to do so; for the incarceration resulted in the founding of a faithful Christian community. It was to these few worshipers that Paul's epistle was addressed.

Now, nearly 2,000 years after apostolic greatness, has this letter of the greatest apostle lost any of its significance? Is this one verse less applicable to the people of to-day than it was to those of Philippi? Is it not *more* so? If in those days of miracles, words of exhortation to "stand firm," to be steadfast, immovable, were necessary, how much more in need of them are we to-day, never having seen any tangible workings of God!

"Whatsoever things are true, whatsoever things are honest." Think on these things. It seems to me that if those two injunctions were not only thought of but *practiced* in all the dealings of mankind one with another, the disappointed, unhappy faces would be changed to joyous, hopeful ones. Aside from the question of its being morally right to be true and honest, see the practical results that would come into our own lives, if we practiced what the apostle teaches.

Is it the friend who tells us candidly, unreservedly "the truth and nothing but the truth," upon whose word we feel we can depend? Or, is it the one, who, politic, puts forward the side he thinks will be most agreeable, the least liable to offend, stretching it, distending it; covering up, smoothing over, even leaving out entirely the points in any way unpleasant?

Though the truth may "hurt",(as the old expression goes), I fail to see how any one can prefer or desire equivocation.

When I was a child, I heard one lady say of another; "She is one of the few people who tell the unvarnished truth." I can remember thinking about it and wondering if it were really so, and how any one could say things that were not exactly true or put a coat of varnish over the real truth. I fear that a moment's thought will bring to our minds people of whom and of whose words we feel distrustful; but I rejoice in the fact that we can also name a number of those for whom we would vouch.

People of equal candor, honesty and truth of course have different ways of expressing their views. Some are in manner pleasing, gracious, careful, considerate; others short, blunt, unpalatable. It is the latter class that are more misunderstood and I may safely say, more unpopular, than any other class of really good people. Two friends of mine whom I most highly esteem are pretty nearly

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria
When she was a Child, she cried for Castoria
When she became Miss, she clung to Castoria
When she had Children, she gave them Castoria

true representatives of these two classes of whom you have heard.

I have never known an instance in which either was the least bit insincere. I can go to either with perfect assurance of obtaining an earnest, honest opinion. Yet I know of no two good people so totally unlike in the expression of those opinions. One is, I might almost say, the personification of gentleness, yet just as firm and decided in her truth and candor as my other friend, who will tell me in the fewest words possible, it seems, exactly what she thinks. I could mention a number of instances in which these two persons have been asked what we call "embarrassing questions," or placed in trying, delicate positions; the answer or the action was invariably genuine truth itself. It seems a very easy thing to be true and honest, but *is* it? Judging from the vast majority of people, who, if not dishonest are insincere, it would appear not. It is a fact to be deplored. It should not be so. In my little experience I have not found it a hard matter to teach children, as a rule, to be truthful. I say as a rule, for heredity is a force—a power that sometimes cannot be overcome.

Take children of all classes and conditions, from the highest to the lowest, from the richest to the poorest, get a hold on them, trust them, let them feel that they are relied upon, and properly directed, it will not be long before positive lies give place to certain truth. It is a notable fact that children of wealthy, "society people" are more apt to equivocate and are more difficult to break of the habit, than the children of poverty, or of the middle class. Is it to be wondered at when there mammas deliberately send a servant to the door to say: "Not at home?" Those same children, perhaps, would think it dreadful to tell a *lie*. The would-be politeness of their parents seems to them entirely proper, and they are often taught just such untruthful things, as being mere necessary conventionalities.

If it be true then, that children are *naturally* honest, it follows that insincerity (equivocation, dishonesty, untruthfulness, call it what you will) is developed in mature years. The prophet Jeremiah says: "The heart is deceitful above, etc., who can know it?" Is not the whole matter summed up in these few words of Shakespeare?

"To thine ownself be true; and it must follow as the night the day, thou canst not then be false to any man."

"Whatsoever things are just." We may be true, we may be honest, but it is much more difficult to be *just*. We all believe, or *want* to believe, that God is a just God. Where do we find another embodiment of justice?

We know many who want to be just, but are they?

We know that we want to be just, but are we?

Who is to decide?

In that, as in many other things, we can only do "according to our light."

ABOUT DINING.

THERE is one place where I visit that I always leave with regret mingled with a keen sense of anticipation—regret that I must go, and anticipation of the next time I'm to spend 'neath that cottage roof. My friends are not wealthy, though in good circumstances, yet one comes away with the feeling that everything in that house is perfect. The sense of "home" pervades the whole place. There, little "dinners" or "teas" are always a success, and I've found out some of the things that make them so, and will tell them to you.

First of all, see that the table linen (it need not be the finest damask) is spotless and fresh; that the china, glass, silver and cutlery are bright and untarnished. Arrange the dishes gracefully: do not place them at equal distances from the ends or sides of the table—nor in exactly right-angular positions, but put them where they will look most inviting. A pretty table scarf embroidered in some vine-like pattern thrown across the table diagonally from one corner to another, adds wonderfully to the brightening of the board. Always have flowers if possible somewhere on the table. Those of you living in the country can always have these during the summer time, at any rate. A great bunch of clovers and grasses makes a lovely decoration; or a vase of dark maiden-hair fern, smelling of the woods, will bring a sense of coolness that is delightful.

Have enough dishes, but a profusion of them is as bad as a scarcity.

Care should be exercised in selecting your guests. They should, if possible, be all sensible, social, and unaffected, else they will not contribute greatly to the pleasantness of the entertainment, and it will be likely to appear formal and stilted. Care should also be exercised in placing the guests at the table. The great point is to pair amiable, pleasant and agreeable people. Arguments should not be tolerated at the table, as they destroy the appetite and spoil the digestion to say nothing about ruffling the temper. Never invite any one to dine simply because he is rich; never invite people who have not the instinct of gentlemen and gentlewomen—they may have such instinct even though occupying humble positions.

Do not hasten through the meal as though you were at a rail-road depot and had just "10 minutes for refreshments." Good talkers are a great acquisition at a dinner, but so also are good listeners. I shall not talk about the different courses, as I know that very many farmers and their wives, who read this, cannot so arrange matters as to permit having their dinners so served, but the other hints I have given can be followed by them as well as by any one else.

A prettily arranged table gives one an appetite. Always have a salad at dinner. There are many kinds that are easily supplied, but lettuce is a stand-by. Lettuce served with water-cresses is a dainty and toothsome finish to a dinner. Garnish your meats with something green—water-cresses or parsley will do nicely.

To do these little things, I know, may seem useless to a poor, tired housewife and mother who has to get up in the morning at five o'clock (perhaps before, so that the men may have breakfast in time to go to the fields, or do the milking, or go to market, but if she cannot follow my suggestions every day in the week, let her try to have her Sunday dinner so bright and cheery that it will be something to look back on during the week, and something to look forward to also. Care about dining does more to refine the boys than all the lecturing one can give. Then, too, if the children are brought up with care in regard to their table manners they are never afraid of making blunders when they go to see their "city cousins," and will not be dreaded by said city cousins as that much laughed-at terror—the "country cousin."

DORA HARVEY VROOMAN.

ON TIME.

LAST summer I spent a part of my vacation at a little city not far from home, and when the time for my departure drew near, I asked the man of the house at what time the train would leave. "At precisely 5:30. It never leaves at 5:29, or 5:31, but *always* at 5:30. If you are there one minute before, you will be in time; if you are there one minute after, you will find the cars gone—if that is not an Hibernianism to find what is not there." Now, it seems to me that people employed in other business should know as much as those connected with the railway; at least, they should be as careful to be on time. But what a woful neglect of punctuality do we meet every day of our lives! People are shockingly off time; but whether it results from carelessness, thoughtlessness or indifference, the sins, both of omission and commission, are there and should be corrected and at once, the sooner the better, for the more a person allows himself to be off time, the harder he will find it to be on time when it is a necessity.

I know, for I have found it to be so myself. As we live at a distance of about five minutes' walk from the academy, very often I would not start for school until five minutes before it opened, and just as often as not I would be a minute or so late—only a minute, but just enough behind time to give me a tardy mark, and the way those tardy marks counted up when the records came in was something frightful. At any rate they frightened me, and I resolved to make one grand effort to have a record that said "on time" the next month. And I did, and for all the months thereafter. Common sense—poor abused term!—should teach people to keep their appointments and to keep them on time.

Some people do not seem to consider that others' time may be valuable if theirs is not, and that much inconvenience and trouble may occur because of their failure to keep an appointment promptly on time. People ask us to meet them at a certain place and at a certain hour and we do so. Perhaps half or three-quarters of an hour after the time agreed upon, they may make their appearance. Do these laggards even stop to think that the time may have passed very slowly to us; that we might be better employed than waiting, waiting, waiting!

Friends promise to visit us, and say they will come on a certain train. We go to the station to meet them; the cars arrive, but they do not, and it is with a feeling of disappointment that we return home. And ordinarily, there is no excuse for their non-appearance but their own carelessness; they missed the train by being a few minutes too late. Well, they should have borne in mind the fact that "time, tide and railway cars wait for no man."

Money is due which is promised to be paid on a certain date; but the date passes and the money comes not. Do these delinquents ever think of the dishonorable nature of this transaction? Do they realize how much may be depending on the receipt of the promised sum? Of course, there are occasions when it becomes impossible to fulfill a money promise, and in such cases, a full and perfectly truthful explanation should be given, and if such explanation be wanting, the delinquent may be safely written down—a scamp.

A person can gain a splendid business reputation by being always on time. Business people require and need punctuality, and when they find that their employés are lacking in promptness, that they do not value their employers' time and their own situations enough to make a proper effort to retain them, they are dismissed and others are found to fill their places, and the popular verdict will be "served them right." I believe success will crown our efforts, if we will only be on time. "Delays are dangerous" in four cases out of five. If we traced the careers of our successful business men, I think we would find the most successful to be those who have been always punctual, always on hand when there was any chance of bettering their position, always on the lookout for their employers' benefit, regarding the hours for which they were paid for their services as their employers', not their own, and consequently, always on time.

Do you ask, "Are you always on time?" Oh, I'm not a *rara avis*; and, besides, don't you know some things are a great deal easier to preach than to practice?

SADIE E. STEIGLEDER.

YOUR TOILET
Is incomplete without a bottle of
AYER'S
Hair Vigor.
It preserves the hair, keeps the scalp clean, and is everywhere the favorite dressing.

"I have used Ayer's Hair Vigor for promoting the growth of the hair, and think it unequaled. For restoring the hair to its original color, and for a dressing, it cannot be surpassed."—Mrs. Geo. LaFever, Eaton Rapids, Mich.

"I was rapidly becoming gray and bald; but after using two or three bottles of Ayer's Hair Vigor my hair grew thick and glossy and the original color was restored. I have no hesitation in recommending this dressing."—Melvin Aldrich, Canaan Centre, N. H.

News of the Week.

HOME NEWS.

SATURDAY, June 1, 1889.

LAST Saturday the steamer Greytown left this port for Nicaragua with the first installment of men and machinery to be employed in the construction of the Nicaragua Canal The estimated cost of the work is$66,000,000—probably not more than one-third or one-fourth of what it will really cost, should it ever be completed, and it probably will. The Panama Canal appears to have completely collapsed. All of the laborers and other employés who could get away at their own cost or that of their respective governments, have done so, after many of them had been nearly starved to death; the excavating, transportation and other sorts of machinery are going to "rack and ruin," gravitation and weather are filling up the "cuts," the rank vegetation of the tropics is covering every thing, even the graves of the 15,000 employés who perished in the work, and the "big ditch" in which over $300,000,000 have been sunk, is going rapidly to ruin. Only about two-thirds of the proposed work on it has been done and De Lesseps can raise no more money to help it along, and the French Government, warned by this country, will do nothing in its favor until the next French election in October, if it will do anything even then. It looks now as if it would remain a tremendous memento of folly or bad management, unless the project is completed by other people after the "privileges" of the original stock-holders have been forfeited or "bought for a song." It's not altogether unlikely that "Americans" may finish the work and "make a good thing" out of the losses of the unfortunate French investors..... Carnegie, the great Pennsylvania iron operator, whose income amounts to over a million a year, and who began with "nothing," has reduced the wages of his men by an average of 20 per cent. They must accept his terms or "go out" and starve.....Hitherto Pennsylvania has been the head-center of the iron and coal business of the country, but the "South"—and especially W. Va. and Ala. —is rapidly becoming a dangerous rival. Owing to the proximity of iron and coal in the same neighborhood, together with lime to be used as a flux, iron in all forms can now be made in some parts of the South considerably cheaper than in the Keystone State..... The Southern railroads, too, anxious to build up a business that must greatly benefit them in the future, give much lower rates of freight on iron of all sorts than those given by the Northern roads. so that among "Northern iron men" there is a good deal of talk, even in Pennsylvania, of transferring the whole,or a part, of their business to the most eligible sections of the South, West Virginia, Northern Georgia and Alabama being the favorite locations. Colored labor is used a great deal there in the "works," and is cheaper than white labor and less liable to disorganization by strikes, and white operatives in "shops" in the South are much less likely to strike than the same class in the Northern factories. A question of the day, therefore, is, "Is Pennsylvania moving down to Alabama?"..... The English and American salt syndicates or trusts have come to the most amiable agreement. Each will do what will tend most to the benefit of the other, and both will in the friendliest way, make the greatest possible profit out of the "dear public."..... At Bellville, Ontario, Canada, the other day, 17 persons were injured in a railroad accident .....The broom-makers of Western New York propose to form a trust, though, of course, they are unwilling to own it..... Down in the French negro Republic of Hayti, after numerous serious reverses and a multitude of needless butcheries and atrocious cruelties, according to reports, the tide of success is setting strongly in favor of Hippolite who has been generally regarded as a "rebel," and against Legitime, who has been looked upon as the legitimate President. It looks as if the former who occupies the Eastern part of the Republic, contiguous to the Spanish negro Republic of San Domingo, will soon drive his rival out of the country or "to the wall." The other day, on the advice of Secretary Blaine, President Harrison appointed Gen. Lew Wallace and the "Col." Beverly Tucker, as Commissioners to visit Hayti and negotiate peace between the warring rivals and also secure three excellent coaling stations for this country; but there is a big hitch in the matter, which some attribute to the recent great successes of Hippolite, while others say the trouble is due to the fact that Tucker was a very bitter "rebel" at the close of the late war..... A company has just been organized to push ahead preparations for the next great International Exposition to be held in Washington in 1892, to celebrate the 400th anniversary of the discovery of this Western Hemisphere by Columbus. The liberality of our government as well as of the American people in dealing with all foreign big shows of this kind, at London, Paris, Brussels, Barcelona and elsewhere, will, it is thought, induce other countries to make liberal contributions of money and products to the great Columbian Exposition of 1892.....The Connecticut House has passed a grade-crossing bill which places all the cost of making the necessary changes upon the railroads ..... It looks as if the Standard Oil Trust were destined, ere long,to get control of all industries involving the production of all materials which can be monopolized by enormous capital directed by great money-making ability aided by unscrupulous conduct and stimulated by insatiable greed. To petroleum, cotton oil and dressed meat monopolies the magnates of the trust are about to add one in white lead. They want to exact a tribute from every man who paints his house..... .....

It is said that all the cabin accomodations of all the trans-Atlantic steamers are already pre-engaged for the next three months. Probably 100,000 Americans will visit Europe this year, each of whom will spend, on an average, $1,000 for expenses, clothing and other things to be brought home—$100,000,000 to be spent abroad !.....Two bank cashiers, one at New Haven, Conn., and the other at Scranton, Pa., have been arrested within a few days charged with embezzlement of $100,000 each. Both were eminently respectable, of course, ornaments of society and pillars of the church. In both cases the directors of the banks would have thought it outrageous to keep a sharp eye on such models of propriety; but they'll have to pay heavily for their over-confidence all the same. .....To the South Dakota Constitutional Convention, to be held at Sioux Falls on July 4, 72 delegates have been elected, of whom 35 are Republicans and 22 Democrats. To the North Dakota Convention to be held at Bismarck, 82 delegates have been chosen—54 Republicans, 24 Democrats, two Republican-Prohibitionists and two Prohibitionists.....Harvey W. Sage, the Ithaca millionaire, has given Cornell University $300,000 for the endowment of a library. His benefactions to the institution now amount to $1,000,000 ....."Henry Georgeism" has a firmer footing in South Dakota than anywhere else in the country..... That English brewery-purchasing syndicate has just added $4,000,000 worth of beer-making plant at St. Paul, and $1,000,000 worth at Detroit to its enormous holdings.....

Actions Speak Louder Than Words.

Anything that serves to recall a maxim, works reciprocally: the maxim is all the more a maxim and the thing itself receives that much endorsement. Now, for more than purposes of illustration we get as close to the above as is possible.

Our purpose is to impress you with the value of Compound Oxygen, and naturally, after what we have just said our manner of procedure must be, that our patients in the past and present, are our endorsements.

Here you have it; and concerning the following we may quote, "For they themselves have said it:"

WILLISTON, S. C., March 20, 1888.
"I am pleased to report a continued improvement both in myself and wife. May you live long to bless suffering humanity with your Compound Oxygen. "Rev. W. W. GRAHAM.

GASONIA, GASTON CO., N. C., May 25,1888.
"I sincerely believe that had it not been for the Compound Oxygen, I would have been in my grave before this time." W. D. HANNA.

REISTERTOWN, MD., Feb. 29, 1888.
"Two doctors of Baltimore examined me and said mine was a hopeless case of asthma. Now, almost two years after using only one treatment, I think I can truthfully say my health is as perfect as it can be on earth."
MRS. MARY R. IRELAND.

PORTAGE, WIS., Jan. 30, 1888.
"My wife has been taking your Compound Oxygen for over two years for consumption and has derived much benefit from its use. In fact, I think she would have died long ago but for it." H. D. JAMES.

We publish a brochure of 200 pages, regarding the effects of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever,headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 120 Sutter Street, San Francisco, Cal.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, June 1, 1889.

THERE is a shortage in the Australian wheat crop, of about 1,000,000 bushels, but this will probably be made up by New Zealand which has a surplus of about 4,000,000 bushels. The average yield in Australia is placed at less than eight bushels per acre, while that of New Zealand is given at 25 bushels. There will be but little wheat exported to Europe. There is also a shortage of feed. Three cargoes of California wheat have been received at Sydney..... The largest crop of wheat ever raised in South Russia was produced in 1888, and the transportation facilities are so inadequate that it is estimated that one-fourth of the crop is yet in the producers' hands. The demand from that country for agricultural implements of all kinds, especially harvesting and thrashing machines, is very great..... The question of the abatement of the rabbit plague in Australia seems no nearer solution than ever. The royal commission report that no evidence is found that any known disease can be employed to exterminate rabbits..... The Arkansas Station proposes a novel warfare against scrub cattle. It will encourage the spaying of cows and heifers and also encourage the cotton-seed-oil mills to buy the spayed cattle for fattening purposes..... The Holstein breeders offer liberal prizes for best specimens of that breed of cattle shown at the fairs. T. B. Wales, Iowa City, Iowa, secretary.....The Western weed that furnished food for the Colorado potato beetle before it began its march to the East, is now following in the wake of the other pest..... The Michigan legislature has appropriated $8,000 for the erection and equipment of an agricultural laboratory at the Michigan College.....A Short-horn cow sold for $2,500 at a recent Chicago sale .....American breeders of Hereford cattle will make an organized effort to secure the South American trade for breeding animals.....The American Jersey Cattle Club has reduced the entry fee on imported cattle to $25 for animals of either sex..... The visible supply of cotton both in this country and in England is said to be smaller than at this time last year.....Assistant Secretary Tichenor has affirmed the decision of the Collector of Customs at New York assessing a duty of 15 per cent. on so-called sausage casings. They consist of long tubes of paper treated with sulphuric acid, and as manufactures of paper, were subject to duty. .....A Holstein cow is reported with a milk record of 30,318 pounds eight ounces in one year. The service fee for a son of this cow is only $500. Why shouldn't farmers grade up their stock?.....During 10 days in the fore part of May, from 80,000 to 100,000 South American hides were sold in New York and Boston. The bulk of them sold for 15½ cents which is said to be the lowest price for more than 30 years. The stocks on hand are very heavy.....Governor Bulkley of Connecticut, vetoed a bill prohibiting the coloring of oleomargarine to resemble genuine butter and cheese, because oleomargarine has been pronounced a healthful article of food; that the present law prevents its sale under false pretences, and prohibiting its manufacture entirely would be detrimental to the interests of the people. The bill was passed over the veto by about thirty majority in the House, but it failed to pass in the Senate..... The Connecticut board of Agriculture sent a series of questions to each town clerk in the State in regard to the number of dogs, tax paid, etc. From partial reports obtained we learn that 2,119 sheep were killed, maimed 531. Damages paid by towns for sheep killed and maimed $10,729; by owners of dogs $636. Number of dogs registered 32,415, dog tax collected $41,100. Number of sheep in the State 50,000.....American apples are said to receive such rough handling before and during shipment, that they are so badly bruised as to preclude the possibility of keeping them any length of time.....The affairs of the Pacific Guano Company are still in an unsettled condition, and there seems to be no prospect of re-organization..... Any exhibition of dairy products at the Paris Exposition must be made by individual exhibitors. Exhibits should be shipped by the vessel leaving New York June 15, and should be on board the preceding day. They should be put in sealed packages, and then packed in a double case with air space between. Shipping directions may be obtained from Dr. D. E. Salmon, Department of Agriculture, Washington, D. C..... It is reported that the east-bound roads from St. Louis will make a grain rate of 23 cents to New York, being a cut of five cents..... There was a heavy frost in Niagara county, N. Y., May 29. The thermometer was but little above the freezing point, and much damage must result.....The semi-annual meeting of the Missouri State Horticultural Society will be held in Brookfield June 4, 5, and 6; a very interesting programme is presented.....At Mason City, Iowa, an old brewery has been converted into a creamery..... According to the English papers, Russia is making an effort to build up an export trade in pork.....The Nebraska State Fair will be held at Lincoln, September 6 to 13. Robert W. Furnas, Secretary, Brownville.....Insurance against hail is becoming very popular with florists who have much glass exposed in their green houses ..... The Queens County Agricultural Society will hold its 23d summer exhibition at Mineola, Long Island, N. Y., June 19 and 20. The display of flowers and strawberries is expected to be very large..... ..... The Massachusetts legislature has passed an act forbidding the docking of horses' tails, with penalty of fine and imprisonment for violation.....A Pennsylvania young man who overdrove a livery horse was well ducked in the horse trough on his return from the ride.....England wants to get along without American corn. Chemists are called upon to formulate a cheap cattle ration that shall leave corn out.....The Linseed Oil Trust has advanced the price of oil one cent per gallon. This trust has compelled some crushers to import seed from South America. .....In some local markets at the West there has been a small potato boom. Prices were so low that farmers began to feed potatoes. The consequence was, that as nobody sent to market, the stocks ran out, and the price ran up .....The Pennsylvania legislature has passed a law providing that no person shall, without the consent of the owner, offer for sale any milk can, butter tub or box used for the transportation of milk, cream, butter or other produce having the name and residence of the owner stamped upon it, nor shall any person wilfully use cans, tubs or boxes for his own use without the consent of the owner.....

CHICAGO, ILL.—BUTTER.—On the Produce Exchange to-day the butter market was generally firm; Elgin creamery, 15½@16½c; choice Western, 12½@15c. choice dairy, 12@14c; common to fair, 8@10c. Eggs firm at 12@12½c.

LIVE STOCK MARKETS.

NEW YORK, SATURDAY, June 1, 1889.

BEEVES.—Dressed Beef in good demand and prices a trifle higher than last week. Medium to Prime sides sold at 6½@7¼c, and choice carcasses reached 7½c; but the bulk of the transactions were at 6½@7c.

CALVES.—The extremely favorable weather and the light supply and high prices of lambs buoy up the Calf market, and it is well sustained. Buttermilk Calves sold at 2½@3½c per lb; Prime to Choice Veals at 5@5½c. The market is liberally supplied with city dressed Calves; but prices are fair, dressed Buttermilks selling at 4@5c, and Veals at 6@8c, and even up to 8½c for extra stock.

SHEEP AND LAMBS.—Trading limited for want of stock. Steady for sheep and 2½c higher for lambs, which continue in light supply. A carload of common Ohio Sheep sold at $4 50 per 100 lbs, and two carloads of Virginia Lambs at 9c per lb. Dressed mutton well sustained in price and selling at 8½@10c; Dressed Lambs higher and quoted at 12@16c.

HOGS.—Feeling a trifle easier, and common to good Hogs may be quoted at $4 70@$5 10.

MABEL WHITNEY'S LESSONS IN FARMING.

BY G. C.

"OH I know," said Dora, "when we first came here, papa bought the binful of ashes, and those bones were all through them".

"My papa," said Mabel, "has a little mill that he grinds bones and shells with; but some of these bones will mash with a hammer. If you have an old pan that doesn't leak, fill it with the bones and put them in the oven, and bake them until they will mash easily. Then give them to your hens, and maybe they will soon lay you eggs enough to buy a bone mill. Papa buys beef bones by the barrel, of the butcher."

"Miss Whitney," said Dora, who was somewhat amazed at Mabel's wisdom, "were you ever poor?"

"Not very," laughed Mabel, "and I never will be if I can help it."

"You have such ideas of economy, and you know just what to do," said Dora.

"I am only endeavoring to think for you, Dora," replied Mabel. "My father is a thorough farmer. Nothing goes to waste. Everything is taken care of. No decaying vegetables are allowed to lie around. Everything is kept perfectly clean. He scarcely ever has a sick animal of any kind. His neighbors call him lucky. Mamma says it is care and good management."

"We have sick animals enough," said Dora, "We haven't a pig. They have all died for the last three years. They have good feed, too, and a good house. It is quite old, but it is comfortable for them."

"Perhaps the pig-house is what is the matter," answered Mabel. "If our pigs died that way, papa would tear the pig-house all down, and build a new one somewhere else, and would not use a single board of the old one to build the new one with."

"What would he do if he hadn't any boards to build a new one?"

"I don't know," said Mabel, whose confidence in her father's abilities seemed to be unbounded. "He would manage somehow, likely take old rails or slabs, fence in a corner of a field, build a shed of rails, and cover it with hay or straw."

"The longer I live," said Mrs. Early, who had been a silent listener to the conversation between Mabel and Dora; "the more I am convinced of our ignorance, and what a vast amount we have to learn. We moved here with such bright hopes, expecting that everything that the earth could bring forth would soon be ours, never dreaming of the amount of knowledge and skill required to make even an ordinary farmer. Last spring a man frequently came by here selling early vegetables—radishes, young onions, lettuce and asparagus, looking so green and refreshing, and we with nothing of the kind of our own, and no money to buy those tempting things with. I thought I would gladly give all my knowledge of French, embroidery, or even music, to know how to grow these things so early."

"Oh, how I wish I could exchange with you." said Mabel, all animation. "I know, with the aid of hot-beds, I could grow those vegetables as early as any one; but if I only had a piano and could play—don't you think we can exchange accomplishments, Mrs. Early? You give me lessons on the piano, and I will help you raise those vegetables in the spring."

"You! you raise vegetables!" replied Mrs. Early, with a look of astonishment. "How did you ever learn?"

"I was brought up in that kind of an atmosphere," replied Mabel, laughing, "and besides, we take agricultural papers. Papa has taken the RURAL NEW-YORKER ever since I can remember."

"We must do so, too," said Mrs. Early, "or we can never get along. Mr. Early bought a book on vegetable gardening; but he says it takes so much money to fix things in the manner which that speaks of. But I will willingly give you instructions on the piano, Mabel, for the extra lessons that you give Dora."

"And you shall have your early vegetables, dear Mrs. Early; I will devote my mornings, evenings, and Saturdays, to music and hotbeds," said Mabel, as she followed Dora out to her chicken-yard.

Mabel knew that if reminded in season, and given plenty of time, Mr. Early would make the hot-beds for them; and she expected to get seed from her own home. But the problem of sash was not yet solved in her busy brain. She was afraid it would cost more than the Earlys could well afford, but one day, on one of her return trips from her home, she overheard two gentlemen in the dépot talking of some chicken-houses that one of them intended building; and he was told by the other that there was a lot of sash which he thought he could get cheap, of a gentleman not far from Mr. Early's. Mabel waited to hear no more, but hurried home, the chicken-house men never noticing her presence.

"All things are fair in love and war," said Mabel "and we must have those sash. That man is rich, and the Earlys are poor."

Mrs. Early was much amused when Mabel told her of her plans, and was easily persuaded to get Mr. Early—who entered into the spirit of the joke—to start at once to purchase the sash, with two or three weeks of Mabel's board money, paid in advance, in his pocket.

"I bought them cheap," he said to Mrs. Early, on returning. "I met one of Mabel's dépot friends. He asked me where I got those sash. I told him 'from Mr. Garrison.' 'Well now,' he said, 'I intended to buy those sash. I just heard of them about an hour ago.'"

Fixing and arranging the hot-beds seemed to give Mr. Early a kind of impetus in his farming; and the more he did, the more he wanted to do, Mabel throwing out a hint here and there, as delicately as possible, without appearing obtrusive. When the hot-beds were ready for the seed, Mrs. Early and Mabel said that it was their own affair. They planted the seed in due time. The sashes were partly filled with glass. Where they were not, they tacked muslin. Early in the spring Mrs. Early's table was adorned with bright, crisp radishes, and lettuce, and they were offered quite liberal prices, by their neighbors, for the vegetable plants, which they raised in the hot-bed. When peas and lettuce came, they seemed to Mrs. Early far more luscious, because they were raised on their own farm.

Mabel's father concluded that it was better for her to go to school, than to teach, so at the close of the year, she gave up her school, and bade a reluctant farewell to the Earlys.

The following is a letter received by her from Dora, the next spring.

DEAR, DEAR MABEL:

I suppose you are studying very diligently now. I am going to school. It seems so nice to be able to go.

I wish you could see mamma, now. She is getting strong and seems so happy and contented. She and I commenced bunching vegetables as soon as I came home last evening, and it took until after dark to finish. Papa took them out early this morning, and hadn't nearly enough to supply the demand. We have another row of hot-beds now, and everything that is coming looks well. We have a hired man, and mamma has a girl to help her in the house. I have 100 chickens and 20 hens sitting. Our place looks lovely, this spring. How I do love it! People all wonder at our prosperity.

That old gentleman—the trustee—who introduced you to us, said "it all came from boarding the *schoolmarm*," and, dear Mabel, I believe it.

I can scarcely wait until the time of your promised visit.

Your loving friend,

DORA EARLY.

(THE END.)

For the Young.

WHO SHALL CONQUER?

WHAT I wish to know is, is there such a thing as *making hens lay?* If so, Southern hens differ widely from their Northern sisters. Having seen the statement of "how to make hens lay," in your valuable paper, as well as a dozen other papers, I thought so much proof must be convincing, and that whenever an opportunity offered I would make the test. My hens had always laid well during winter, so that, having several dozen eggs on hand, I thought I might well dispose of them while they were 25 cents per dozen, and still collect enough for my Christmas baking, there being fully three weeks' time. But "Lady Bard" who seems to be queen of the "hen dynasty," and, who is always lurking about the house, overheard our plans and immediately communicated with her subjects, who rebelled against the outrage, and signed a pledge that they *would not* lay again until the 26th day of December, 1888. With one accord, they stopped laying. At last the golden opportunity had arrived in which I would prove to those hens whose will should rule. I subscribed for several "Poultry Journals" to help me in the grand work.

"——'s condition powders" was my first trial. I read over the directions minutely. Yes; how plausible it all seemed! I wondered any sane mind had not reasoned it out long before. I began to sympathize with those hens, thinking how they would feel after I had gotten ahead of them so easily. I prepared the medicine, gave it to them, got a cotton basket ready in which to collect the eggs; meanwhile I would read a chapter or two, to pass time, for soon the cackling would begin; then I would have enough to do. One, two, three chapters; still no hen racket. I thought I'd go and see how matters stood. The hens had finished eating, wiped their bills, and looked up with a "The-time-has not-yet-arrived" expression. Still I was not discouraged. I thought all that was required was time, and morning would surely bring success. But morning dawned, night came, still no eggs. I used the "potted meats for poultry," surely these, with the powders, would produce the desired result; but the hens only "smiled" and passed on. I used a dozen different kinds of powders recommended, but with no success. I cooked, boiled and baked for them, all to no avail. I gave them red pepper, hot victuals, cold victuals; they ate and slept, but not an egg did they lay. Some one said that scraps from the table would make hens lay. I almost starved the family in order to have enough scraps for the chickens; they ate them in payment for past services rendered, and went on rejoicing.

It was no longer the eggs, or gain to be derived therefrom, but will against will. Who should be victor? Oh! the methods of making hens lay! It's like trying the different remedies for curing a cough. I was becoming desperate, when one of my neighbors called in—the one that's always willing to let things go at a bargain, "beens't it's you," letting you have a dozen eggs for 20 cents, while she sells to a stranger for 15 cents per dozen and all such neighborly acts. Of course, I spoke of my hen trouble. She didn't know much about henology, but "knowed as hens needed gravel mighty bad at times." Yes, gravel was what they wanted. With all I had done a little gravel was needed to finish the work. "Pound fine old pieces of broken dishes." Everything in the way of a broken dish was pounded up; I even went so far as to let a few of my dishes fall and break, that I might be sure of enough. The yard looked as if I were laying out gravel walks. The hens scratched and picked but remained unmoved. "Not the right kind of gravel," some one suggested; "burnt bones," were what they needed. Come to think of it, that did seem best; so I had several carcasses brought in, some burnt and broken up. The whole place looked like a bone yard.

Strangers coming in remarked that it seemed out of place having gravel walks in a bone yard. I only smiled and said: "It was an odd fancy of mine." You see, I did not wish to explain further, until I could exclaim, "Ecce homo or Ecce henno," or something to that effect.

The bones met with a like fate of all else I had tried. Then some one suggested sand. Living near a creek where the water ripples over sand, I would have no trouble in getting that, so I had the negro boy haul sand all day. It seemed as if I were raising a sand bank—a very appropriate affair since our late storm, as no one will have need of any other kind of bank for some time to come. The sand only hardened those hens' hearts and they would not lay. Oh! what a desperate state of mind! How I longed to conquer!

What could I do next? Meanwhile the unassuming neighbor called; again I related my troubles. She said she didn't know, she never bothered about her hens; when they got ready to lay, it was all right, and when they didn't lay, she just let them alone. I thought I would not give much for one with so little ambition. The idea of letting those hens rove around at their own sweet will, while eggs were now 35 cents per dozen. But it occurred to me that every one did not know how to make hens lay. It was a knowledge possessed by only a few of the intelligent ones. I heartily sympathized with her, knowing how those hens imposed on one at once so good-natured and ignorant. Again, some one suggested lime. Lime, why that was the very thing. The shell is partly composed of lime; why had I not thought of it before and saved myself all this expense and trouble?

The hour of triumph was now surely nigh at hand. I put lime everywhere. The family on looking out in the morning began to shiver and remarked that they had no idea there had been a snow storm during the night, and "Old Probabilities" noted it down,—"The severest snow storm known in this locality for 20 years," etc. I let them find out the real truth and went to see my hens. They were all there, awaiting further trial, but the eggs were still missing. Some said: "They must roost warm." So I put them all in the hen house; I even thought of buying a stove to put in there with them, but my means would not allow it. Others said: "They will do better sleeping in the open air." So I took them all out and made them roost in the trees. Again, I heard the suggestions, they were roosting too high or too low, so back to the hen house they went. Those that were high, I put down low, and those that were low, I put up high, dragging them about several nights in order to get the right hens in the right places, but all for nothing. I went out at night to look at them; they were all sitting on the floor; the climax had come at last; they would all lay at once. On closer examination I found they had eaten so much gravel and egg-food generally, that they were unable to get on the roosts.

It's the night before Christmas. I give up all hope; all ambition has died within me. I've been conquered. Those hens signed a pledge and they kept it to the last. If all temperance pledges were kept as rigidly, what a grand work Temperance Societies would do! Christmas morning, I went out to look at those hens. They looked up at me, as much as to say: "I told you so!" That was the last feather; I could stand it no longer. I went into the house and wept bitterly over my disappointment.

It was the day after Christmas,
When all through the yard
Every hen was a-cackling,
Even old "Lady Bard."

One would have thought it Easter morning and that every choir in the United States had burst forth in one grand anthem of praise; but it was only those hens who had conquered, and were now ready to resume business.

I merely write this to warn all who are not physically strong enough to bear severe disappointments against, "making hens lay against their will." Should they be so rash, they will surely come to an early grave.

THE R. N.-Y.

ENTERPRISE, DILIGENCE, RESEARCH.

ORIGINAL IN ALL ITS DEPARTMENTS.

THE LEADING NATIONAL GARDEN AND FARM WEEKLY OF AMERICA.

SUBSCRIBE FOR THE BEST.

It will please all progressive rural people and all people sensible enough to have rural tastes.

From the N. Y. Times:

"The RURAL NEW-YORKER has done more to promote the true interests of agriculture in the way of experimenting, than all of the experiment stations put together."

From the N. Y. Tribune of Feb. 1, 1888:

"The RURAL NEW-YORKER is a paper which during its nearly 39 years of life has done vastly more for farming than nine-tenths of all the land-grant colleges and experiment stations, whose chief business is underdrainage of taxpayers."

From the N. Y. Sun:

"The RURAL NEW-YORKER is one of the ablest and best papers on rural affairs in all America. It is thoroughly practical in every department, and its constant efforts in the introduction of new seeds, plants, and implements after the most careful tests commend it to the confidence of every tiller of the soil."

From the Farm Journal, Philadelphia, Pa:

"The RURAL NEW-YORKER is the best farm weekly in the world."

From the Inter-Ocean, Chicago, Ill.:

"Readers of the Inter-Ocean do not need to be told that the RURAL NEW-YORKER is one of the best horticultural and farm weeklies published."

From the N. Y. World:

"The RURAL NEW-YORKER is the best agricultural paper in the country."

From Joseph Harris, Moreton Farm, N. Y.:

"The fact is, you are doing more for agricultural and horticultural science than all the experiment stations combined.

Specimen Copies, Posters, Premium Lists free. Price $2.00 a year. In clubs of five or over, $1.50.

Considering the cost of its publication, the R. N. Y. is the cheapest agricultural paper published.

The Rural New-Yorker,

34 Park Row, N. Y.

CATALOGUES, ETC., RECEIVED.

PENNSYLVANIA INDUSTRIES AND RAILROAD POLICY.--This is the title of an address delivered by Andrew Carnegie before the Pennsylvania legislature. It is now published in pamphlet form. It is a powerful and fearless attack upon the policy of the Pennsylvania Railroad Company, which Mr. Carnegie claims, will, if continued, cripple the leading industries of the State or drive them out of her boundaries. Some facts not now generally considered are brought out in this address. At the beginning of this century Virginia headed the list of States in population with Pennsylvania second. In 1810 New York went to the head with Virginia second. In 1820 Pennsylvania passed Virginia and the race for supremacy has since been between New York and Pennsylvania. Since 1860 the latter State has steadily gained on New York, and sanguine Pennsylvanians believe the time is surely coming when their State will lead. This belief is based upon a thorough understanding of the peculiar shape and physical characteristics of their State. It is square as a block in shape, reaching from the lakes to the sea and with the best of water courses. In fact, Pennsylvania is a small country by herself. She sweeps westward in mountain range after mountain range. The mountains supply coal and iron, and close to them comes the third great natural product, petroleum; and to this may now be added natural gas. And the farming lands of Pennsylvania are so interspersed among the coal fields and the iron mines that Pennsylvania farmers are doubly protected in their home market. The way to the markets of other manufacturing States runs over easily traveled courses, and distant farmers may bring their products over the home farms and sell them. This is changed to a great degree with the Pennsylvania farmer. The physical character of this State defends him.

It will thus be seen that the internal commerce of a State like Pennsylvania must be something enormous. And the Pennsylvania Railroad Company, by securing what amounts to a monopoly of this commerce, has welded a power for good or for ill, the magnitude of which is difficult to comprehend. The modern railroad links homes, families, towns together. It is a home enlarger. A liberal policy, that will give the public confidence in the justice and honesty of the managers is sure to become a blessing to the community and the State. A mean, discriminating policy, a disregard of public rights and fair demands, will only become a curse to the State, and will, sooner or later, injure the business of the railroad that employs it. For a number of years farmers and mechanics have been crying out against trusts and monopolies. This cry has been too vague and indefinite. The reform must *begin* somewhere. Of late, public opinion seems to be settling into the idea that we should begin the work of bringing about a fairer division of profits by placing the management of our railroads in the hands of the general government. After reading Mr. Carnegie's address carefully we are inclined to think that governmental control of the Pennsylvania Railroad would prove a blessing in several ways.

CONSULAR REPORTS.—No. 103 of these reports, issued by the State Department at Washington, contains some very interesting information concerning foreign trade and modes of living. One matter of considerable interest to American farmers is the report of our agent at the Bahama Islands. It appears that the inhabitants of these islands have in former years, depended upon the salvage received for their services in case of marine disasters for quite a portion of their income. The British Government recently erected a very complete system of light-houses on the island and as a consequence so few wrecks have occurred that wreckers are cut away from a portion of their income. It has been decided to take up the production of sisal hemp in the place of this lost industry. The hemp can be grown cheaply on the islands and just at present it is the most marketable product to be thought of. An increased production of this hemp will mean cheaper rope and twine for American farmers.

EXPERIMENTS IN HEATING GREENHOUSES — This subject is treated in a bulletin recently issued by Prof. S. T. Maynard of the Massachusetts Experiment Station. One season's experiment went to show that a hot water boiler consumed about 20 per cent. less coal than a steam boiler, while the temperature of the hot water heat was most even.

Here are some conclusions as to the protective value of various building materials. On the inside of the wall, the lined board walls, filled with shavings, gave the best results, that with the hollow space being but little less valuable. Hollow brick and concrete walls are about equally valuable in protecting from cold, but not equal to the framed and board walls. Experiments were also made with evaporated sulphur as an insecticide. A kettle of sulphur, heated to nearly a boiling point was kept in the greenhouse for three or four hours twice or three times a week. This kettle was placed on a hand stove. The sulphur must never become hot enough to take fire, and care must be taken to prevent its becoming upset. Prof. Maynard concludes as follows:

"From our own experiments and the reports of those who have used the evaporated sulphur we can recommend its use for the destruction of rose-leaf blight, rose mildew, grape mildew, chrysanthemum leaf blight, and the red spider. It is certainly an aid also in preventing mildew on the lettuce. Further experiments, however, begun earlier in the season may give more positive results, but our main dependence in the growth of lettuce under glass must be the proper conditions of temperature, moisture and plant food.

I would again advise *caution* in the use of sulphur, that every precaution be taken to avoid its taking fire, for the fumes of burning sulphur will quickly destroy all plant life, and even five minutes of burning might destroy hundreds and even thousands of dollars worth of plants."

DOWNY MILDEW AND BLACK ROT OF THE GRAPE VINE.—Bulletin No. 10 of the Section of Vegetable Pathology, United States Department of Agriculture, gives a report of the experiments made in 1888 in the treatment of these diseases. As our readers know, the Agricultural Department has for some years experimented with the various mixtures of sulphate of copper in the hope of finding a remedy for diseases of the grape. It would appear that success has come from these experiments and that there is reason to believe that sulphate of copper represents a value to the vineyardist about like that represented by Paris green to the orchardist.

TO DEFEAT THE TWINE TRUST.—This is the title of a pleasant little circular issued by Aultman, Miller & Co., of Akron, Ohio, manufacturers of the celebrated Buckeye binders and mowers. The object of the circular is to prove that the Buckeye is the cheapest and best harvester made. The main argument offered is to the effect that the various wire binding devices proposed by certain manufacturers will prove expensive instead of economical. The wire, so this circular claims, will cost as much or more than twine to which must be added the cost of the extra attachment. Again, it is almost beyond the reach of probabilities that the "Twine Trust" will be able to maintain their high prices for any length of time. The jute bagging trust has just received a black-eye from cotton planters. We are informed in this circular that twine is the material best suited for use in grain binding. The argument seems to be that it is better to stick to twine and twine binding attachments and take the ground that high prices for that product are sure to be broken.

ELLIOT'S PARCHMENT PAPER.—Circulars from A. G. Elliot & Co., Philadelphia, Pa. This firm are headquarters for parchment paper, a material which is now considered practically indispensable by good dairymen. Send for circulars, no matter whether you use the paper at present or not.

DOWN THE GREAT RIVER.—An account of the discovery of the true source of the Mississippi river, by Captain Willard Glazier, published by Hubbard Brothers, Philadelphia, Pa. This is an intensely interesting volume, and one of the best aids to the study of the geography of the Mississippi valley that we can think of. It is an account of a trip taken to the source of the Mississippi and from that point to the Gulf of Mexico.

Strange to say, there is a serious question as to whether the older explorers ever found the head-waters of the Mississippi. Indian guides carried Captain Glazier as far to the North as a canoe would float. From this point, the canoe was permitted to float down the stream, past city, town and wilderness past islands, down rapids, ever on till the great river broadened into the Gulf. It is an interesting story of a remarkable trip, told so simply and so well that it is hardly possible, to lay the book down unfinished. The price of the book, is, we believe, $2.00

PRACTICAL HINTS TO BUILDERS.—Price 10 cents. The National Sheet Metal and Roofing Co., 510 to 520 East 20th Street, New York City. This book is filled with practical hints for owners of houses or other buildings. It is of especial value to those about to build. Among other things we notice a number of very good plans for houses and outbuildings, with devices for heating, ventilating, etc., etc. It advocates the use of metal roofing—the new roofing which is destined to supersede, to a great extent, both wood and tin for pitched roofs.

HEMINGWAY'S LONDON-PURPLE CO., 90 WATER STREET, NEW YORK.—A circular giving full directions for the use of this poison, also the opinions of many well-known people in regard to it. The circular gives the R. N.-Y. credit for having been the first of the farm press to use London-purple. When it was first offered for sale we tried it very carefully beside Paris-green, and wrote the manufacturers the result. London-purple contains about as much arsenic as does Paris-green, selling for about 15 cents a pound, while the latter costs about twice as much. We prefer the London-purple because, being much lighter, it is readily held in suspension while being applied. It is also more adhesive, sticking to the foliage longer whether mixed with water or plaster. Our readers may send to the Company for the circular.

MAGAZINE REVIEWS

HARPER'S MAGAZINE for June opens with a paper on "Social Life in Russia" by the Vicomte Eugène Melchoir de Vogüé, giving an insight into the habits of life, occupations, amusements, etc., of the different classes that people this much-discussed land. Part III of "A Little Journey in the World," a novel by Charles Dudley Warner is continued in this number. Dr. William Howard Russell contributes a very interesting "Incident of the Irish Rebellion." A very entertaining part of this issue is that devoted to "Our Artists in Europe," with illustrations and short sketches of each by Henry James.—F. D. Millet, Edwin A. Abbey, Alfred Parsons, George H. Boughton, George Du Maurier and Charles S. Reinhart are the subjects of the paper. An instructive as well as entertaining paper is the one on "Montreal," by C. H. Farnham. It describes the different classes composing the population, and contains views of McGill College, Victoria Square, Montreal, from the mountain, Bonsecours market and church, the Notre Dame de Lourdes, Bank of Montreal and Post Office, and many other places of interest. "Friendly Rivalry" is a very clever fiction of the middle of the 20th century, or about the "year 50 of the Commune." In it James Sully gives us a view of the new order of things when such things as love, sentiment and kindred feelings are done away with, and the two sexes are evolved into scientific beings of perfect equality. This is Mr. Sully's first attempt at fiction.

The serial "Jupiter Lights" is continued.

Nannie Mayo Fitzhugh gives us "T'other Miss Mandy" as her maiden effort in fiction. Lawrence Hutton writes of "The Negro on the Stage," with numerous illustrations of celebrated negro impersonators.

"Quince," by Winthrop Mackworth Praed and several shorter poems by different authors are interspersed. The Editor's Easy Chair, Study and Drawer are replete with good things, while the illustrations are numerous and excellent.

THE CENTURY for June is an exceedingly interesting number. There are several articles of special interest to Americans. "The Relations of the United States and Canada," from a Canadian standpoint, is given by Charles H. Lugrin. It is a very timely paper in view of the present agitation of the subjects of annexation, reciprocity, etc.; and also as showing the attitude of our Northern neighbors on these subjects.

In "General Lee after the War," Margaret J. Preston gives us an insight into the noble character of this great man as exhibited in his beautiful, devoted home-life. In the Lincoln History several chapters on important political events are published: "The Pomeroy Circular," "The Cleveland Convention," "The Resignation of Chase." John Fraser tells us the story of "An American Amateur Astronomer," Mr. S. W. Burnham, formerly of Chicago, now chief assistant of the director of the Lick Observatory in California. He adopted the profession of stenography, and was with the Union army at New Orleans during the Civil war. While there, he purchased a second-hand Astronomy at an auction, in which he became deeply interested, and which study by the aid of a cheap telescope, he followed enthusiastically. After the war, he located in Chicago, devoted all his leisure time to the pursuit of his favorite science, and purchased a small but excellent telescope. This he mounted in an observatory constructed mostly by himself in his back-yard, which his friends laughingly called a "cheese-box." With this small telescope, rudely mounted in a back yard in Chicago, this enthusiastic astronomer discovered more double stars in the short space of two years, than all the astronomers of the world beside had discovered in 20 years. It is a story of a Yankee boy, who unaided except by his native genius and indomitable will, has placed himself in the front rank of scientists. Mr. Kennan continues his papers on Russia by giving the first article on his visit to the Convict Mines of Kara. The article is profusely illustrated the most striking pictures being those of the "Convicts at Work in One of the Kara Gold Placers," and "Convicts Returning at Night from the Mines." An illustrated article on the Bloodhound by an English writer informs us that the bloodhound is not the savage and blood-thirsty brute he is generally pictured, but is an animal of remarkable intelligence. The frontispiece of this number is a fine portrait of the famous French painter, Corot, and an article by Mrs. Van Rensselaer descriptive of his work is also illustrated by a portrait of "Corot at Work." "Certain Forms of Woman's Work for Woman" is illustrated by views of the Young Women's Christian Association Building of New York, showing the many different departments. "Early Heroes of Ireland" are described by Mr. D. E. Kay. Then there are "Memoranda of the Civil War," "Topics of the Time," "Open Letters" and numerous poems. It is a valuable and extremely interesting number.

SCIENCE, Travel, Natural History, Stories, both complete and serial, and pure fun, liberally sandwiched with poetry, make up the entertaining contents of the June St. Nicholas. "How I Saw Old Carolus," the initial article by George Wharton Edwards, tells of the big bells in the Antwerp Cathedral, which may be seen only by climbing a tower 400 feet high. "Old Carolus," so called, because given by Charles V, is "the greatest and best beloved of all the bells of Antwerp, and, indeed, of all Belgium." It is valued at nearly $100,000. The description is as interesting as a story, and as vivid as a picture, while the picture of the little maid Josephine, born in the tower, who was the writer's guide, is very quaint and sweet. Sarah Orne Jewett's serial "A Bit of Color," is concluded, leaving its readers in love with Betty, "who had a won't-you-please-like-me way with her."

"Teddy and the Wolf" tells how Teddy in his brave attempt to protect the family from the supposed material wolf, was the means of keeping from the door the figurative "wolf," that really threatened it. "Little To-bo" gives some of the quaint sayings of a bright—"*really*" child, and some of her drawings are shown. "The Goblin Storm," a Legend of Bigstoria, contains a very big story indeed, while "Bingo was His Name" gives some very funny adventures of a little brother and sister who "didn't mean to be bad." Some 35 articles make up the number, besides the Letter Box and Riddle Box.

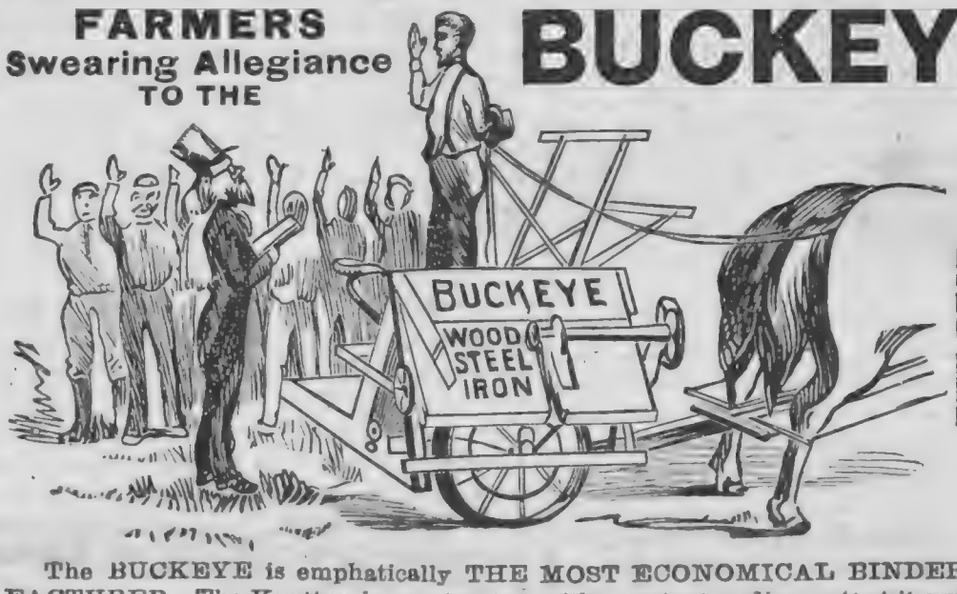
FARMERS Swearing Allegiance TO THE BUCKEYE!



THE BEST Harvesting Machine ON EARTH.

The BUCKEYE is emphatically THE MOST ECONOMICAL BINDER MANUFACTURED. The Knotter is constructed with a swinging disc, so that it can use a low grade of twine, as well as the higher grades. All steel machines with so-called "simplified knotters" lack as broad capacity in this particular. The faulty construction of all steel machines has induced their manufacturers to offer new attachments, which, they claim, are for the purpose of breaking the Twine Trust, but really to aid the said manufacturers themselves in putting a few extra dollars into their pockets at the expense of the farmer. The BUCKEYE presents no old wire binding device, or header or hand binding attachments which cost the farmer more at the end of the season than if he had used the highest priced machine. The Buckeye, with its COMBINATION OF WOOD AND STEEL AND IRON, the three essential elements of LIGHTNESS, STRENGTH AND DURABILITY, is complete and perfect in itself. There is no extra charge for its knotter with swinging disc. The BUCKEYE is endorsed by the leading manufacturers of wagons and cars in the United States, and thousands of honest sons of toil throughout the civilized world are willing to swear to its general excellence. The BUCKEYE BINDER and the BUCKEYE MOWER are a pair of machines which will render their possessor contented and happy. If the farmer desires to break the Twine Trust let him buy the BUCKEYE.

Sheep Husbandry.

A WISE MUTTON-HEAD.

THOSE who know least about the sheep are emphatic in calling it the most stupid of our domestic animals. Shepherds well know that some sheep possess plenty of sense and cuteness, and that the sheep's memory is generally better than that of any other farm animal. It requires a study of the animals to learn these facts, however; to most people sheep will always be known as small-headed, stupid, cowardly, selfish animals, fit models for that disagreeable type of humanity—the mutton-head.

While looking about the stock-yards not long ago, the R. N.-Y. artist came upon the lamb whose head is pictured at Figure 148. We consider it about the most intelligent "mutton-head" we have ever seen, and the R. N.-Y. hopes that those who see it will admit that sheep are not all the dull, woolly-brained animals that prejudice has pictured. This lamb ought to be an intelligent-looking animal. He was engaged in a work that will, if carried out, bring profit to American farmers. Though he died for the cause the flavor of his flesh may help to stimulate the demand for good American mutton to such a point that farmers will see their way clearer to meeting it. This was a "spring" lamb—a cross of a South-Down and a common ewe. He was one of a choice lot from Virginia that brought first prices and gave such excellent satisfaction that the dealers want "more from the same place."

There is a demand in all our large markets for good mutton, but it is impospossible to supply this demand for the reason that first-class mutton cannot be obtained at anything like a reasonable price. The mutton that is sold in the markets does little besides ruining its own reputation. Parties who have eaten Canadian mutton wonder why such meat cannot be found here. The fact is that too many American farmers have utterly neglected the breeding of mutton sheep. They have bred entirely for wool, and the result is that they have well-nigh ruined a very profitable meat industry. It is high time that steps were taken to stop this retrograde movement.

Rural Topics.

BUCEPHALUS BROWN'S NOTIONS AND IDEAS.

FARM WASTES.—There is a cause for everything; and there must be some sort of a cause for the general wastefulness of manure on our farms. It is not a mere occasional, accidental thing. On the contrary, if I may judge from long observations, a careless indifference, even in our oldest States, causes the practical loss to the crop of not less than one third of all the manurial matter—plant food—which is furnished in the excrements of our farm animals.

SAVING AT THE SPIGOT.—I know pretty intelligent farmers who will lose more time than it is worth in fussing with the manure of a small flock of hens, while the whole liquid evacuations of forty head of cattle run to waste upon their property.

HEN MANURE.—Do I think hen manure has no value? Not at all. It is a very good fertilizer, more or less, according to the food the fowls get; but always better than we get from cattle fed the same, because it always contains the urine of the fowls. That is what gives hen manure its excellence. I save all the hen manure I can, and throw it into the manure shed, along with the rest. I do not fuss with it at all, or mix it up to use for any special purpose, because I get all the good there is in it that way, and save time, which is money.

THE LESSON OF HEN MANURE is the lesson of saving the urine, and I wish some of these fussers with fowl dung would learn it. But it seems as impossible to make an American farmer saving of manure, as it is to make him liberal in building roads and improving school-houses. If one-tenth of the money that might be saved in the manure were to be expended on the roads and the schools, and the rest worked into the crops, the condition of the American farmer would very rapidly improve. He might even pay off that mortgage, about which we hear so much.

'PRENTICE WORK.—The great bulk of our farming is neither more nor less than 'prentice work. I mean by this that most men engaged in farming are not half educated to the business. As a rule, they know less about principles than European farmers, and not one-quarter as much about sound practice. It is too much to ask that the average farmer should be familiar with the science of farming. There is no provision yet for teaching it, even to the young. But I do say that there is no excuse for ignorance of sound routine practice, because we have enough good practical farmers in almost every township or county to teach that.

THE SCHOOL OF THE FARM.—Every well-managed farm is, or ought to be, a school for the young men employed upon it. The ill-worked farms are certainly schools of bad farming; and it is at such schools that the great majority of our young farmers are being taught "how not to do it." If they were wise, they would offer themselves to work with the best practical farmers three years for board and clothes rather than go to farming with the little knowledge they possess. They would be 200 per cent. better off, at least, in 15 years, by doing so. Besides

AN INTELLIGENT MUTTON-HEAD. Fig. 148.

that, being themselves well informed in their art, they would become centers of instruction for others; and knowledge would thus go on multiplying itself.

THE MARK OF A GOOD FARMER is easily recognized. He never wastes any manure. If you want to know what kind of a farmer you are, here is a test, infallible, by which you may try yourself. A man who has sense and business enough in him to save all the fertilizing material made on the farm, is not the man to waste it. He may make mistakes, but these very mistakes will instruct him, and be of profit to him.

A FAIR QUESTION.—"Now will you, please, tell me, Bucephalus Brown, how to save all this fertilizing material, which you say we are wasting?" I wish it were as easy to induce the questioner, who cocks his head and his eye at me, and puts this question *to do what he already knows that he might and ought to do in that direction*.as it is to answer it! The thing is very simple. Are the 17 men whose barns I passed by in a 30-mile ride, last winter, ignorant that they ought not to throw out the manure of their long cow stables under the stables' eaves, as they certainly did? Have not nineteen-twentieths of the farmers of the State in which I live who save little or no urine abundant proof of its power to make grass grow thick and dark and tall? Every spot in their pastures and fields where a cow has humped up her back is a testimony against them.

THERE ARE DIFFICULTIES.—Yes, there are lions in the path. Even some of those who have made some attempt to save and apply the liquid waste of their stables, have been disappointed in its use. Urine, and especially the urine of straw-fed stock, is by no means a complete and satisfactory manure, when used alone. The better we feed our stock, the more wasteful it is to waste their excrements; for in them is the greater part of the plant food taken out of the soil which grew that rich feed. It costs something to prepare a urine tank, as much as it costs to build a silo, and perhaps more than to build a cheap one. It costs something, too, to get the liquid on to the land. But it costs much more to let it waste.

THREE WAYS.—Urine may be carted out in a water-cart, such as is used in watering dusty streets, and sprinkled on grass stubble, either to promote the growth of the grass, or preliminary to plowing. If for grass, remember that urine, rich or not so rich in plant food, is always an ill-balanced manure. It should naturally go with the dung, and even then there is often a large deficiency of phosphoric acid, relatively to the nitrogen and potash. A plain phosphate, like ground bone, Thomas-slag, or similar material, should be used along with all stable excrements to secure the best economy.

OTHER WAYS.—The water-cart method gets it all on the land; but there are other ways, often better, to utilize this liquid. On farms where there is an excess of straw, either of the small grains or of peas, beans and buckwheat; or of poor swale or salt-marsh hay; or where sea-weed or swamp muck is good and handy, urine is a most admirable instrument for making these materials quickly into the richest kind of compost. With a compost yard handy to the urine tank, but on a lower level, properly made piles of any or all of these absorbents, singly or in mixture, may be easily moistened and kept moist from the tank, until they have, with occasional turning, become sufficiently rotted to be drawn out and plowed under. Even the stored manure, in sheds, is bettered by the same practice, which certainly should be resorted to so far as to prevent over-heating which tends to fire-fanging. There are ways enough, when there is a proper amount of will. At present the trouble is too much won't.

Dairy Husbandry.

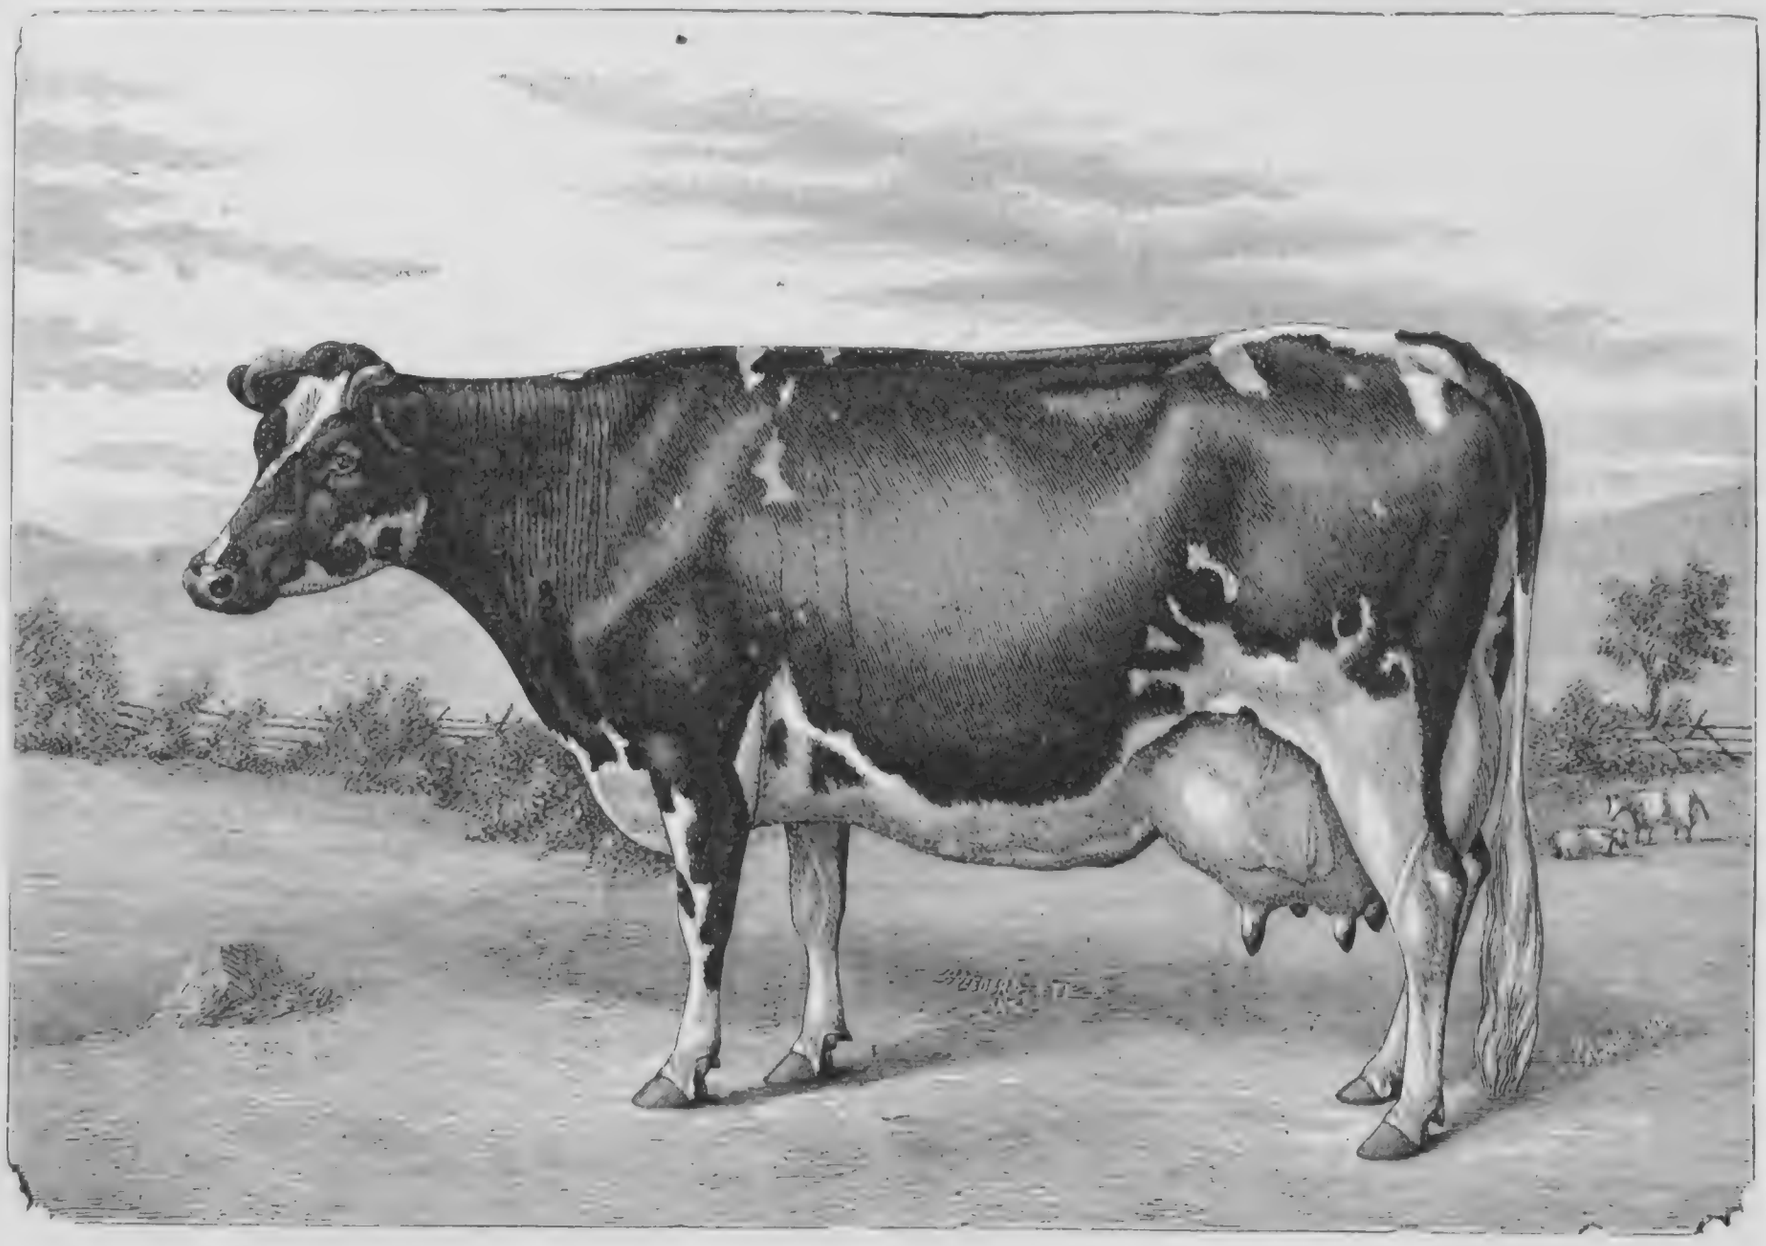
The Coming Holstein-Friesian

DAIRY vs. GENERAL-PURPOSE.

What Breeders are Working For.

OUR readers will remember that at the last meeting of the Holstein-Friesian Breeders' Association somewhat divided advice was given. Prof. Johnson, of the Michigan Agricultural College, strongly urged breeders to pay particular attention to the dairy points of their cattle. In spite of the fact that the test he had shortly before completed gave the strongest evidence of the value of a Holstein steer for beef, he was emphatic in saying that the Holstein cow was specially designed by nature to serve as a dairy machine,and that every energy of the breeder should be devoted to the task of improving the ability to make milk and butter. Prof. Morrow, on the other hand, seemed to think that the Holstein-Friesian might profitably apply for the position of "general-purpose" cow, and he therefore urged breeders not to neglect the beef points while they tried to develop dairy qualities. As this seems to be a matter of considerable interest, we have requested a number of breeders to give their views on the subject.

We are also enabled to present pictures of a typical milk Holstein, and also of a cow bred more with reference to beef points. "Lady Fay," Fig. 149, is owned by Smiths, Powell & Lamb, and is considered about the highest type of the dairy Holstein. The judges at the N. Y. dairy show, guided by the "scale of points," awarded her the highest honors, and she verified the wisdom of this judgment by winning the sweepstakes prize for milk at that show.



"LADY FAY," TYPICAL DAIRY HOLSTEIN. Fig 149.

Rhoda, Fig. 150, is owned by Mr. F. C. Stevens, who regards her as a typical milk-and-beef animal as near to the "general-purpose" standard as we are likely to get. Rhoda has always been a great milker, having a year's record of 21,309 pounds, and a butter record of 23 pounds in seven days. She is now nearly 14 years old and has ceased to breed. The greatest weight she has ever attained was 2,030 pounds.

FROM SMITHS, POWELL & LAMB.

We believe that the dairy qualities, (those concerned in the production of milk and butter) in the Holstein-Friesian breed of cattle are of paramount importance, and that they should never be sacrificed in any degree in order to secure better beef points; but at the same time we do not believe it is necessary to breed entirely away from beef qualities in order to retain or even to improve the essential dairy qualities. We believe in breeding for *butter* and *milk first*, *last* and *all the time*, and with these qualities developed in the highest degree we wish to retain all the beef points possible.

Syracuse, N. Y.

FROM J. O. BEAL.

In practice I have been selecting, feeding and breeding with the object of producing a large cow that will mature early (if these two requirements are not contradictory) with great milk and butter capacity, leaving to other breeders the task of producing the *highest-priced beef*. It seems impossible here to sell grade Holstein-Friesian steers at the same figures as grade Short-horns. I think I can make Holstein-Friesian beef as cheaply as any other kind; but 2½ cents per pound, which we get at present, is not a flattering price, and I feel that if we neglect the dairy qualities we must soon go under.

Lenawee County, Mich.

FROM F. C. STEVENS.

My advice to all breeders of Holstein-Friesian cattle is to breed so as to perpetuate the breed as they now are (taking as a standard the highest and best type); for we have in them a combination of qualities found in no other breed, and this and this only is what makes them better than any other known breed. It is their size that makes them so much more desirable than Ayrshires or Jerseys and their milking qualities that recommend them to all farmers over the Short-horn. The successful breeder of Holstein-Friesians is he who produces a cow weighing from 1,400 to 1,600 pounds, which will give 10 times her weight in milk each year.

Wyoming County, N. Y.

FROM T. G. YEOMANS & SONS.

We agree more nearly with the views of Prof. Johnson than with those of Prof. Morrow. We believe the Holstein-Friesian is the best "general-purpose" cow, and in those localities where beef qualities are more of a desideratum she can very easily be bred in that direction, but our experience convinces us that she is the greatest dairy cow the world has ever known whether for milk, cheese or butter, and we think it wise to continue to develop her in that line in which she has been so long and successfully bred.

Wayne County, N. Y.

FROM CORNFORTH & CORNFORTH.

The majority of people in this country and in this State especially, want the Holstein-Friesian to be an all-purpose cow. We aim to breed and raise good, large, well developed stock, but in so doing we do not neglect the milking qualities as we breed to the finest and best milk and butter animals we can get. We believe that if breeding for beef qualities were entirely given up, and no attention were given to breeding for large, well-formed bodies, the Holstein-Friesians would become in a number of years, small ill-formed animals such as the Jerseys.

Elbert County, Colorado.

FROM CHAS. ROBINSON & SON.

We concur fully with Professor Johnson in aiming for all the points we have already secured and in keeping the Holstein-Friesian a strictly dairy breed, continuing to improve in that line. We have plenty of beef breeds now, and only one strictly dairy breed, viz. the Holstein-Friesian. ("Let us fight it out on that line forever.") Breeders must stick to one thing if they would regard the future.

Worcester County, Mass.

FROM N. C. BARNEY.

I agree emphatically with Professor Johnson in striving to make the Holstein-Friesian a dairy cow "first, last and all the time." Breeding her for that especial purpose for generations has brought her to her present high standard. Breeding for another object, will, in my opinion, deteriorate her milking qualities. No one animal or breed among quadrupeds or bipeds can possess all of the "admirable virtues." The beef attributes of the Holstein-Friesian are now sufficient to make her pre-eminently a good "all-purpose cow." Really what purpose is served by running the risk of depreciating what we know we possess, in striving to gain something we may never acquire?

New York.

FROM JOHN A. FRYE.

This question, like all others, has two sides and while in the West it does, without doubt, pay to raise beef, I doubt very much if it can be profitably done in New England. Therefore I think it wiser for New England men to give their attention to breeding first for milk and butter, and incidentally to producing an animal that will ultimately bring a fair figure at the block.

Middlesex County, Mass.

FROM GERRITT S. MILLER.

I consider the Holstein-Friesian emphatically a dairy breed. It owes its world-wide reputation to the fact that it produces more milk, butter and cheese, per capita, than any other breed. But in addition to this remarkable dairy feature, it is the equal if not the superior of any of the beef breeds in one very important feature—that of rapid growth, (at the Chicago Fat Stock Show, Holstein-Friesians have surpassed their competitors in this respect). This combination of excellent dairy and very fair beef qualities is one possessed by no other breed in so great a degree, and intelligent breeders should not only preserve it, but strive to improve upon it, always keeping the dairy feature uppermost.

Ocean County, N. J.

A PLEA FOR SPECIALTIES.

G. W. THOMPSON.

THAT the general purpose cow has not figured favorably in the history of the past goes without saying, and the same is likely to be the case in the future. To assume that, because the cow is used for both milk and beef, therefore an agreement that "whatever is is right" would paralyze our every effort in improvement. We might as reasonably expect to produce a valuable horse for the turf, the coach and the city dray, by a careful mixing up of Clydesdale and Hambletonian

blood. How to produce such a cross I will leave to those agricultural colleges which, with no really genuine agricultural department, have been trying to represent Hamlet with the Prince left out.

If excellence is to be attained in science or art, it must not be looked for from a jack-of-all-trades; specialism points to higher attainments, leads the way and usually gets there. If our country were less continental and our resources limited, it might be a matter of expediency to have a general-purpose cow; but while we have almost unbounded cattle ranges where beef can be produced at a minimum cost, and other sections are excellently adapted to dairy husbandry, it seems to me the part of wisdom to make special effort by special means to supply the specialty the market demands, in the most perfect manner and by means of the animals best adapted to such purpose.

Our common cow, sometimes termed a scrub, is an example of the all-purpose cow. That she is capable of improvement no one will gainsay; but inasmuch as we have several improved breeds with special adaptabilities, to adopt such of these as is best adapted for our particular purpose would seem the wiser course.

The little Jersey may not be displaced. The attempt to make her a farmer's all-purpose cow has materially affected her popularity, but she is a nice little pet for those who want to keep their own cow. The beef-purpose Short-horn will surely take its place when combines are so controlled that farmers can afford to improve their fields by fattening steers, selling more on the hoof and less by the bushel. The Galloways, the Aberdeen-Angus, even the West Highlanders will perhaps adapt themselves to the rustling life of our Western ranges, and will by careful breeding or judicious crossing prove worthy of the reputation they have already attained; while no attempt should be made to divert the Holstein-Friesian from her life-work at the pail in order that she might die like a hog, for of the Holstein-Friesian cow at least, it may be claimed "she can't be wrong whose life is in the right."

Stelton, N. J.

Educational.

"What are the Agricultural Colleges Good For?"

PROF. PORTER'S ARTICLE ANSWERED.

FRIENDS OF THE COLLEGES STATE THEIR SIDE OF THE CASE.

FROM DIRECTOR CHAS. E. THORNE.

I find much in Professor Porter's article "What are the Agricultural Colleges good for?" (R. N.-Y., page 348), with which I can heartily agree; much with which I cannot agree. That the agriculture of our fathers was independent of agricultural or other colleges is true; for it was but a handicraft, and a rough one at that; but the industrial revolution of our generation, of which the railway and telegraph and the wonderful improvements in machinary of every description are but the material indications—but the natural outgrowth of that intellectual regeneration which is manifested in the progress of scientific knowledge and civil and religious liberty—this revolution does not stop at the gates of agriculture in its intellectual phases any more than in its material manifestations.
